A more clean-cut presentation of the chief reasons why socialism appeals to multitudes of the poor has never, so far as we know, been put into print, and probably nothing was further from Mr. Mack's thought and intention. In our modern complicated social system case after case arises where, in the interest of the whole community and at the demand of common humanity, a choice must be made between creating for the poor a right which they shall share with others on terms of perfect equality with others, or making them objects of private charity and thereby marking them off from others in a way that brings home to them their dependence and humiliation. American commonwealths from the beginning of our history have taken the ground that education must be regarded as a right and not as a charity. In England a large proportion of the well to do and cultivated class still believes that education should be provided for the poor as a charity, and backs up its belief with the same argument that Mr. Mack applies to the eyeglass question. Education at the expense of the general public would "smack of socialism" and a "dangerous paternalism."

We do not care at the present time to discuss the question whether, all things considered, it would be more just or more expedient or more paternalistic or more socialistic to saddle the eyeglass bill upon the public treasury than to leave it to private charity. We are merely calling attention, as we have said, to the mental operations of those who make use of Mr. Mack's argument, and upon the impulse which they undoubtedly give to the socialistic movement, while curiously imagining that they are sweeping it back with their brooms. Such thinking reveals the fact that a large class of educated men still thinks of the poor as constituting what the Englishman calls "the lower orders," and still deludes itself with the notion that "the lower orders" accept their "station in life" as proper and providential, and as carrying with it a semi-religious obligation to be grateful for charity and never bother their poor heads about such things as rights.

It just happens, however, as a mere matter of fact, that "lower orders" of this description have disappeared from the population of the United States, and that practically all the people now living here who have the misfortune to be poor would prefer not to be compelled to accept private charity. We strongly advise the gentlemen who are afraid of socialism to open their intellects to this proposition and to reflect upon it with such sapience as they can bring to bear.

"Undesirable Citizens"

They say—those that try to explain President Roosevelt's popularity—that he is a most astute politician and knows how to cater to the public feeling. He may be very shrewd as a politician, able to beat them all, just as the women teachers who went up to Albany to get their salaries made equal to the men's, proved vastly better lobbyists, on their first attempt, than the professionals. Possibly they succeeded because, without any evasion or crookedness, they went right at their point, and that is the way that Mr. Roosevelt does. But politician as he is, he seems to be perfectly free to say and do things that are likely to anger a large number of his supporters. His action on the Brownsville case has estranged the bulk of the Northern negro vote and may very well turn some States over to the Democrats at the next Presidential election, while the Southern negroes, so far as they can control the delegations, are likely to be captured for Foraker, or any one else that will only punish President Roosevelt. The President thought he was right and he went ahead, and apparently did not care if it turned every negro vote against him or his candidate.

Another case is his letter to the Italian novelist, Fogazzaro, praising his famous story and asking him to visit the United States. But that novel has been put on the Index, and the letter will offend the Catholics who so swelled the vote which elected him. The accepted politics would have kept him silent.

Equally impolitic—as politics goes—was his frank expression that Harriman and Debs and Moyer and Haywood are "undesirable citizens." Without any regard to its effect on votes the President exasperates Mr. Harriman and his very wealthy co-trustees—men who could put into a campaign against him those five million dollars which a Senator said, after the champagne, would be spent to defeat any Presidential candidate who would represent his views as to the restraint of railroad and other rich misdemeanants. And with Harriman he classed certain labor leaders who have no small following, calling them by name, and thus making them intensely angry and vindictive. When they protested, preparing to send a delegation to deal with him, he replied in one of those hard-hitting, caustic letters which he knows so well how to write, and which made them angrier, if possible, than before. Not one of their followers would vote again for him or his man; but the President does not seem to care a rap what they say or do. It is fine; it is right; he said just the hot truth; but it was not what other politicians would call good politics, for it drives off a considerable class of votes.

Yet, after all, is not frank, plain, straight-out, hard-hitting action what the people like? Do they not think they see in it the square deal of honesty? Even if he makes a mistake, as perhaps he did in the Brownsville case, do they not like the man who has positive convictions, and sticks to 'em. Is it not really high politics, which is, on the whole, better than low politics?

And who are "undesirable citizens"? Have we not here a little lesson for the people? We have been taught, largely by such philosophers as Dennis Kearney, who died last week in California, that they are the empty-handed immigrants from other lands, European and Asiatic, who come here to get a living by hard work. We have been told that their honest toil impoverishes us, and that, if they are yellow, or especially if they have a sure job engaged, they must be shut out by those whose fathers came a few years earlier. And the Dennises and Debses have talked so threateningly that Congress has obeyed and our laws are drawn up chiefly to exclude such "undesirable" immigrants. We have quite too many citizens, native and adopted, born here or who came in under our laws, who are much more undesirable; and President Roosevelt has told us who they are. They are those who plot murder to enforce the decrees of their juntas, the murder of men who will not join their agreements, and the murder of judges and governors who execute the laws. They are the sort of men who now are threatening the court which is trying the men charged with the assassination of Governor Steunenberg, and who are getting up monster processions to intimidate and defy the execution of law. There are few more undesirable citizens. These are enemies of honest labor, organized or unorganized.

No less undesirable citizens, and no less dangerous, are the Harrimans of robber finance. The President has made Harriman the example of a class. It must not be thought that Harriman is alone in the nefarious proceedings which have made his name notorious. He was not the only director who had a vote in the Union Pacific board, nor are the Harriman railroads the only sources of private spoliation. The terrible exposures made by Governor Hughes in the insurance investigation have astonished and shocked the country, and drove out of office those who had been regarded as past masters of high finance. If there are any in the country, these are "undesirable citizens." They are the men who give point and color to the tirades against thrift and wealth. They are the tyrants of business, like those other tyrants of labor, and it is their crimes that provoke and encourage the lawlessness of Debs, Moyer and Haywood.

The Red Flag or the Blue Ribbon

The vulnerable point of the Russian Government is its finance. The Czar shows no inclination to confirm the newspaper rumors by resigning, and if he did there are plenty of grand dukes ready to step into his shoes. The Cossacks are

as willing as ever to shoot or be shot at. There is no lack of office seekers notwithstanding the high premiums charged by the insurance companies on members of the bureaucracy. But the amount of money to be wrung from the people by taxation is limited, and foreign financiers are wary of advancing more money unless the Duma approves of the loan. With a heavy war debt to pay, with a constant drain upon the treasury for maintaining the semblance of order and ferreting out nests of revolutionists, with a large part of the country devastated by famine, and with commerce and manufacture crippled by strikes and hard times, the Russian Government would be practically bankrupt if it were not for one branch of the revenue which has brought in increasing instead of decreasing returns—that is, the tax on alcoholic spirits.

Marie Antoinette showed a psychological insight for which she has never received credit when she asked of those who told her that the peasants had no bread, "Why don't they eat cake, then?" That is just what the Russian people are doing now. Deprived of the necessities of life, they have taken to its luxuries. Thrown out of work, they devote themselves to play. Travelers tell us that the capital was never more gay. The higher classes are lavish in expending money on balls, theaters and dinners, and the lower classes are imitating them so far as their means permit or farther, by indulging more than ever in gambling and drink. From the latter habit the Government reaps a double harvest, the internal revenue tax on liquor and the retailer's profit, for Count Witte, the Tillman of Russia, made the sale of vodka a Government monopoly. In 1906 the vodka shops yielded a net profit of $284,219,000, and the Minister of Finance, in presenting the budget to the Duma, estimated that this year the revenue from that source would be $362,500,000. To this must be added the revenue from the tax on spirits, which in 1906 was $15,407,000. Tobacco also can be classed with vodka as a similar not indispensable luxury. The tax on this produced $24,339,000 in 1906. Altogether this makes nearly a third of the total ordinary revenue of the Russian Government, which in the same year was $1,013,929,000. The first Duma broke with the Government because it demanded that the crown domains be given to the people, yet the revenue from the lands and forests of the State was only $38,392,000, less than a tenth of that derived from the liquor traffic.

Evidently, then, the Russian people have in their own hands a more powerful weapon than assassination, strikes or mutiny. In a perfectly peaceful manner they can, if they will, throw the Government into bankruptcy and force it to grant their terms. When the Czar dissolved the Duma most of the members went to Viborg and called upon the peasants to revenge them by refusing to pay taxes. By this act they put themselves in a revolutionary attitude and ruined their political careers and risked their lives and fortunes, because it gave the Government an excuse to prosecute them in the courts and cut them off from the second Duma. By this act they accomplished nothing, for the peasants do not pay any direct taxes to amount to anything. If instead of their *jeu de paume* oath they had signed the temperance pledge and called upon the peasants to do likewise, they might have accomplished something. It is claimed that nine-tenths or ninety-nine hundredths or some such fraction of the peasants are in favor of the revolution. If so they ought to be willing to drink water for a while for the good of the cause. It would also cool their blood.

Probably it would not be necessary for them to abstain for more than a month or two. A week to show their power, as they did in the strikes of last year, might be sufficient, for the mere threat of depriving the revenue of something like $400,000,000 would produce a greater effect upon foreign bondholders than the pleadings of revolutionist emissaries and the resolutions of American mass meetings. Let the terrorists organize Bands of Hope and lodges of Good Templars instead of bunds and conspiracies. Let them import and circulate temperance tracts instead of anarchistic literature. Let them manufacture ginger ale and soda pop instead of bombs. So long as the peasants and workingmen of Russia refuse to boy-

cott the vodka shop, which is their worst enemy, both nationally and individually, they will not gain the sympathy to which the righteousness of their cause entitles them.

We began our revolution that way. Our great-grandmothers drank sage tea to spite old England. Anybody who has tasted it will appreciate their sacrifice. And the Indians of Boston threw overboard—but we do not wish to encourage any violent acts. Still it may not be treasonable to suggest that the force of personal persuasion which the revolutionists now exert on the conservatives and their recalcitrant comrades could be most profitably employed in making them teetotalers. It is better that the gutters run red with wine than with blood. Russia needs a Carrie Nation more than a Charlotte Corday.

A Country Problem

THE following letter from a professional man is worth space and a reply in the columns of THE INDEPENDENT. The writer says:

I am a professional man, with wife and four children, and have been reading the articles in THE INDEPENDENT with great interest. I can arrange my work so as to have two months' continuous vacation in the country or its equivalent in periods of two or three days scattered thruout the season. My wife and children can spend six months of the year in the country. Now, what I want to ask you is, if I should buy a farm and stock it, say, for three thousand dollars; then, after raising all the fruits, vegetables, etc., that we would need for our table, would there be enough left over to pay for the keep of a man, to run the garden and care for the horses with the cow and the chickens? I, of course, would be willing to give all my time to working on the place when I am in the country, and my wife would help in a small way. I cannot afford to buy a country place if I am to lose money on it, but if I am to come out even I can afford to do so. I have got past the time in my life when I want to spend my vacations in the country just killing time and spending money. I will get just as much pleasure and value in running a farm as in playing golf, and it will be a great blessing to the children. Can such a thing be done?

"So much depends," as the logical countryman is likely to say—so much depends on a man's makeup for work, as well as upon his executive tact, and that of his wife also, that it is not easy to give a sure reply to this letter. If you are very raw on managing things, making ends meet, looking out for trifles, etc., we shall be afraid to look at your ledger at the end of five years. But you will be an exceptional wonder if you even balance accounts for the first three years on a farm. What do you expect to raise? One hired man cannot plow and sow and reap wheat, oats, corn, potatoes and general crops of all sorts, at the same time grow small fruits, like berries and currants, and attend to the cultivation of orchard fruits, besides all sorts of marketing. While it is true that the grains can be sown the first year, you will need five or six years after planting trees before you can begin to get apples and pears; three years before you get plums and cherries, and two to three years before you get currants and berries. You will get enough for home use inside of three years, and if there is attention to bushes and trees, fighting all sorts of insect pests and fungoids, there will be a market surplus of the smaller fruits soon after that. This surplus ought to be increasing every year, but it will involve an increase of work.

You talk of horses and a cow; you had better say one horse and one cow. Unless you are a man of considerable means, as you say you are not, you must cut off the flourishes. With a trolley near by, and bicycles for all the family, you ought to be able to get around fast enough and far enough for both pleasure and beauty. "Chickens" sounds all right, and a pig might be added—we prefer, however, to double the number of chickens; but do you know that chickens will eat their heads off with ordinary and amateur care? They will lay eggs when eggs are 10 cents a dozen, and will lay off when eggs go up to 40. You have got to learn how to even feed chickens in order to get broilers or eggs.

What you do want is not what you are talking about, but something of this sort; a small place, and not more than twenty acres; half of which is immediately put to groves and orchards. Better yet, make it ten acres and work on the same plan. Then get in a good garden of small fruits, so planted that the cultivation can almost all of it be done with horse power. Besides this have a very small vegetable garden, in which you

grow the very choicest vegetables, buying those things which cost a great deal of labor to grow. If you cultivate flowers, let it be the easily worked sorts, and those that are entirely hardy, such as tropeolums and sweet peas, with a few of the choicest roses and phloxes and geraniums—these last if you have a dry soil and hot summers. A shrubbery, consisting of the finest native shrubs mainly, costs least work and gives most satisfaction. What you want in the country is to begin at the beginning and not in the middle of a big job. If you really want more land, cover it with woods and more orchards. Keep your gardens very small for the first few years, and let them grow as your experimenting passes into experience.

That is you have from ten to twenty, or possibly thirty acres; two-thirds of it meadow, orchards and groves. One acre can be divided between shrubbery and tree lawn. One-half acre can be planted to small fruits, to flowers and to vegetables. To begin with, you may plant even less than this, and will get more results than if you planted twice as much. Do not kill your ideal hired man the first year. These fellows are more often spoiled, not by hard work, but by too many kinds of work. It makes them dizzy. Your tree planting is mostly on paper as yet, and only slowly to be transferred to the land. You do a little each year. Your children must be trained up to lend a hand in every direction. There are plenty of bright lads that can be adopted into a family and trained up to usefulness. (It may cost you more hard thinking than your garden crops.)

Now with a modest beginning and economic plans you are sure of a country home. Those who undertake much more than this at the outset generally find out that they have undertaken too much. It is easy to become the slave of a horse and tied up to a cow. Plan for fun as well as work. Your groves will not net cash until they bear nuts or give you timber, yet they will be very soon grand to lie down in. A beech grove is the healthiest spot under the blue sky. The therapeutic value of some trees is not thoroly apprehended.

Take into account what nature offers. Is there a brook? Let it do what it can to give you companionship, friendship and rest; but use the water in your barnyard or to run labor-saving machinery. You must learn how to do these things and be patient to learn and do a little at a time. Get a few hobbies. Waste a little on them; but by and by make them tell. Learn how to let some things alone; for instance, such crops as your neighbors are making money with. Grow nearly all that you eat, but there will be some things that it will not pay to grow. All this while you will remember that you have not only a man to run the place, but you have got to run the man. It would be a good deal better if you had a place near the city, where you could go every night and go back to your city work in the morning.

When you locate there are three or four things to look out for, and the horticultural editor is inclined to place retirement first. What you want is to get away from folk. You need to make acquaintance with trees and plants, birds and bugs and bees. In these days there are no outlaw sections; nor outposts even. We are all linked together with rural free mail delivery, rural telephones and trolleys; you can hardly escape these if you try. Your second point of divergence from the city is to get beautiful landscape, which you can always see and enjoy. Build your house not to shut this out, but to let it in. When you come to estimate some of these points you will find that you can do what your letter says you cannot do; that is, afford to live in the country, even at considerable loss, financially. We have tried to answer your letter so frankly that you will not be misled into a plan of farming by proxy. Do not undertake to patronize agriculture; but undertake just what you can do and no more.

The Moyer Incident

In his letter of October 8th, 1906, to Congressman Sherman, the President remarked that Mr. Harriman's reported boast of his ability to buy legislatures, Congress and the judiciary disclosed "a deep-seated corruption" which made a man "uttering such sentiments at least as undesirable a citizen as Debs, or Moyer, or Haywood." Two of these

men were then in jail awaiting trial upon a charge of murder, and there was room for doubt as to their guilt. They could reasonably ask that no prejudice against them should be excited by the public utterances of a President whose opinions have so much weight with a great majority of the American people. It seemed to us that the President might with propriety admit that he had spoken hastily in a letter not necessarily intended for publication. It is quite clear, however, that he had no thought of affecting the decision in the cases of Moyer and Haywood, or of "influencing the course of justice" in the proceedings against them. This cannot be said truthfully of the numerous labor organizations which have made such a noise about the arrest and imprisonment of the two men. The President's severe criticism of them in his vigorous letter to Mr. Jaxon is well-deserved and just. It will be a blunder for labor unions to denounce this letter and to express disapproval of it by mass meetings and parades.

The Yale Corporation

Secretary Taft is not talking politics just yet—he lets his brother do it; but he talks freely on any other topic. Thus he attended a Yale Club dinner last Saturday night in Cincinnati, and talked only Yale. He happened to hit on trustee meetings, and he is a new trustee. He told them that Yale is not sectarian, even altho by charter a certain number of the trustees must be Congregational ministers, and some people have imagined that if Yale ever has a slow streak it is the fault of these clerical members. But Mr. Taft said:

"I was very much enlightened on this point at the last meeting of the corporation by a discussion with reference to the theological school at Yale—a discussion naturally carried on by the clerical members—and I was gratified to find the broad, tolerant view which was taken by all the clerical members of the corporation with reference to the liberal instruction that should be given to those seeking a theological education at Yale. My father when on the corporation had said to me that if ever I became a member I would find that the clerical members of the corporation were the most liberal ones, and I think the discussion to which I have referred fully vindicated his judgment."

Objecting to Church Union

Of course there are and will be those who object to the proposed union of the three Churches. That is to be expected, but ought not to frighten any one. Of all objections the last and least is that union will increase the number of denominations, because a few will hold out. But those remnants don't count, hardly for temporary mischief. In *The Congregationalist,* Judge Simeon E. Baldwin, Chief Justice of the Supreme Court of Connecticut, answers as follows the question what would be the effect if the action of the General Council of the United Churches in Chicago should be ratified:

"1. It will work no change in the existing creeds or standards of faith of any denomination or any church in any denomination. It establishes no new standard of dogmatic theology.

"2. It will disturb no vested interests in property.

"3. It will so unite the forces of those denominations in common Christian service that there can be confidently expected both a great gain in efficiency and a great saving of expense."

If so, there can be no valid objection to the union; and Judge Baldwin has been a potent and conservative factor in all the negotiations for union thus far, and few men are as well qualified to express a judgment as is he.

General Botha

In public as well as private affairs a generous, liberal policy pays better than a timid and suspicious one. A most admirable example is in the liberty of self-government given by Great Britain to the Transvaal, as a result of which General Botha, a principal Boer leader in the South African War, is now Prime Minister, and is visiting London with the Prime Ministers of other colonies, and is received with the warmest expressions of regard. Yet the self-government given to the States with which Great Britain was at war was bitterly opposed, and it required courage and faith for the Liberal Government to trust the people with whom it was so lately in conflict. General Botha expressed the gratitude of his people in a brief address in reply to the Minister of

War, at a dinner given to the Prime Ministers. He said:

"The manly, courageous confidence shown by the British in the people of the Transvaal is the best seed ever sown in South Africa. We will prove by our acts that we are worthy of this confidence. Our Government is as jealous of the honor of the British flag as any other colony of the Empire. The message from the Transvaal is that she wants to strengthen the bonds of co-operation and love and unity of the Empire."

It is with a people as with individuals; giving them trust makes them trustworthy. This is a lesson which the Conservative governments of England have never been able to learn in their treatment of Ireland. They have engendered nothing but hatred. Gladstone's proposal to trust Ireland with a local parliament the Conservatives would not allow. Now this Liberal Government is determined to trust the Irish people, and only in that way can the long feud come to an end, a feud which involves the good will of the United States and of Australia, as well as of Ireland itself.

In a statement recently issued, the Railroad Commission of New York directs attention to a remarkable increase in the number of broken rails on the roads in this State. For the three months ending with March 31 the number reported was 3,014, against only 826 on the same roads in the corresponding months of 1906, and 1,331 in the first quarter of 1905. On the New York Central the number this year was 1,244, against only 288 a year ago. It is pointed out that a majority of the defective rails found since January 1 were manufactured within the last three years. Prominent manufacturers have been moved by these figures to assert that no better rails have ever been made than those recently produced in American mills. This is not a convincing answer, nor can the figures be blotted out by the remark, heard in some quarters, that the roads seek by such statistics to force the manufacturers to produce rails by the open-hearth method rather than by the Bessemer process. Official reports of this character should cause thoro investigation.

English is fast becoming a world language. An illustration is given in Egypt by a visitor to the Christian Brothers' school work. He was told that they had been asked to open a school at Khartûm, but could not do it for lack of teachers. When he asked why not employ some of the Christian Brothers expelled from France, the answer was that "Frenchmen are of no use. The Arabs are mad to learn English and will have only English-speaking teachers." The official returns show 3,233 candidates last year to teach in primary schools. It is optional for them to be examined in either English or French, and 3,063 chose English and only 171 French. A Catholic writer, in the London *Tablet*, from whom we gather these facts, says that the American mission schools (United Presbyterian) are "excellent and ubiquitous," "apparently supplied with unlimited funds," and "certainly doing a great work for civilization." "Every dragoman and donkey boy I met in Upper Egypt told me he had learned English at one of these American mission schools."

We had the other day an illustration in a court in this city of mob violence protected and approved, such as might be expected only in Hoodlumton. An Irish play was on the stage, and ten Irishmen attended it for the purpose of violence. They hurled rotten eggs and other disagreeable things and made a noisy disturbance until they were arrested; but the judge dismissed the charge on the ground that the play was "indecent," "vulgar" and "shocking in the extreme," and a performance such as no Irishman would sit still and witness. Then why did they witness it? They went there for the very purpose. They could have kept away. Their act was in principle just the same as any mob law or lynch law.

Miss Anna T. Jeanes, of Philadelphia, has given a million dollars to Dr. Washington, of Tuskegee, and Dr. Frissell, of Hampton, as trustees, but it is stated that the income of the fund will be used, not for these two schools, but for the smaller rural schools, such as are carried on by the graduates of Hampton and Tuske-

gee. It is an admirable and useful gift. Without in the least disparaging its value, may we suggest to the next large donor that, while much has been given for the lower education of the negroes, and the Southern States are giving almost exclusively to that, the higher institutions, which try to give what will make educated leaders, have been much neglected. Teachers of really competent character have to be supplied chiefly by those so-called colleges, which are even yet below full college rank, but which are the best that the South possesses, and which are supported by Northern benevolence. It is these that do the most good and are most in need.

Mr. Taft is not able to assure the Porto Ricans that they shall have citizenship. They ask for it, they have a moral right to it; but he says "there are difficulties in securing the passage of such a law thru Congress." That is true, and it is a severe indictment of Congress. Congress is unwilling to give free entrance of Philippine products into the United States, from fear that our sugar and tobacco producers may suffer an infinitesimal loss. We are not even enriched by such selfishness. There is neither altruism nor profit in our course. We do not wonder that Secretary Taft is annoyed at the repeated requests of the Porto Ricans for citizenship. He can only tell them that the President has asked Congress to give it; and he adds that they have most of the advantage without the name. But they want the name, as do we; and they have the right to ask what will later assure admission as a Territory within the United States.

It has been said that there would never be another meeting of the United Confederate Veterans, as the men are getting old and feeble, and the meeting has degenerated into a general jollification in which the veterans had only a second part. But there is a chance for it, as orders have been announced that the girls will not be invited. Every local body of Veterans has been allowed to send one or more "sponsors," or "maids of honor," and they have filled the hotels and streets, and it has been a great time for these smart young girls and their admirers, to the neglect of the old, frayed soldiers. The only way to give the old men a chance for glory and memory is to close the matrimonial market.

There is a plenty of money to be given for good causes—never more—if one goes aright for it. The last appeal is from the New York City Federation of Churches, which wants an endowment of a million dollars. This Federation has done admirable work in showing what a religious census ought to be, and it has thus strengthened not a few churches. It proposes to carry on its work by fifteen helpers on fellowships, giving them a year's work on the religious problems of a great city. There are no better business men in the city than Harvey E. Fisk, banker; President E. R. L. Gould, of the Thirty-fourth Street Bank, and ex-Mayor Schieren, of Brooklyn, who make the appeal.

Why should not Belgium want a republic? It is not strange that the people should be dissatisfied with the sort of king they have, whose character has not been impeccable, who has quarreled with his family, who has disgusted the world with his rule of the Kongo Free State, and who has now provoked his citizens by withdrawing from the Chamber of Deputies a bill after it had been adopted. The Liberal and the Socialist members have protested against this infringement, and, at a meeting of the Workmen's party, speeches were made favoring such a republic as exists in France. It may come.

"Imperial unity, coupled with and based on local autonomy," is what Premier Laurier tells the Home Government that Canada and the other colonies want. True; then why not allow as much to Ireland? Indeed, a bill to establish an Irish Council is to be introduced in Parliament next week, and an Irish Council will be a sort of Parliament. Now, here are the Polish members of the Russian Duma asking for such autonomy as Finland has. That is not a bad way to initiate reforms for the whole Empire.

BROADWAY FAÇADE.

SIDE ELEVATION, CHAMBERS STREET.

The Chemical National Bank and Its New Building

THE Chemical National Bank, one of the oldest and most conservative banking institutions, has just yielded to the modern custom of providing banks with new banking houses. The Chemical's new building is perhaps the finest of its kind in the United States. It is located on the site of the bank's old quarters, No. 270 Broadway, where it has done business since 1849. Before that the bank was at 216 Broadway, where it began business in 1824. The bank was an outgrowth of the New York Chemical Manufacturing Company, which came into incorporated existence in 1823 for the purpose of manufacturing drugs and chemicals. Granite, with Pavonazzo, Chippelino, and white-veined statuary marbles quarried in Italy, enter largely into the building structure, the fittings of which are in bronze. The whole has an exceedingly simple, but very rich, finish. For many years the Chemical had larger deposits than any other bank in the United States. Its stock is today the highest priced of all bank stocks in this

GENERAL VIEW OF BANKING ROOM.

country. The original capital of the bank was $300,000, which was increased only last January to $3,000,000. The bank's present surplus fund is $5,000,000, and it has undivided profits of $364,710.59. The bank's gross assets, according to its most recent statement, are $38,568,256.85. William H. Porter is president of the bank, J. B. Martindale vice-president, and Francis Halpin cashier. The directors, in addition to the president and vice-president, are Frederic W. Stevens, W. Emlen Roosevelt, Augustus D. Juilliard, George G. DeWitt and Robert Walton Goelet.

THE NATIONAL SHAWMUT BANK OF BOSTON.

.

....The National Shawmut Bank of Boston, which until 1898 did business under the name of The Shawmut National Bank, formally opened its new building in Boston on the 1st of April. A picture of the building, which has many interesting and very attractive architectural features, is printed on this page. The bank has a capital of $3,500,000, a surplus fund of $4,000,000 and undivided profits of $618,372.93, which gives the bank ample resources with which to do a conservative and strictly legitimate banking business. Many Boston banks have been merged into the Shawmut Bank, including:

The Boston National Bank, The Eagle National Bank, The Columbian National Bank, The National Bank of North America, The National Revere Bank, The North National Bank, The Market National Bank, The Harvard National Bank, The National Bank of the Commonwealth, The Second National Bank, and The National Exchange Bank.

The officers of the Shawmut are: James B. Stearns, president; Francis B. Sears, Harold Burdock, Abram T. Collier, vice-presidents; and Frank Barbour, cashier.

....John C. Winston, the head of the publishing house of John C. Winston Company, has been elected president of the People's Trust Company, of Philadelphia, whose authorized capital is $750,000.

....The Knickerbocker Trust Company has published an instructive pamphlet concerning the devolution of real and personal property, transfer taxes on the property of decedents, and the administration of estates.

....In 1905, a recent Census bulletin says, there were 104 petroleum refineries in this country. They were capitalized at $136,280,000, and the value of their output was $175,005,000.

Insurance

The Constituency of the New Board of Trustees of the Mutual Life

THE newly elected Mutual Life board of trustees met last week and re-elected Charles A. Peabody president and Emory McClintock vice-president of the company. The board of trustees, as the result of the election just decided, is composed as follows, viz.:

John W. Auchincloss, New York, merchant; trustee of company since 1885. George F. Baker, New York, president First National Bank of New York, trustee since 1879. Hugo Baring, New York, banker; recently elected trustee. Charles S. Brown, New York; recently elected trustee. Dumont Clarke, Dumont, N. J., president American Exchange National Bank of New York; trustee since 1902. Frederic Cromwell, Bernardsville, N. J., formerly treasurer of the company; trustee since 1880. Cyrus H. K. Curtis, Philadelphia, Pa., president and director Curtis Publishing Company, publishers *Ladies' Home Journal* and *Saturday Evening Post*, director Merchants' National Bank; newly elected. Julien T. Davies, New York, counselor at law; trustee since 1882. Charles D. Dickey, New York, Brown Bros. & Co., bankers; trustee since 1896. William P. Dixon, New York, counselor at law; trustee since 1884. H. Rieman Duval, New York, president American Beet Sugar Company; recently elected trustee. Charles R. Henderson, New York, Henderson & Co., bankers; trustee since 1883. Augustus D. Juilliard, New York. A. D. Juilliard & Co., dry goods commission; trustee since 1888. Major Wm. H. Lambert, Philadelphia, Pa., formerly general agent for Pennsylvania of the Mutual Life Insurance Company of New York, president of the Department of Charities and Correction, Philadelphia, 1892-9, director of City Trusts (Girard Estate, etc.), director Philadelphia Trust Safe Deposit and Insurance Company, Western National Bank, member the Union League Club (director and secretary), the Art Club, manager Saving Fund Society of Germantown and vicinity; newly elected. Harlow N. Higinbotham, Chicago, Il.; newly elected. James N. Jarvie, Montclair, N. J., Arbuckle Bros. Coffee Company; trustee since 1896. Charles Lanier, New York, Winslow, Lanier & Co., bankers; trustee since 1899. Sir Hiram Stevens Maxim, London, England, member of well known gun manufacturers, Vickers Son & Maxim; newly elected. Emory McClintock, Morristown, N. J., vice-president and actuary of the company; recently elected trustee. George P. Miller, Milwaukee, Wis., counselor at law; recently elected trustee. Theodore Morford, Newton, N. J., president Sussex National Bank of Newton, N. J.; trustee since 1886. Thos. M. Mulry, New York, president Emigrant Industrial Savings Bank, of New York; recently elected trustee. Charles A. Peabody, New York, president of the company; recently elected trustee. Emile Oscar Phillippi, Paris, France, merchant; newly elected; Alfred M. Shook, Nashville, Tenn; newly elected. Leroy Springs, Lancaster, S. C., capitalist; recently elected trustee. George C. Rand, New York, member of firm of Hard & Rand, coffee merchants; recently elected trustee. Louis Stern, New York, merchant; recently elected trustee. Henry W. Taft, New York, counselor at law; recently elected trustee. Benjamin F. Tracy, New York, formerly Secretary of the Navy; newly elected. Wm. H. Truesdale, Greenwich, Conn., president Delaware, Lackawanna and Western Railroad; trustee since 1900. Cornelius Vanderbilt, New York; trustee since 1902.

CABLES from St. Petersburg state that an unnamed American insurance company has sent circulars to the members of the Duma in the attempt to interest them in life insurance. These circulars call attention to the many recent casualties that have occurred in Russia, and mention thirty-one prominent victims of the Terrorists during the past three years. Among those whose families have benefited by means of the insurance principle applied through the circularizing company were Minister von Plehve and Baron Meydel, whose beneficiaries have been paid the amounts of their respective policies.

SOME of the ways whereby plate glass is broken are tabulated by the Pennsylvania Casualty Company as follows, viz.: Settling of building, expansion or contraction of frames, defective setting, warping of frames, high winds, sleet and hail storms, slamming of doors, falling of various objects against the glass, including awning fixtures, step ladders, etc.; window cleaning casualties, runaway horses, reckless automobilists, drunken and fighting men, ball playing in the street, pistol shots, bean shooters, stones thrown by children, stones struck by horses' hoofs, stones snapped from under the wheels of traction and other speeding cars, snowballing, malicious mischief, careless employees, and the fool with his diamond, not to mention a long list of other "moving causes."

The Independent

VOL. LXII NEW YORK, THURSDAY, MAY 9, 1907 No. 3049

Entered at the New York Post Office as second-class mail matter.

Survey of the World

National Politics

Owing to the utterances of prominent men in favor of his renomination, the President is said to be considering the expediency of repeating the declaration which he made in 1904. At the White House, a few days ago, to several persons who predicted that the delegations from their respective States would ask and vote for his renomination, he said: "If I were to accept a renomination after what I have said on the subject, I should be historically disgraced." Henry Watterson asserts that at a meeting of journalists last winter the President made the following remarks:

"Why can't you trust me? I tell you that if the next National Republican convention nominates me and adjourns it will have to reassemble, because I will not accept the nomination."

A letter asking for the views of Republicans, "whether for or against President Roosevelt," and for other information, was sent to 3,500 men in the State of New York by the League of Republican Clubs. Speaking of the 2,138 replies, the League's president says that in all of them it seemed to be taken for granted that Mr. Roosevelt would not accept another nomination, altho nine-tenths of the writers desired that his policies be carried forward. Secretary Taft has formally been placed in the field by the managers of his canvass in Ohio, who are completing their organization and appealing to local politicians by letter and otherwise. It is now asserted that a majority of the members of the Republican State Committee are in favor of the Secretary's nomination, altho nearly three-fourths of them were claimed by the opposition a few weeks ago. Senator Dick, George B. Cox and other friends of Senator Foraker, have recently argued against any such test at the primaries, this year, as was proposed by the Senator, and the latter now explains that he never desired or suggested that there should be a primary test before the elections of November next or in connection with them. It is said that the negroes and the organized working men of Ohio oppose the candidacy of the Secretary. His friends are confident, however, that he has already won the support of his party in that State.

Railway Questions

It is expected that several prominent railroad companies will cause a valuation of their physical property to be made by experts, thus forestalling a similar valuation by the Interstate Commerce Commission if the Commission should decide to make one. It seems to be admitted that President Mellen (of the New York, New Haven & Hartford road) and some other railway officers think that there should be such an appraisal, and that Mr. Stevens (recently Chief Engineer of the Panama Canal) has really been employed to do the work on Mr. Mellen's road. The assertion is made that many roads are undercapitalized, and that proof of the fact will assist in marketing additional stock or bonds. Valuations having been made, there will rest upon the Government the

burden of proving that they are excessive. There is some discussion of the question whether the present value or the original cost of terminals and land should be accepted. Evidently the companies will accept the present value. In some instances, land acquired as a gift from communities is now worth many millions. The cost of replacing existing terminals in large cities would be enormous. It is understood that valuation is one of the subjects to be considered by the President in his address on the 30th. Another is the supervision of issues of securities hereafter to be made. It is noticeable that President George J. Gould recently said that he would not oppose a judicious supervision of new securities by the National Government. ——During the recent Harriman investigation there was disclosed an agreement, nearly four years old, between the Southern Pacific and the San Pedro (Senator Clark's) road, binding the latter to adopt the rates of the former, and not to change them without the former's consent, for a period of ninety-nine years. This was held to be a clear violation of law. It is now announced that the agreement was cancelled on April 15th. Mr. Harriman was not questioned as to this subject, and therefore he did not acquire immunity from prosecution. It is said that the Commission intended to prosecute. The penalty for the offense alleged to have been committed may be both fine and imprisonment. The Department of Justice is soon to ask the courts for an order requiring Mr. Harriman to answer the Commission's questions which he refused to answer during the investigation.——In the rebate cases against the Beef Trust, the judgment of the lower court has been affirmed by the Circuit Court of Appeals, which rejects the pleas of the defendants. This is the first case of the kind to be decided on appeal, and the decision probably foreshadows the action of the court upon those which are to follow.——The Atlantic Coast Line refused to obey an order of the North Carolina Commission that it should make a connection with another road at Selma for the convenience of the public, upon the ground that the resulting passenger business would be done at a loss. At Washington, the Supreme Court now upholds the Commission's power to enforce such an order, saying that a road may be compelled to furnish adequate facilities to the public even if as an incident there be some pecuniary loss on that part of its service directly involved. The decision is regarded as one of considerable importance in its bearing upon the power of a State Railroad Commission.——It is expected that several companies will test in the courts the recent railway legislation of Minnesota, which includes laws reducing passenger and freight rates.

The Idaho Murder Cases

At a meeting of the Central Federated Union of New York City on Sunday last, a committee appointed to call upon the President and to talk with him about his criticism of Moyer and Haywood reported that they had had a frank conference with the President for an hour and a half, and that he had prepared a letter addressed to their chairman. It appeared when this letter was read that the greater part of it was an extract from another letter, written by the President on March 25th, 1906, and addressed to the Attorney-General, in which he urged that Moyer and Haywood should have "exact justice." He wrote as follows:

"Our duty is (if it should ever happen that we had any power in the matter) to see that exact justice is done these men. There must be no condonation of lawlessness on our part, even if the lawlessness takes the form of an effort to avenge the wrongs committed by the lawlessness of others. The sole question as regards Haywood and Moyer must be the question whether or not they can be shown to be guilty of this particular act, and their legal rights must be as carefully guarded as those of any other men. It is alleged that they were extradited from Colorado in a manner that amounted to a betrayal of their legal rights. I should like to have the District Attorney of Colorado, and, if necessary, the District Attorney of Idaho, give me such information as they can on this point."

He also wanted to know, he said, whether the authorities of Idaho were disposed to act unfairly, and, on the other hand, whether there was "any symptom of a miscarriage of justice" in favor of the accused. He continued:

"The intemperate violence with which Socialistic or labor papers like that of Debs, and, I am sorry to say, some other labor organizations, have insisted without any knowledge of the facts upon treating these men as martyrs to the cause of labor, has unquestionably resulted in tremendous pressure being brought to bear upon the authorities of Idaho to discharge or acquit them, whether guilty or innocent.

"So far as the unions are anxious only to see that exact justice is done these men, that they are given their full legal rights and not condemned unless proved guilty of this specific act, they are entitled to the cordial co-operation of all just and fair-minded citizens. So far as by any action or by murderous and treasonable language, such as that quoted above from Debs (and others), they tend to bring pressure to bear upon the State authorities and the courts to obstruct the course of justice and to render it difficult to convict the men, if guilty, they are equally without stint to be condemned; and anything that the Federal authorities can do in either event to further the cause of justice is to be done."

Following this extract, the President wrote to the committee's chairman that if any one could show that there had been a miscarriage of justice for or against Moyer or Haywood, he would at once lay the evidence before the Attorney-General for such action thereon as it might be within the power of the Federal authorities to take. After the letter had been read, the President was commended by members of the committee and attacked by Socialists. Those who applauded the President's name were clearly a majority, and the report was accepted.——The trial at Boise will begin on the 9th. Already there are many newspaper correspondents and other visitors in the city. Some addition to the forces at the military post has been made, owing to threats of violence.—— About 20,000 persons took part in a parade of protest in New York on the 4th. A majority of these were said to be Socialists. At the close of the parade there was a mass meeting in a large hall, where speeches in defense of the Idaho prisoners were made by Socialists of local prominence.

The Harrisburg Capitol

As a result of the long investigation concerning the furnishing of the new capitol at Harrisburg, Pa., civil and criminal suits will be brought by the Attorney-General of the State against several persons. Among those involved in the scandal are John H. Sanderson, to whom a very comprehensive contract was awarded; Joseph M. Huston, architect, and James H. Shumaker, formerly superintendent of grounds and buildings. The cost of the building was about $4,000,000, and $9,000,000 more was expended upon the furnishings. We have heretofore shown the extraordinary prices paid for painting the walls, for chairs, chandeliers, etc. The experts employed now estimate that Sanderson's profits on the $5,556,785 paid to him were $3,500,000. In the $2,000,000 paid for metallic furniture there was a profit of 500 per cent. Governor Pennypacker was president of the board that had charge of the work and was a party to all the contracts for furnishings. Last autumn (while he was Governor) he issued a statement saying that not a dollar had been misspent, that the building could not be duplicated for $13,000,000, that no bill had been finally settled until the articles to which it related had been measured and weighed, and that the accuracy of every bill had been certified by Huston and Shumaker. Governor Pennypacker's notorious law for muzzling the press was repealed last week.

Treaty Ratified in Santo Domingo

The treaty with Santo Domingo, ratified at Washington on February 25th, was ratified on the 2d by the Dominican Congress. We have heretofore explained this agreement, which marks a new departure in the relations of the United States with the smaller American republics. It provides for the appointment, by the President of the United States, of a receiver to collect the republic's customs revenue and apply a large part of it to the payment of the republic's foreign debt. This debt has been scaled down to $17,000,000, and the old bonds are to be covered by a new loan of $20,000,000, at 5 per cent., soon to be issued in New York. The receiver is to apply to this debt $100,000 each month, or $1,200,000 per annum, $1,000,000 of which will pay the interest, while the principal will be reduced by the remaining $200,000, or by a greater sum if the entire revenue exceeds $3,000,000.

Last month's receipts were about $300,000. Our Government undertakes to protect the receiver. Santo Domingo agrees that it will not increase its debt or change its customs duties without the consent of the United States. Owing to opposition caused by the publication of a letter from Senator Heyburn, of Idaho, it was feared a short time ago that ratification would be prevented. In this letter, which was addressed to W. L. Bass, an American planter in Santo Domingo, it is alleged that the Senator said:

"I favored the treaty because it was one step toward annexation. I regard the island as a natural and desirable picket post for the United States, lying in front of the Isthmian Canal and in the line of travel between our Atlantic seaboard ports and the canal. I hope that the treaty will be a step toward annexation."

Mr. Bass distributed thruout the island facsimiles of the letter, the result being that hostility toward American influence and the treaty was excited.

Guatemala Offends Mexico

Interest in Central American affairs has been shifted from Nicaragua and Honduras to Guatemala and Mexico. The two men from Guatemala who assassinated ex-President Barillas in Mexico City having confessed, while under the influence of superstitious fear due to the recent earthquake, that they had been hired and commissioned to do the deed by General José Maria Lima, Mexico demanded that Lima be arrested and held for extradition. Two days later (on the 29th ult.) the Guatemalan President, Cabrera, narrowly escaped assassination in his capital. A mine (at the end of a tunnel extending under the street from the cellar of an adjoining house) was exploded under him and his carriage, killing his horses and wounding his Chief of Staff. Search for the assassins was made in the Mexican Legation. For this act Guatemala apologized on the 3d, but on the 4th President Cabrera refused to give up Lima, who is said to be his chief adviser and supporter. It is asserted that the late ex-President Barillas was at the head of a revolutionary junta which had planned the overthrow of Cabrera. At last reports, Mexico was about to sever diplomatic relations with Guatemala, and had moved 10,000 troops to the border.

Pursuit of Lawbreakers

It is admitted by Detective Burns, who has assisted Prosecutor Heney in unearthing the municipal frauds at San Francisco, that Mayor Schmitz has made a partial confession and has thus sought immunity. The testimony of Police Captain Mooney before the grand jury has shown that disorderly houses and gambling houses were protected by weekly payments to police officers of the several ranks according to a regular schedule of graded rates. For some time Prosecutor Heney has been engaged in tracing the money alleged in the indictments to have been paid for the street railway overhead trolley franchise. It is now announced that he has succeeded in laying before the grand jury a complete record of the movement of $325,000 from New York to Ruef and other recipients of it.——As a result of an investigation made by the Chicago Civil Service Commission as to charges that the police force in that city was required to pay assessments to a campaign fund in the interest of Mayor Dunne before the recent Mayoralty election, indictments were found last Saturday against John M. Collins, formerly Chief of Police; William L. O'Connell, formerly Commissioner of Public Works and chairman of the Democratic Committee; Edmund H. Roche, City Purchasing Agent; Frank D. Comerford, formerly police attorney, and two detectives.——In Portland, Ore., on the 3d, F. P. Mays and W. N. Jones, formerly State Senators, who were recently found guilty of conspiracy to steal public land, were sentenced. Mays was fined $10,000 and sent to jail for four months. Jones's fine was only $2,000, but his jail term is eight months.

Cuba

Much has been said in the daily press about an affray in Santiago, on the 30th ult., between sailors of the United States cruiser "Tacoma" and the police of that city. It appears that about fifteen sailors who had attended a banquet in a café were returning at

2 a. m. to the wharf and their ship. They were unarmed. In the fight that took place eleven of them were injured, and one, named Lee, suffering from a fractured skull and a pistol shot wound, may not recover. Revolvers and machetes were used by the police, who were commanded by Captain Lay. Among the injured was Ensign Brisbin. An official report from the "Tacoma" says that the sailors were "attacked." On the other hand, it is asserted in an official report from the authorities in Santiago that Brisbin and the sailors were the aggressors. It is admitted, however, that revolvers were used without necessity, and the authorities ask for the indictment of Lay. Governor Magoon says that the affair has no political significance and that the attitude of Santiago toward Americans, sailors and others, is friendly. Reports to the contrary have been published.——The plan for a standing army of 12,000 men, suggested by the General Staff at Washington, is opposed by all parties. A moderate increase of the numbers of the Rural Guards is predicted.

The Imperial Conference

The request of the colonial premiers for a preferential tariff with the mother country has met with a definite and decided refusal from the British Government. Having thus failed in what they regarded as their principal object, some of the premiers openly declared that there is no use in remaining in London any longer. The Hon. Alfred Deakin, Premier of the Commonwealth of Australia, presented the argument for colonial preference in a statistical speech of several hours in length. He argued that if the British Empire is to remain together there must be a greater degree of co-operation among its members, and their trade relations with each other must be improved. Since 1880, he said, the

THE COLONIAL CONFERENCE OF BRITISH EMPIRE PREMIERS.

From left to right, Sir J. G. Ward (New Zealand); Sir W. Laurier (Canada); Sir H. C. Bannerman (Natal); Lord Elgin (Colonial Secretary); Hon A. Deakin (Australia); Dr. Jameson (Cape Colony); General Botha (Transvaal); Sir W. Lyne (Australia).

trade of Australia with England had decreased from 75.8 per cent. to 62.5 per cent., while trade with foreign countries had increased from 12.2 per cent. to 26.9 per cent. Australia now supplies England with $50,000,000 a year, but she could furnish $1,065,000,000, of which foreigners now get $800,000,000. In his opinion a threat of retaliation would be sufficient to prevent foreign nations from discriminating against Great Britain as they do now. Mr. Deakin was supported by Dr. L. S. Jameson, Premier of Cape Colony; Sir J. G. Ward, of New Zealand, and F. R. Moor, of Natal. Sir Wilfrid Laurier, Premier of Canada, stated that the position of Canada was the same as it was in 1892, and that she was content to adhere to the solution then reached. General Botha took a different attitude from his South African colleagues. He declared himself uncompromisingly opposed to a commercial agreement within the empire, because it was an attempt to rob the colonial governments of their freedom in managing tariff matters for themselves. He believed that each Government could regulate trade to suit itself by imposing duties against goods from Great Britain or any other country if they thought best. In reply to the proposal for a preferential tariff, Herbert H. Asquith, Chancellor of the Exchequer, said that while the colonies might hold preference vital to their interests, His Majesty's Government held free trade as vital to the interests of the United Kingdom, and could not accept anything undermining that policy, even experimentally. Preferences would involve setting up a new system of duties, which would be an infringement of the root and principle of free trade. A suggestion made by Sir Wilfrid Laurier, that the same object could be attained by subsidizing imperial steamship lines between England and Canada, and Canada and Australia, is being considered by the Cabinet. This would reduce the time between Australia and England to twenty instead of thirty days, and freight rates accordingly, thus diverting some of the traffic now going to New York. Ex-Premier Balfour, leader of the Opposition, who long hesitated to adopt Chamberlain's protection policy, has now come out decidedly in favor of a preferential tariff. He said he was satisfied that a preference policy would ultimately be adopted by this country, and emphasized the necessity for "speedily translating the sentiment of brotherhood into practical action" by accepting the proffers of Canada and other colonies of preferential treatment for trade within the empire before the latter is drained of its vital strength. The colonial Premiers inspected the naval vessels assembled at Portsmouth, taking an especial interest in the new "Dreadnought," the largest and most efficient battleship afloat. The official report gives the following information about her trial trip:

"She has satisfied her creators and fulfilled all anticipations. When 80 per cent. of her guns were first fired together, with a total energy of 345,792 foot tons, some cups and saucers were broken. All else withstood the immense concussion, and the difficult problem of preventing the blast of one gun from interfering with that of another was found to have been satisfactorily solved. She has completed a voyage of 10,000 miles, and, without using all her boiler-power, maintained a speed of over seventeen knots for 3,400 miles, and could have done another thousand at the same speed."

French Labor Problems

Owing to the stringent precautions taken by the Government, the labor riots anticipated on May 1st did not occur, and the day passed off in Paris and the provincial cities with less disorder than people have been accustomed to expect of late years. The trade unions were forbidden to parade the streets, the Labor Exchange building was closed, and troops stationed at strategic points thruout the city. Four prominent members of the General Federation of Labor were arrested on April 29th charged with making speeches inciting to murder, pillage and revolution. The prosecution produced quotations from their public utterances, hinting the assassination of Clemenceau, advocating the use of violence against the Government, and advising clerks to injure the goods they sold and waiters to waste as much as possible of the food and drink they handled in order to ruin their employers. On May 1st over 1,000 arrests were made, mostly for not "moving on" when told to; only a few of the prisoners were held for trial. Twenty policemen and citizens were injured in

the conflicts between the police and the mobs which collected at several points. Jacob Law, a Russian, who claims to be a naturalized American citizen, while riding on the top of an omnibus thru the Place de la Republique, fired five shots from a revolver at the cuirassiers on guard there, two of whom were wounded. The crowd attempted to lynch him, but he was rescued by the police after suffering considerable injury. He claims to be an anarchist, and declared his intention of shooting an officer. The penalty for such an attempt is death The bakers, after having kept up their strike for twenty-one days without being able seriously to curtail the bread supply, have resolved to resume work. The employers agreed to take back the men who gave notice before going out on the strike, but refused to re-employ those who left without warning for the purpose of embarrassing their business. The strikers have sued for damages their former employers who declined to take them back, on the ground of brusque dismissal.——Premier Clemenceau has prepared a bill suppressing the General Federation of Labor because of its constant stirring up of strikes and disorder and its insistence upon the formation of militant unions among the State employees. The two Socialist members of his Cabinet, M. Viviani, Minister of Labor, and M. Briand, Minister of Education, are opposed to such action against the Federation, and it is a question whether M. Clemenceau will be able to maintain his position when the matter comes up before the Chamber of Deputies after the Easter holidays. It is estimated that the Paris tradesmen lost $20,000,000 during the last three weeks, because the tourists have been frightened away for fear of May Day outbreaks.

German Colonial Policy

The Government measure for the establishment of a separate ministry for colonial affairs, which was defeated in the last Reichstag by a combination of the Socialists and Clericals, was carried by a large majority of the present Reichstag. Herr Dernburg, a business man of American training, who is now Director of the Colonial Office, will probably be the first Colonial Secretary. In the debate on the bill, Herr Bebel, the Socialist leader, charged the Government with maintaining a large military force in Southwest Africa for political purposes. The Vice-Chancellor replied by asserting that Germany never had had any designs on the Cape Colony. Herr Dernburg stated that it was his intention to conduct colonial affairs on business lines, and to do away with the traditional bureaucratic methods as rapidly as it could be done without summarily ejecting the officials now in charge. He favored giving the men on the ground more power and freedom from interference from Wilhelmstrasse. He admitted that a reprehensible caste spirit had grown up in the colonies, but the same spirit might also be observed in the eastern provinces of Prussia. Herr Dernburg presented the report of the committee appointed to investigate the charges of cruelty and corruption made against colonial officials. Twenty-seven cases had been investigated, five officials had been found guilty and punished, eight discharged for want of evidence against them, other cases were pending. Considering that the investigation covered a period of seventeen years and the conduct of over 2,000 officials, the Government contends that the number of offenses was small. Herr Dernburg declared his intention of visiting the German colonies of East and Southwest Africa as soon as the session adjourned, to see what reforms could be instituted.——Baron Jesko von Puttkamer, who has been on trial for offenses against decency and discipline when he was Governor of the Kameruns about ten years ago, was found guilty and sentenced to be reprimanded and to pay a fine of $250. One of the charges of which he was found guilty was that of taking with him an actress, Marie Ecke, and installing her in the Government House as his cousin, the Baroness von Eckhardtstein.

Unrest in India

Considerable alarm has been excited both in India and in England on account of recent outbreaks of violence in Northern India, indicating a strong and extensive anti-British feeling among the people. The separation of Bengal into two provinces

last year was the occasion of local disorder and much speech-making and denunciation of the arbitrariness of the British Government. This crystallized into a persistent nationalist agitation and popular boycott against goods of British manufacture, the "Swadeshi movement." Now the seditious sentiment has spread into the Punjab, the most warlike and hitherto the most loyal of the British possessions in India. It is from this province that the Sikh soldiers are obtained for the policing of distant parts of the British Empire. The native press in Lahore has been endeavoring to excite the race feeling by publishing scandalous and seditious attacks upon the British administration, which finally became so outrageous that the Government was obliged to take action. The native newspaper, *Punjabi*, of Lahore, printed a story to the effect that a British officer had ordered a Mohammedan policeman to carry to camp a wild pig that he had speared, and had shot the policeman because he refused. The Government, it was said, had hushed the matter up and the murderer escaped, "as the European murderers of natives usually escape in this country where the much vaunted British justice is a delusion." The proprietor of the newspaper was arrested and sentenced to two years' imprisonment and a fine of a thousand rupees (about $330), and the editor to six months' imprisonment and a fine of two hundred rupees. The Government prosecutor showed that the story was a complete fabrication and that the policeman had been killed by being thrown and dragged by a native horse. The defense of the prisoners was that they had published the unverified rumor in good faith. The populace sympathized with the prisoners and they were crowned with garlands and given an ovation as they were taken to the prison. Afterward the procession went thru the principal streets insulting every European met. The Revising Court, to which an appeal was made, confirmed the sentence, but reduced the sentence of the proprietor to six months' imprisonment. On May 3d anti-European riots broke out in Rawalpindi, a fortified town of the Punjab, with a population of about 90,000. A mob of Hindus looted the post-office, destroyed a power house and a motor garage, pillaged a church and attacked several bungalows and residences. Troops restored order and arrested in the bazaar five Hindu lawyers who were thought to be responsible for the agitation. They are held in prison, altho two lakhs of rupees, $66,650, were offered as bail. Civilians are forming companies of volunteers in Lahore, composed of all classes, even judges of the Supreme Court, university professors and leading business men entering the ranks as privates. Rifles and twenty rounds of ball cartridge have been issued to these local volunteers. The Mohammedans are not in sympathy with the Hindus in their anti-foreign movement. They are holding mass meetings in Lahore and elsewhere, denouncing the agitation and declaring their ability and willingness to put down the Hindus by force if the British Government would allow them a free hand.

Rebellion in Morocco

Marakesh, or Morocco City, is reported to be in a state of open rebellion against the Sultan, and the tribes of that vicinity have declared in favor of his brother, Mulai Hafiz. After the murder of Dr. Mauchamp by the mob in Marakesh, the Sultan, in compliance with the French demands, ordered the removal of the Governor, Abd-el-Salam, for his failure to keep order. A new Governor was appointed, and left Tangier with his forty-eight wives and an escort of 500 soldiers, but before he reached Marakesh 370 of his soldiers had deserted and the city refused to receive him. The French occupied the town of Ujda to enforce reparation for the murder of Mauchamp, and have established themselves as firmly as if they intended to retain it permanently, as they doubtless will. The Sultan issued a proclamation, to be read in the mosques, admitting the justice of the French seizure of Ujda, and urging the people of Morocco to abstain from all violence.——A conflict arose between France and Germany over an order given to German contractors for a drainage system and marine boulevard at Tangier. The French and German foreign offices finally agreed to leave the matter to the Sanitary Council of Tangier, of which the diplomatic corps are members.

The Deeper Note

BY ALFRED AUSTIN

POET LAUREATE OF ENGLAND.

BIRDS of victorious Spring,
You know nor grief nor pain;
Sing, sing, sing!
Reiterate the strain;
To you life doth not bring
Or loss or gain.

Your unforeboding song,
With each returning year,
Is just as sweet and strong,
As silvery and clear,
As when the Attic throng
Stood, husht, to hear.

Yet something do you miss
Of what to us is lent,
The spiritual bliss,
The whispered message sent
From other world to this,
For our admonishment.

The mystery half-divined
Of "Where," when we depart,
Leaving our loved behind
Alone to bear the smart;
High melodies of mind,
Deep music of the heart.

So would I not exchange
For your my graver lot,
The wider reach and range
Of feelings you have not,
Affections fresh and strange,
And friendships unforgot.

SWINFORD OLD MANOR, KENT, ENGLAND.

NORWEGIAN NOBEL INSTITUTE, CHRISTIANIA.

The Future of the Norwegian Nobel Institute

BY CHR. C. LANGE

SECRETARY OF THE NOBEL COMMITTEE OF THE NORWEGIAN PARLIAMENT.

I.

ORIGINALITY might reasonably be expected from the inventor of dynamite. But if Dr. Alfred Nobel's fame had not been established by his invention already, he would no doubt have won worldwide renown as the great testator. Certainly, no existing legacy can compare with his in striking originality. Not only are the annual prizes larger in amount than in any other case, but also the scope and the object of Alfred Nobel's foundation are striking in their conception; he made his legacy absolutely international, declaring it to be his express desire that, in the awarding of prizes, "no consideration whatever be paid to the nationality of the candidates . . ." And there is a lofty idealism in his selection of the pursuits which are to be rewarded: The sciences of physics, of chemistry and of medicine, idealistic literature, and the utopian pursuit of preparing the millennium of peace and international good will.

The originality of the plan is borne out by the complete absence in the testament of any directions as to the organization of the foundation. Dr. Nobel only says: ". . . the capital . . . shall constitute a fund, the interest accruing from which shall be annually awarded in prizes . . ." And that is all. The simplicity is touching. For evidently, sums of some $37,000, sums that, in the Scandinavian countries, at any rate, represent prosperity, not to say more, cannot be "annually awarded in prizes" without due guarantees that worthy recipients have been found.

The statutes which have been framed for the Nobel Foundation prescribe two sorts of guarantees: First, no applications for prizes shall be taken into con-

sideration, but only such candidatures as are proposed in due form by qualified persons; secondly, these proposals are examined and reported upon by special institutions, created by and working under the control of the adjudicating corporations, while a quarter of the yearly income of each group is deducted before the distribution is made and set aside for the purposes of these institutions. Thus 25 per cent. is paid as an insurance premium that the 75 per cent. is worthily bestowed.

Such institutions are called Nobel Institutes. Two of these have been established in Sweden — one for physical chemistry, the other for literature. A third has been opened at Christiania, the Norwegian Nobel Institute, whose object is thus defined by the regulations issued for it:

"to follow the development of international relations, especially the work for pacific settlement of them, and thereby counsel the committee with regard to the distribution of the Prize. The Institute shall, moreover, work to promote mutual friendship and respect, peaceful intercourse, justice and fraternity among nations."

Thru the foundation of this Institute a way has been opened which, it may be confidently hoped, will give large opportunities of useful work in future. At present, of course, its means are rather limited, the annual income of both the committee and the Institute amounting to rather more than $12,000, besides which a sum of $80,000 was in 1900 set aside as an organization fund for each of the five prize groups under the Nobel Foundation. In the case of the Norwegian Nobel Institute, the greater part of this sum has been employed to buy a handsome site of a convenient situation, where a good building has been erected and outfitted for the work of the Institute and the Nobel Committee proper. This building was finished in 1905. Of the $12,000 mentioned above, about $8,000 are expended for the institute. The sums, as will be seen, are modest, and the present work of the Institute is very

modest, too, but there are large possibilities.

The primary duty of the Institute is to give its advice to the Nobel Committee on the distribution of the peace prize, and in 1904 three advisers were added to the staff of the Institute, one for each of the three branches of learning which are chief in importance to the movement for peace among nations—international law, sociology and political history. These three men and the secretary of the Nobel Committee each year prepare reports on the candidatures proposed for the prize.

But, of course, the Institute will be able to discharge other duties, especially if larger means are placed at its disposal. And these can be had thru a special regulation in force for all the Nobel prizes, but which is not generally known, because it has not yet been put into operation.

Any of the adjudicating corporations may rule that a prize be not distributed. It would ill serve the reputation of a Nobel prize if a person were rewarded who was not really worthy of the prize, but who had to be taken because he happened to be the *best* in a meager herd. On the other hand, the consideration of a Nobel prize will evidently be raised if it is not too often distributed. The fewer the recipients the greater the honor. On these grounds liberty has been given to the awarders to omit distribution. In this case the sum of the prize is set aside as a special fund, the proceeds of which are to be used to promote the objects of the founder in other ways than by means of prizes. Thus large capitals may be ultimately accumulated, under the Peace Prize Committee, as under the other prize groups. And there will be entire liberty to use the proceeds thru the Nobel Institutes. Indeed, this will be the most reasonable plan.

II.

What, then, may be the future work of the Norwegian Nobel Institute, the Nobel *Peace* Institute?

The modern movement for international peace progresses on two different lines of ideas, which very often are opposed to each other. It is restrictive as to war, trying to remedy the worst excesses of the prevailing war system among nations. The Geneva Convention on inviolability of wounded soldiers, etc.; The Hague Code on land warfare; the work for limitation of armaments, for inviolability in war of private property at sea, are all outgrowths of this tendency.

But the peace movement has also a constructive side of its own: Thru the calling forth of a spirit of international good will and amity; thru the creation of international offices for common interests (post, telegraph, literary and industrial property, etc.); thru the building up of an international arbitration court, of stated international congresses, the preparation of a code on international law, it is constructing the future, throwing the base of the organized international society, which we now dimly see is coming to take the place of the present international anarchy.

These two sides of the international movement are differently viewed. While the official world—diplomatists, jurists, politicians—appreciate the former only and deem the latter utopian, the peace people proper, the pacifists, are apt to

regard work of the former character as completely outside their province. According to them, the monster war should be let alone to develop all its hideous features, the evil to die from excess of evil. It has been well answered that the only certain result of this policy is the *excess* of evil.

The Nobel Committee of the Norwegian Parliament, thru its awards, has shown that it appreciates, as peace work worthy of the laurels of the Nobel prize, either side of the movement. In 1901 it divided the first prize it had to give away between the seniors of the two branches —Henri Dunant, the founder of the Red Cross and the originator of the Geneva Convention, and Frédéric Passy, "le doyen des pacifistes," the oldest and still the most impressive peace orator in Europe. And the later awards have kept the same character of neutral regard for both lines of peace work.

In this I think we may also see an indication of the future work of the Nobel Institute. In the spirit of its founders and directors, it will cultivate the work for restricting the evils of war as well as the construction of the international society of the future. It will aim at being a peace laboratory, a breeding-place of ideas and plans for the improvement and development of international relations.

With the present means of the Institute it is as yet limited to preparing its future work, to getting ready the tools for later activity. The Nobel Institute is a scientific institution, and in scientific work, outside natural science, the chief tool is a library. At present, therefore, the work of the Nobel Institute is concentrated upon creating a first-rate library, where everything should be found which may be important for the study of internationalism, of international relations in the past, of possibilities for international development in the future. The library must needs be a special library; but the field to be covered, however, is vaster than might be supposed, and with the enormous production, in this paper age of ours, of books and periodicals, it is not surprising that the library is rapidly growing.

Books in a library are a dead treasure without a complete catalog. It is the ambition of the Institute to catalog not only the books of the library, but also the important articles in periodicals, especially the book reviews, which often contain valuable criticism and supplementary matter of interest. When this work has been carried to greater perfection than is as yet possible, the library of the Institute, it is to be hoped, will be the best place for study of international problems.

Logically, the next thing to be done is the solving of such problems. There are a great many questions within the limits of what may be called the international movement in its broadest aspect, which have been only very imperfectly studied, questions both of a historic and of a dogmatic character. In the great work of preparing the international organization of the future, science should be the pioneer, not imagination and enthusiasm only. If the Nobel Institute is able to find fertile subjects and the right persons to write on them, much useful work may be done thru the "Publications of the Norwegian Nobel Institute," a new branch of work which has just been planned and to which some prominent students of international law of different

CARL BERNER,

nationalities have already been invited to contribute.

When larger means are available, scholarships may be instituted, and perhaps also a special school may be created for the teaching of the science on peace. It is not very probable that direct popular propaganda will form part of the work proper of the Institute. Private individuals and private associations are likely to undertake such activity.

But there is another task of very ambitious dimensions which may tempt the Institute, if it is ever possessed of the necessary capital.

It has several times been pointed to as a deficiency in the international organization of our time that no other courts of law are in existence than those instituted by states. This is a necessary consequence of the nature of international law, which always presupposes as its subjects organized states. International law recognizes the independence of every state, be it ever so small or ever so weak, but it does not make any attempt at controlling whether any state recognized as such is not founded thru a flagrant breach of the most evident principles of justice. It does not control the constitution of a state, nor does it examine the condition of nationalities within a state.

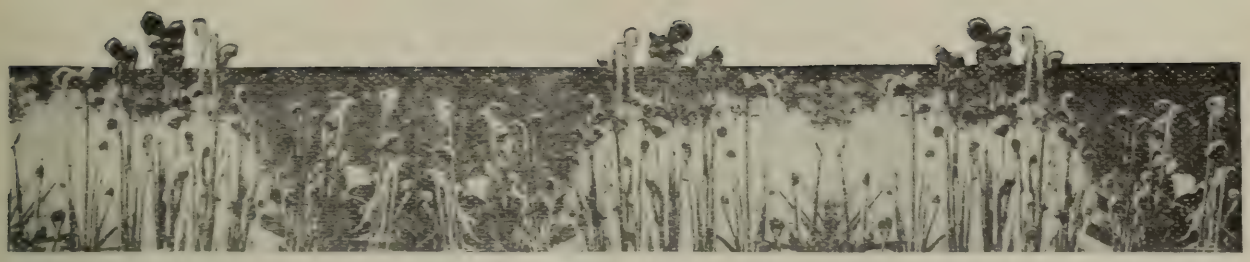
More especially the latter question is one of very grave import. Public international law is called by the French "Le droit des gens," while Americans and English speak of "The Law of Nations." As a matter of fact, it is only a law of *states*, and a consequence of this is that subjected nationalities, colonies and dependencies, native tribes and other subjugated and unhappy communities, which are not organized as independent states, have no other resort than that of arms and despair. There is no court in existence at which their claims may be lodged.

If there existed somewhere an institution of a quite independent character, outside any national combination, composed of men of the very first character, of high scientific standing and invested with commanding moral authority, the deficiency would be filled. To such an international—or, rather, perhaps, overnational—council controverted questions, which could not be laid before The Hague Court, might be referred, and tho the verdicts of this jury would of necessity be destitute of any but a purely moral sanction—no political or any other authority would be ready to execute them—it may be supposed that they would carry considerable weight.

It has been proposed that this great task should be undertaken by the Norwegian Nobel Institute. It will be seen at once that at present it is altogether unable to fulfill such duties, and I am not going to discuss whether the position of the Nobel Committee, as elected by a national legislature, will ever permit of this arrangement.

I only want to make this observation: An international council of this character must be composed of the very first lawyers and thinkers of the nations; they must be paid for their service on the council, so as to be totally independent of any other connection and elevated above every suspicion of partiality or bias of any kind.

But this implies enormous expense, so large sums that only in a very distant future—if at all—will the Institute be able to undertake this task.



There are movements the objects of which are to make the movements themselves superfluous — temperance and other abolitionist movements. It is a nice question whether the peace movement does not partake of the same character. And then, when the goal has been reached, the victory won, when the *Te Deum* of eternal peace has been sung in the temples of the millennium, what then of the Norwegian Nobel Institute?

Perhaps this question may be safely referred for answer to the eventual singers of the *Te Deum*. Of course, no sincere believer in the lofty ideal of international justice and good will is going to deny the possibility of such a future. But he will rather think of the immense quantities of work lying immediately before him; he will give up the idle dreams and take for his watchword the immortal lines of Longfellow, in his "Psalm of Life":

> "Let us, then, be up and doing,
> With a heart for any fate;
> Still achieving, still pursuing,
> Learn to labor and to wait."

This should be the watchword, too, of the Norwegian Nobel Institute.

CHRISTIANIA, NORWAY.

My Orchard in May

BY E. P. POWELL

Author of "Our Heredity from God," "The Country Home," Etc.

ALL the world loves an orchard, but the probabilities are ten to one that you have not seen one-half and have heard less of what is going on among your apple trees. Come and lie down with me on the May turf and let your senses have free play. Keep quiet and forget yourself. The orchard oriole in sunset colors, the scarlet tanager, the yellowhammer and the bluebird are all building, in ways as various as their colors. What economy catches your eye! Not one of these proposes a building that will cost him more than it is worth, but simply a summer residence for definite use. One new house each year, without any old traditions or accumulated bacteria! Why is this not rational? It does not exclude beauty any more than utility. It involves the finest art and the least possible waste of material and labor. Wagner's simple living is right here in this orchard, in these nested homesteads. There is no bric-a-brac to torment the Thoreaus, altho a few of the birds adorn their nests with free lichens and abundant mosses. We can do just this thing ourselves, in a human economic way, when we learn to migrate with the birds, and have our Southern as well as Northern homes.

All this your eye catches at a glance —scarlet and blue flitting the leaf-loved branches thru; your ears meanwhile are full of the music, not only of birds, but of ten thousand happy bees. The oriole has a shuttle song that weaves in and out among the flower clusters; but the music of the bees one must listen for, and when you get it, it is the music of labor, the joy of doing, the delight of accomplishing—the sweetest music in the world. A rain scud, not much bigger than your barn roof, comes out of the southwest, and drives a gust thru the trees. The bees start pellmell for their homes. They rise just above the shrubbery, dodging the larger trees, and go as straight as a bee line hiveward. For a few minutes the rush is like a river and the buzz incessant. You never noted it before; no, and before we leave you will find that there are many more things in the orchard, very common ones, that you have overlooked. I think these bees are making a frolic of it, to see which shall get under shelter and put away his load quickest. I am sure that insects have a great deal of fun. The flies have games of tag, and the ants hold their holidays. The bees are a busy people, but they have their merry moods —and also their cross ones. They like to chase a bad-smelling fellow away from near their hives. The shower is over almost as quickly as it came, and it leaves only a dew on the foliage. Some of the bees are already returning.

A catbird is watching us from that Harvest Bough tree. He is not quite sure of us, as we lie on our backs. He knows us best on our feet. His nest is being built in that thick cluster of limbs where the trimmer's art is needed. Evidently satisfied, he begins one of his superb trills. Now is your chance! Shut your eyes and let that music take possession of the whole world for you—to the exclusion of even observation. But if you will whistle back to him, he will soon learn your good will, pick up your notes, fill them with a purer melody and fling them back to you. An oriole

is like a golden shuttle in the foliage of the trees, but he is the incarnation of mischief. That is just the word for it. If there is any possible thing to be destroyed the oriole likes to tear it up. He wastes a lot of strings in building his nest. He is pulling off apple blossoms now, possibly eating a few petals. By and by he will pick holes in bushels of grapes, and in plum season he will let the wasps and hornets into the heart of every Golden Abundance plum on your favorite tree. If nothing better offers, he will pick openings into a half-bushel of your sweet apples. Yet the saucy scamp is so beautiful that he is tolerated —and he does kill an enormous lot of insects. There is a swinging nest just over there above the blackberry bushes on the Kirkland apple tree. It is wonderfully woven, and is a cradle as well as a house. I should like to have been brought up in as beautiful a homestead. The scarlet tanager I like better, only that he is a little fickle as to his home keeping; sometimes building two or three houses before he is mindful to bring up his family. Whether he gets suspicious, or what is the matter, I cannot tell. At any rate, no one shall disturb him in my orchard. The bluebird is a bit of the morning, and his call is so clear and pure that I would like to have him always for near company. It is rather pleasant to have a few holes in your old apple trees for the bluebirds to spy out and take for summer residences. They are very neat and tidy in their work—unlike the sparrow.

A moment's intermission of song calls your attention, and this is followed by simultaneous shouting of angry voices. Every bird in the orchard is excited and your bluebird is alarmed. Lie perfectly still and you will soon discover the trouble. A red squirrel, from the corn crib of Neighbor North, has crossed the street and the lawn, and is working his way, by jumps, thru the English elm. He sits for a moment in full sight, evidently speculating as to the economic advantages ahead of him. He is a beautiful fellow, but a rogue from the word "go." The birds fear him and they hate him. They will unite to fight him. It is only fair that we shall drive out the marauder and restore peace. Every red squirrel is promptly disposed of who ventures into this orchard of mine and the birds. A gray squirrel is a different fellow, and I have no score against him.

Higher up in the air there is still another field of activity and a very wonderful one. This is the hour when crows are still going back southward from their night's roosting place. They never sleep about their homesteads. By ones up to tens, they are cawing across the sky, high over the orchard. Some of them have evidently found a hawk about their nestlings, and they are chasing him with shrieks of wrath. He cuts great circles in the air that reach from the maple grove over the orchard, knowing that the crows, with their direct flight, cannot follow him. It is a curious trick, and their baffled efforts to strike him make a very complex maze, yet once and a while a crow gets a dab at the marauder which looks like an effective blow. A king bird, seeing the free fight, darts from somewhere in the bee yard, and now look out! He is in at the hawk's eyes in a trice, and the scamp begins to work his diagrams off over the valley in great haste. It is rather a pretty sight to see pluck whipping a loafer. One after another the crows move backward to repair damages among their nests.

Apple blossoms are far from being all pink, as the common description has it. Pink is rather rare in the orchard, and some trees are literally white, while others are very nearly crimson. It will teach careful observation to note that the Rhode Island Greening gives us almost a white flower, while the McIntosh gives us a much deeper color, and the Pound Sweet gives us a lovely blending of shades that is hardly surpassed in the orchard. Why not take scions from that deep-red-flowered seedling and graft into a grove for the lawn? So common are apple orchards that we forget that nothing in this world is for beauty comparable to an apple tree in full bloom. Nature has not attempted anything else so fine, so profuse, so delicately sweet, so wholesome with ozone. It was after she had done this that she said, "Behold, for simplicity and sweetness I can do nothing better; so the apple blossom shall become the apple, and men shall be led to worship God in Nature." Man

has taken the gift, but he has forgotten the worship. He prefers a psalm to the unseen gods that create worlds, but who have nothing to do with apple blossoms and baskets of apples.

I do not know of any other tree with which one may form a friendship so well as with the apple. I love the knots, and even the bruises of the old Sweet Bough, that used to drop apples of mornings on the roof over my bed. I never doubted but they were intended for me—great white apples with blushed cheeks, and they split open as they fell, and the seeds lay in a spoonful of honeyed juice. I wonder how those apples would taste now. But there is a fashion in apples, and just now nobody grafts the Sweet Bough. It may break its heart on some rock in the orchard corner, but it no longer calls little boys up in the morning, while leaning lovingly over the porch. The popular apples today are the Summer Rose and the Summer Queen and the Red Astrachan, and many another apple which, for delicious heartiness, cannot be compared with our old favorite.

I saw an old man one May day, over in the glen, leaning on his staff, and looking about him with a dazed memory. I asked him what he sought, and he said: "I have come back here after half a century in a Western State, and I cannot find one of my old companions—not one—and I thought maybe up here I could find the old apple tree where I sat and studied when a schoolboy. But things have grown and things have died, and I don't know where I am." I helped him identify his old friend, and then he put his arms around the tree and cried. I left them together. For my part, I deeply sympathise with the old man, for I myself should not have lived half my days had the life cord been severed that bound me to my boyhood home and the old friends. A leaning apple tree should be in every orchard—leaning so that incipient boys and girls may easily climb up into the boughs—and with slates do lessons, or with needles do stunts, at the same time learning to see accurately and to hear precisely—for is not that the best part of education? My leaning apple tree had a perfect seat, and there, half a hundred years ago, I sat and dreamed out most that I have since realized.

In the tops of the trees overhead a deft hand has set grafts of Spitzenberg, and in others the Rhode Island Greening and the Baldwin, but mostly the deep crimson Spitzenberg dominates. So there is everywhere thru the orchard, on top of the older life, a new life with new thoughts. It is a curious sight, for some of the limbs are waving, while others are stout and erect. I think it is the older sorts that mostly are yielding and the newer sorts that are stiff and stately; and when the blossoms are apples and the apples ripen, there will be red or yellow fruit spread all over the green or striped ones. The roof of the orchard in picking time is glorious with its crimson and scarlet. Wonderfully as Nature works alone, she never forgets to invite our co-operation, and man's art is not much worth the while unless he is co-operating with Nature. This neat science of breeding new fruits by grafting is one of the prettiest performances of human hand and brain. If you have not learned how it is done, I advise you to visit the orchard in April, and you shall put in a few scions for yourself. Then, after two years, you shall come and find how the wood that you inserted has become a part of the tree, bearing its own sort of fruit instead of that on which it is grafted. The juices below, when they touch your scions, wholly change their characteristics. This is the crowning glory of horticultural art. It is not easy to forget the father who taught me to graft when I was but a lad, and then to put choice varieties into wild trees by the forest edge, "for the birds, my boy; they like cherries, and why should we not help them to the best?" It was a gentle and a thoughtful work, and so between us we grafted those huge apple trees, and taught them no longer to waste their power on inferior stock, instead giving us the best of the Pippins golden and the Pearmains red.

All this while we have been lying on a couch quite as delightful as any that art could furnish. Did you ever study the vegetation that you can reach on a square yard? At any rate, before we leave the orchard, you had better see what you have within hands' reach.

Here is a sprig of yarrow and another of buttercup; three varieties of clover and a bit of sweet clover beside; a thistle from Germany—the Hessians brought them here; a daisy, that started somewhere in Asia; blue violets and one little, blushing, half white cousin; plum shoots from Persia, and a quince from Africa; moneywort from I know not where—and a pest of the worst order. Now you may count on for yourself, and you will find that you have not less than thirty or forty grasses, weeds, flowers and suckling trees. This is always a marvel to a novice; it is Nature's nursery, where she has her stock always in abundance and ready to be transplanted, and they have been collected here from half the countries of the world. One need not travel far to see a great deal of the world's vegetation. So, you see, if one wishes to enter into close relations with Nature he cannot do it without opening his eyes. The one thing that the schools most need is to teach the use of the eyes and ears. We are too restless telling what little we do know and losing very much that we ought to know.

This is my orchard in May; full of beauty, activity, life, thoughts, homes and promises. All summer and every day it will be the center of a homeful life. Taking it altogether, you will find that it is arranged with artistic regard to color and sound; it is Nature's cathedral. You will need, however, no fluted organ nor painted windows, for Nature does not use her sounds or colors under such restraints. There are creeping winds that make music close to the sod, there are high breezes that play with the growing leaves, and others that roll clouds across the upper sky. There is at least a full octave between the sod and the skies. But for color the orchard is altogether russety and quiet—homeful colors. The place for a house is in the middle of an orchard. Brighter colors you will find among the maples and oaks on the lawns; here all is restful.

CLINTON, N. Y.

The Lesson of the "Connecticut's" Grounding

BY PARK BENJAMIN

ON the afternoon of January 13th last, the day being bright and the sea smooth, the United States battleship "Connecticut," one of the newest and largest vessels of her class, ran upon a shoal in the vicinity of Culebra, Porto Rico. The locality had been the drill ground of the Atlantic fleet for many years. The shoal was perfectly well known and had appeared on all the charts for centuries. There was nothing difficult or dangerous in the channel to be traversed, and no obstructions which the ordinary use of every-day methods of navigation could not easily have avoided.

Nearly two months afterward the commanding officer was tried by court-martial for "thru inattention and negligence suffering a vessel of the navy to be run upon a shoal" and for "neglect of duty." He was convicted and the sentence imposed, after reduction by the reviewing authority in view of the court's recommendation to clemency, was nine months' suspension and loss of three numbers in his grade. This delays the seniority promotion of the officer to rear-admiral for several months, puts three lifelong juniors over his head, and fines him about eighteen hundred dollars.

The Navy Department, as usual, suppressed the details of the event, and the *Army and Navy Journal* was thereupon moved to say that "apparently nothing is known or will be known as to the testimony on the trial." The new naval periodical, *The Navy,* has nevertheless, with commendable enterprise, obtained and published all the material facts elicited.

In the bright glare of the tropical sun a red channel buoy was mistaken for a black one, and a course not having been laid which would have cleared the shoal beyond peradventure, the orders given, based on the misapprehension, sent the vessel upon the danger instead of away from it. In brief, precautions which would have prevented the accident were not taken.

The members of the court-martial were eight admirals and one captain, all of whom will have reached the age limit and be retired inside of the next thirty months. Their combined ages now aggregate five centuries and a half. They were all midshipmen with the accused—all cognizant of every detail of his past career.

The inculpated officer was near the top of the list of captains, would have reached flag rank next fall, and his long service period of forty-four years had hitherto been without blemish. He was noted for soundness of judgment, and the Navy Department had often depended upon it in determining matters involving large expenditures. He had also for some time been a member of the General Board, the function of which is to advise the Secretary in questions of naval policy, and in this highly responsible position he had exercised much influence. His fault lay not in judgment, knowledge or intent, but in omission. This, in the opinion of the court, shown by the severe penalty inflicted, did not detract from its gravity, nor, in the opinion of the Navy Department, did it in anywise discharge the accused of his responsibility for the safety of his ship.

The affair has been treated, and the indications are that the Navy Department would like to have it treated (if not altogether hushed up) as a normal incident of sea peril closed by the infliction of "adequate" disciplinary punishment. It is a great deal more than that. It is an object lesson of singular importance.

For many years there has been a steady diminution in the proportionate time our naval captains have been afloat. Thirty years ago the officers of that grade had put in an average of 63 per cent. of their total naval service at sea. Now their sea experience amounts to but 50 per cent., and this altho their total average professional lifetime has increased from about thirty-two to forty years. Hence among the battleship commanders the proportion of sea experience has decreased while their age has augmented. The sea experience of the captain of the "Connecticut" fell far below the average. It was in all about eighteen years. That is of his total career 40 per cent. of it had been at sea, as against 47 per cent. on shore duty and 13 per cent. unemployed.

During the 47 per cent. shore stay he had been doing about every kind of work except that of a sea officer. He had even distinguished himself as a mechanical engineer in quasi-private employment. He had attended to the designing of storehouses and magazines; and, more recently, matters of grand strategy had more particularly claimed his attention.

His sea service had been in large proportion—in fact, wholly up to his thirtieth year—on vessels now not only obsolete, but in all their appurtenances practically archaic. On two fairly modern ships he had served in the highest subordinate position, which happens to be one to which no responsibility for the navigation of the vessel attaches. At about the age of fifty he attained his first command—that of a gunboat of 1,700 tons. Thence he proceeded via an armchair at the General Board to the control of a great floating fortress of 16,000 tons. From the easy burden of a little ship costing less than half a million he passed to the tremendous responsibilities of one costing over seven millions. And between these two vessels there is more difference than between the first and Paul Jones's "Bonhomme Richard" of 1778.

This is an illuminating instance of the way in which we have been producing captains. It is typical of the dangerous system which prevails and which never, in the whole history of the Navy, has borne more perfect fruit. Unspotted reputation, recognized attainments, long and faithful service all achieved, but the thing needed most of all not got. Experience garnered, of course, but not the experience of the kind which insures the

safety of ships and the safety of the people who provide them; experience in shops and factories and offices, but not the sea experience which alone makes the competent seaman. It was the system which put this officer with the sort of experience he had been permitted to attain on the bridge of the "Connecticut" at fifty-nine years of age, and it was to the system that he fell a victim. And there was not a man on the court which condemned him who did not know it, who did not know that he himself had escaped a like fate in the past only thru good fortune, who did not know that the same peril confronts today every captain in the Navy, and who did not know that in that sentence he condemned the captain of the "Connecticut" only as a vicarious sacrifice, and in reality blazoned to the whole country the gross neglect of the Congress of the United States.

To that neglect is due the system which still keeps men in subordinate place until all capacity for initiative and for responsibility is killed out of them. Most of the present captains were lieutenants for approximately twenty years. The system converts human beings different in their capabilities into mere automata, mechanically moving up from grade to grade and finally to positions where the issue of peace or war may be in their hands, and this whether they are really fit or not. It has even attacked them at the fountain head and changed their school from a place where boys were taught first of all what duty means and then the educational essentials within the grasp of immature minds to a huge forcing house which in the intervals between athletic contests ejects them in the throes of intellectual indigestion. With egregious folly it exalts the transformation of the military sailor into the "fighting engineer," and subordinates the seaman to the gunnery expert, or the motive power expert or the electrical expert—useful enough and necessary in their fields—forgetting that so long as ships are ships, sailors must be sailors, that ship and sailor are natural complements not to be divorced, and that in the last analysis the safety and efficiency of the ship must depend not on the protean abilities of some nautical jack of all trades, or on those of some specialist, however accomplished in another pursuit, but on the trained skill and certain touch of a commander still in the plenitude of his mental and physical powers, and bred for the sea, *on the sea.*

The Navy Department is torpidly alive to all this, but seemingly helpless. When it ordered a former professor of rhetoric and literature of fourteen years' standing to the command of a battleship, which he promptly ran into the mud at Hampton Roads, it excused itself by explaining that Congress made him, along with the other captains, and his turn for sea duty having arrived, he had to be utilized. All it seems able to do is to provide object lessons—when they do not provide themselves, as in the case just noted and now in that of the "Connecticut."

For example, it has kept for some years past an officer retired for age in the most important of all administrative positions and has lately announced that his successor will also be taken from among the legally superannuated. Yet the list of active officers is full. Are none of them competent for the place? It is reported that the superintendency of the Naval Academy—soon to be vacant and where, if anywhere, there is needed an officer young, vigorous and in the full practice of his profession—is to be bestowed on a venerable admiral, years since retired to a rural retreat, where it might be supposed a long and well-spent career would entitle him to be left in peace. There are about twenty-six rear-admirals on the active list—eight "extra numbers" above the quota allowed by law—and yet Rear-Admiral Evans, having completed a full tour of duty in command of the Asiatic Squadron, was immediately started on another one in command of the Atlantic Fleet. And he holds that yet, despite the urgent need of giving somebody else besides him a chance to be educated in fleet command. Is the Navy Department afraid to relieve him?

A remedy for the existing system was devised last winter by a commission of naval officers acting under the Department, and was embodied in the so-called Personnel Bill. It was approved by the President, made the subject of one of his special Messages, and laid before the

House on December 17th. The line officers of the Navy actively supported it. Senator Hale indulged in his favorite obstruction, and the chairman of the House Committee gazed at it ruminatively, and could not find time to do anything. Then the unending line-and-staff fight began again, and the gentlemen who construct wharves and keep books and cure ills, but who find life not worth living *sans* military names ("Piledriver Admirals, Bookkeeper Admirals and Accoucheur Admirals," as one disgruntled marine warrior who smelt powder with Farragut and Porter irreverently called them the other day) blocked the way until the doubts about their "Titles" could be settled.

So the system stays without palliation unless the President shall conclude that he has authority, temporarily at least, to send the youngsters of twenty-five years' standing and thereabouts, who have been brought up in steel vessels and not wooden ones, to the command of battleships and squadrons. Meanwhile we have assembled at Jamestown the greatest gathering of modern ships and antique commanders that we have ever collected: Typical alliances of the May and December variety. People who look at them may conveniently recall that since we started to reconstruct the navy in 1883 that arm of the public service has cost one billion one hundred and forty-five million dollars, and that the sixteen battleships and the aged admirals and captains are the flower of that expenditure. What inefficient commanders may cost us we shall discover as episodes like that of the "Connecticut" and "Rhode Island" multiply, but not completely until after hostilities begin. The present expense of running the navy is nearly a hundred millions per year, and it is increasing. The yearly cost of maintenance of a battleship would now handsomely endow six professorships, and before long will reach a round million. We are paying all this money for naval purposes, including the construction of vessels that become obsolete in a very few years, some think as an insurance premium against war, others as a liquidation of our share in one phase of contemporary ignorance as to duty to one's neighbor. However we may differ as to this, no one disputes that having paid for something we ought to get it. One of the things we have paid for and don't get is efficiency and skill in our naval commanders equal to the best anywhere. It is not their fault, but that of the system. The responsibility for not ending that system, which could have been done in a week last session, directly belongs to Senator Eugene Hale and Congressman George E. Foss and their committees in Congress. They won't do it until they are made to. It is for us, and more especially their particular constituents, to make them.

The Jamestown naval pageant is sure to arouse a lively patriotic sentiment. This can be turned to no better purpose for the general good than forcing the swift passage of the Naval Personnel Bill when Congress meets, thru persistent unrelenting censure and prodding of Messrs. Hale, Foss and their associates during the coming summer.

Shakespeare's Spelling

BY GEORGE McLANE WOOD

[In view of the anniversary of the founding of the Simplified Spelling Board, which was celebrated in New York recently, and the announcement of the Board of plans for broadening its work, the following article should be of interest.—EDITOR.]

SOME of the published comments on President Roosevelt's order requiring the use of "simplified spelling" in Government publications reveal an amazing degree of ignorance concerning the history of English spelling. Several criticisms of the new spelling printed in London newspapers contain pompous references to "the language of Shakespeare." One English story writer says (if the press dispatches report him correctly): "The language as written by the translators of the Bible and by Shakespeare is good enough—indeed, too good—for me." Even one American critic, the president of a Western university, echoing, in somewhat different tone, these English cries of alarm, says: "Any radical change, such as, for instance, would be involved in phonetic writing, would have the effect of cutting us off from the language of Shakespeare and the English Bible, making of this a semi-foreign idiom to be acquired by special study."

The phrase "the language of Shakespeare," as used by these English writers in this connection, can be interpreted only to mean that the *spelling* of Shakespeare was not the "simplified" spelling of Roosevelt, but the present spelling of the London *Times*. This inevitable interpretation makes the sounding sentences containing the phrase simply preposterous—as preposterous as most of the other printed criticisms of "simplified spelling." Of course nobody knows exactly how Shakespeare did spell the words he used in his plays, for the only specimens of his handwriting that have come down to us are a few signatures, variously spelled, in grotesque and almost illegible characters. The diverse spellings of the poet's name — Shakespere, Shakspere, Shakspeare, Shakespear, etc.—have been derived from these diversely spelled signatures. Obviously, a man who did not care how he spelled his own name would not be likely to care much how he spelled other words, particularly as it was not in his time important that the same word should always be spelled in the same way.

We do know very definitely how some of the first printers of the plays spelled the words they contain. The first collected edition of Shakespeare's works was published seven years after his death, in what is now called "the First Folio," or "the Folio of 1623." The text was nominally edited by John Heminge and Henry Condell, two of Shakespeare's fellow actors, and the volume included, among other preliminary matter, a versified introduction by Ben Johnson. The printers were Jaggard and Blount, and the spelling was in the fashion of that time. The "booke" was full of errors of various kinds, but nevertheless has been called, not without reason, "the greatest contribution made in a single volume to the secular literature of any age or country." This edition of the folio, which is "the fountain head of knowledge of Shakespeare's complete achievement," and also earlier editions of sixteen single plays printed separately during Shakespeare's lifetime have been reproduced in photographic facsimile, and these reproductions are available for examination in many libraries. A little study of these facsimile reprints might be illuminating to some of the critics of "simplified spelling" who find their text in the phrase "the language of Shakespeare."

In the first folio—in which the plays were "truely set forth according to their first originall"—and in the earlier editions of single plays printed while Shakespeare was living we may find the "simplified" spellings *blusht, clapt, crost, curst, dropt, exprest, fixt, husht, impresst, increast, kist, lasht, lopt, mist, past, skipt, slipt, stopt, stript, tript, vext, watcht, wisht,* as well as *kild, mard, sufferd,* and

other similar forms. Falstaff says ("Merry Wives," V, 1, First Folio):

"I am in hast; go along with mee; Ile tell you all, Master Broome [Brooke], since I pluckt Geese, plaide Trewant, and whipt Top I knew not what 'twas to be beaten till lately."

Shakespeare's first printers evidently made attempts to spell at least some of the words of the plays truly—that is, to represent the sounds of the words as they were uttered—rather than to conform, as we do, to arbitrary conventional modes of spelling them; but as there were then, as now, no general definite rules for spelling, and as many of the letters of the Roman alphabet then, as now, had no certain English values or sounds, the results of these attempts varied from page to page, or even on the same page. In the folio we find *go* and *goe, me* and *mee, wil* and *will, els* and *else, hart* and *heart, pitty* and *pittie, pesant* and *pezant, perill* and *perrill, ducat* and *ducket, curfewe* and *curphew, publikely* and *publiquely; choice, choise* and *choyse; seize, ceize* and *seaze; mongrill, mungrel* and *mungrell; here, heere, hier* and *hyer; adieu, adew, adiew* and *adue.* We find such short forms as *rime, yern, tong, tuch, skil, shal, brest, wel, dwel, gon, thred, honor, beter,* as well as such long forms as *sinne, roague, summe, battaile, lunatique, sheepeheard, musicke, frollicke, sawcinesse, flegmaticke, schollerly. Oke* looks odd to us for oak, *ayre* for air, *sonne* for sun, *cosen* for cousin, *forreyner* for foreigner, and *worthlesse guifts,* an *antike* Roman, and even *stewd prewyns* are strange to our eyes. Queer-looking phrases like *sodaine surprize* and *comfortlesse dispaire* look stranger still when they are reprinted literally, in facsimile, with the "long s," as "ſodaine furprize" and "comfortleſſe diſpaire."

In these earliest editions of Shakespeare's works even the names of some of the plays and of some of the characters in them are not spelled in modern ways. There is "'Much Adoe' [First Folio; 'Adoo' in the 'Catalogue' or table of contents] About Nothing," and there is "The Tragicall Hiſtorie of Hamlet, Prince of Denmarke" (Quarto of 1603), in which "Ofelia" (IV, 5) speaks of a "dazie" and a "panſey." In the opening scene of "A Midſommer Nightes Dreame" (Quarto of 1600), Theseus says to Hippolyta:

"Now faire Hippolita, our nuptiall hower
Draws on apaſe; fower happy daies bring in
Another Moone."

Antipholus of Syracuse ("Comedy of Errors," II, 2; First Folio) says:

"To mee ſhe ſpeakes; ſhee moues mee for her theame."

Portia ("Merchant of Venice," II, 1; First Folio) says:

"In tearmes of choiſe I am not ſolie led
By nice direction of a maiden's eies;
Beſides, the lottrie of my deſtenie
Bars me the right of voluntarie chooſing."

Polonius, in his advice to his son, Laertes ("Hamlet," I, 3; First Folio), says:

"The friends thou haſt and their adoption tride,
Grapple them to thy Soule with hoopes of Steele."

Hamlet, in the soliloquy (III, 1; First Folio), says:

"to dye, to ſleepe—
No more; and by a ſleepe to say we end
The Heart-ake and the thouſand Naturall ſhockes
That Fleſh is heyre too."

In the "Two Gentlemen of Verona" Valentine speaks of "penitentiall grones . . . . and hart-fore sighes," and Sylvia says, "I gheſſe the ſequell." In the "Merry Wives" Falstaff says, "I profeſſe requitall to a haire's bredth," and Pistol declares that "Yong Rauens muſt haue foode," the five words of which sentence are all different from the current printed forms for the same words.

Any one who should go to the first printed editions of Shakespeare's plays for material to disparage "simplified spelling" would find himself, as Falstaff puts it ("Merry Wives," IV, 5; First Folio) "as creſt-falne as a dride peare."

The first printed edition of the "Sonnets," published in 1609, exhibits the same sort of Shakespearean spelling. In it we may find such spellings as *nurrifht, opreſt, miſplaſt, reherſe, welth, hunny, fewell, culler, coppy, cryttick,* and hundreds of other forms not found in Doctor Johnson's Dictionary.

All talk about being "cut off" from the language of Shakespeare by a new spelling or by a return to Shakespearean spelling is manifestly absurd. The changes in English that tend and are constantly tending to make the language

of Shakespeare "a semi-foreign idiom" are not changes in spelling; they are those changes that now make a glossary (whether incorporated in footnotes or printed in other form) an indispensable part of any complete edition of the plays. Considered in detail, the language of Chaucer is not the language of Shakespeare, the language of Shakespeare is not the language of Tennyson or of Browning. All living languages are subject to change; the rules of syntax change, pronunciation changes, words and phrases become obsolete, new words and phrases are introduced, words lose old meanings and acquire new ones. When Hamlet says, "I'll make a ghost of him that lets me" he means "hinders me," in modern parlance. But changes like these in English—even changes in pronunciation, unfortunately—have had, since Shakespeare's time, no relation to spelling. Strictly speaking, the spelling is only a means of representing the language. Hamlet's soliloquy is in the same language (if it is the same soliloquy), whether it is written in the spelling of Shakespeare's first printers, in the respelled English of a modern edition, or in Pitman's phonetic shorthand. The playgoer will hear the same words, the same English, from Shylock and from Portia, whether the players learn their parts from a text printed or written in one or another of these forms.

In addition to being edited and revised and amended and corrected in every conceivable way, as well as expurgated, Shakespeare's plays have been respelled from time to time as English has been respelled, and the very fact that English has been respelled from time to time makes it seem at least possible that it may be again respelled; yet none of the newer spellings need in any way injure or impair the language of Shakespeare. Indeed, no one can reasonably doubt that Shakespeare's language may be more truly represented by a better spelling than is now conventional, and it is very probable that most of the so-called new spellings proposed by the Simplified Spelling Board were among those used by the poet himself; certainly they were current in his time.

WASHINGTON, D. C.

Another Constitutional Amendment Necessary

BY JULIUS C. BURROWS

UNITED STATES SENATOR FROM MICHIGAN.

THE recent investigation in connection with the Senatorship for the State of Utah revealed a condition that startled the country and challenges the serious consideration of the National Government. When, in 1896, Utah was admitted into the Union as a State, it was supposed that precaution was taken to adequately guard against the continued domination of the Mormon Church and its practice of polygamy, which had marked the course of that organization from its first settlement in the Territory. To that end it was stipulated in the Enabling Act, and subsequently embodied in the Constitution under which Utah was admitted, that "There shall be no union of Church and State, nor shall any Church dominate the State or interfere with its functions." And that "Polygamous or plural marriages are forever prohibited."

When, on the 4th of January, 1903, the credentials of Reed Smoot were submitted to the Senate, there was presented at the same time a protest against his being permitted to take the oath of office as a Senator, for the reason that the conditions upon which Utah was granted Statehood had not been complied with, that the State had broken faith with the Government of the United States, that a union of Church and State had been established, that the Church continued to dominate the State and interfere with its functions, and finally, that the practice of polygamous or plural marriages still prevailed.

It was further charged that Joseph F. Smith, with his two counselors, constituting the First Presidency of the Church, together with the twelve so-called apostles, of which Reed Smoot was one, constituted the ruling authorities of such Church, and that such body continued the practice of political dictation and interference with the functions of the State, and inculcated and encouraged a belief in polygamy and polygamous cohabitation, and that Reed Smoot, by identifying himself with and becoming a part of such governing body, had disqualified himself for membership in the Senate of the United States.

Under that provision of the Constitution which authorizes each house to judge of the elections, returns and qualifications of its own members, the credentials of Mr. Smoot, together with the protest above mentioned, were referred to the Committee on Privileges and Elections, with instructions to examine into the charges made in the protest, and generally to inquire into the right and title of Reed Smoot to a seat in the Senate of the United States as a Senator from the State of Utah, and report its findings thereon. The inquiry, thoro and exhaustive, extended over a period of more than two years, and the result of such investigation is summarized in the report of the majority of the committee as follows:

"That Mr. Smoot is one of a self-perpetuating body of men known as the First Presidency and Twelve Apostles of the Church of Jesus Christ of Latter-Day Saints, commonly known as the Mormon Church; that these men claim divine authority to control the members of the Church in all things, temporal as well as spiritual; that this authority is, and has been, for several years past, so exercised by the said First Presidency and Twelve Apostles, as to encourage the practice of polygamy and polygamous cohabitation in the State of Utah and elsewhere, contrary to the constitution and laws of the State of Utah and the laws of the land; that the said First Presidency and Twelve Apostles do now and for a long time past have controlled the political affairs of the State of Utah, and have thus brought about in said State a practical union of Church and State, contrary to the constitution of the said State of Utah, and contrary to the Constitution of the United States, and that said Reed Smoot comes here, not as the accredited representative of the State of Utah in the Senate of the United States, but as the choice of the hierarchy which controls the Church and has usurped the functions of the State."

The report of the committee concluded by recommending the adoption of the following resolution:

"Resolved, That Reed Smoot is not entitled to a seat as a Senator of the United States from the State of Utah."

The action of the Senate in disagreeing to the recommendation of the committee puts an end to the controversy, so far as Senator Smoot is concerned, by confirming his right and title to a seat in the Senate of the United States as a Senator from the State of Utah.

But we are confronted by a question of far greater moment than the seating of Senator Smoot. The investigation discloses a condition of affairs in the State of Utah and adjacent States and Territories, in relation to the continued practice of polygamy and polygamous cohabitation, which must challenge the serious attention of the country, and demands some drastic measures for the suppression of these crimes. So far as these offenses exist in the Territories, the power of the general Government for their suppression is ample and complete. It is only necessary to enforce existing law to uproot and destroy the last vestige of these crimes in all the Territories of the United States; but to suppress the practice within the limits of a State is another and quite a different problem. Here the Federal Government is without jurisdiction. I take it, however, that it goes without saying, that if these crimes exist in any State, and the State authorities neglect or refuse to put a stop to their continuance the general government will find a way to put an end to a practice which, if persisted in and extended, will ultimately undermine the foundations of society and shake the whole fabric of civil government. The suppression of these crimes within the limits of a State is the vital question at issue.

That polygamy and polygamous cohabitation exist in the State of Utah and in States and Territories adjacent thereto is unquestioned. This practice constituted the cornerstone of the Utah Mormon faith from the time Brigham Young proclaimed the doctrine in 1847 until 1890, a period of forty-three years, and it is a matter of surprise that, in the face of the Manifesto of 1890, issued by the head of the Church, suspending the tak-

ing of plural wives, and in defiance of the inhibition in the Constitution under which Utah was admitted into the Union, the evidence shows conclusively that belief in polygamy and the practice of polygamous cohabitation is not only rampant in the State of Utah, but has spread into adjoining States and Territories, and is today alarmingly flagrant in several of the States and Territories of the Northwest.

As to the celebration of new plural marriages in Utah since the admission of the State, the evidence is exceedingly difficult to obtain, as such marriages are usually performed in secret, frequently beyond the jurisdiction of the State, sometimes on the high seas, and at other times in darkened rooms, with such environments as to make proof of the fact impossible. It is also in evidence that, when these marriages are performed in the temples, as they frequently are, a record is kept of such marriages, but altho process was issued for the purpose of securing these records, the mandate of the committee was disobeyed, and thus written proof of plural marriages suppressed, and it was therefore impossible to establish with any degree of certainty to what extent plural marriages have been performed since the Manifesto or since the admission of Utah as a State. It is in evidence, however, beyond all controversy, that members of the Church in highest authority, the apostles and others of less official prominence, have taken plural wives since the Manifesto prohibiting that practice. Abraham Cannon, George Teasdale, John W. Taylor, Matthias F. Cowley and Marriner W. Merrill, all apostles of the Mormon Church, have taken plural wives since the Manifesto, and some of them since Utah was admitted as a State, Abraham Cannon having taken a plural wife as late as 1896. It also appears from the evidence in the case that Charles E. Merrill, James Francis Johnson and Bishop Rathall, all Mormon bishops, have taken plural wives since the Manifesto, the ceremony being performed by an apostle of the Church.

It is also in evidence that James M. Tanner, superintendent of Church schools; Benjamin Cluff, Jr., president of Brigham Young University; Thomas Chamberlain, counselor of the president of a stake, have taken plural wives since the prohibition, while other adherents of the Church of lower official standing, in large numbers, have taken plural wives since the Manifesto, and some of them even since the admission of the State, and as late as 1902. These instances, proven beyond all controversy, are sufficient to establish the fact that plural marriages are being performed in Utah and have been ever since her admission as a State.

As to the practice of polygamous cohabitation, the evidence is overwhelming and conclusive. Joseph F. Smith, the head of the Church, testified before the committee that he was living in polygamous cohabitation with five different women, and that that fact was known to everybody thruout all Utah, and that he proposed to continue that relation regardless of any law prohibiting the same, human or divine; and the following apostles, George Teasdale, John W. Taylor, John Henry Smith, Marriner W. Merrill, Heber J. Grant, Matthias F. Cowley, Charles W. Penrose and Francis M. Lyman, were proven to sustain polygamous relations with a multiplicity of wives, while Brigham H. Roberts, one of the presidents of seventies; J. M. Tanner, superintendent of Church schools; Andrew Jenson, assistant historian of the Church; Thomas H. Merrill, a bishop of the Church; Alma Merrill, a president of a stake; Angus M. Cannon, patriarch; Greenwald, the head of Church schools; George Reynolds, one of the first seven presidents of seventies and first assistant superintendent of Sunday schools of the world; George H. Brimhall, president of the Brigham Young University; Joseph Hickman, teacher in the university, all these were shown to be living in polygamous cohabitation. These are but a few of the many established cases of the leading authorities of the Mormon Church living in undisputed and unconcealed polygamous cohabitation.

To sum the matter up, it is stated that fully 12,000 members of the Utah branch of the Mormon Church, or 23 per cent. of the whole number, are living in polygamous cohabitation.

Not only does this crime exist in Utah

and adjacent States, but has spread into several of the territories, and is continued there in open defiance of law.

The records of the Attorney General's office show that in the year 1905 there were in the territory of Arizona sixteen convictions under the Edmonds law, and of this number twelve were for unlawful cohabitation, and during the same year, there were in the territories of Arizona and New Mexico thirty-one convictions, a majority of these being for polygamous cohabitation. It is conclusively established, therefore, that not only polygamy, but polygamous cohabitation exists today in Utah, and in other States and Territories, and it only remains to inquire how is this crime to be suppressed?

It is manifest from the evidence taken by the Committee on Privileges and Elections that not only does polygamy and polygamous cohabitation exist in the State of Utah, but that it is the deliberate purpose of those who persist in the practice, to continue to do so regardless of all law, human or divine. As the head of the Church, Joseph F. Smith, stated before the committee that he not only believed in polygamy as an abstract principle, but that he was living in polygamy openly, and that it was none of the business of the United States, saying:

"It is not the law of Congress under which I am living and by which I am punishable. The law of my State and the courts of my State have competent jurisdiction to deal with me in my offences of the law, and the Congress of the United States has no business with my private conduct any more than it has with the private conduct of any citizen of Utah or any other State. It is the law of the State to which I am amenable."

Ex-Senator Edmonds adds force and pungency to this contention when he says:

"The evidence so far obtained by the Senate committee investigating the case of Senator Smoot includes a list of the chief rulers of the Mormon Church who have deliberately and continually carried on the practice of polygamy without prosecution or annoyance in the face of their pledges made to two Presidents of the United States, and have set an example, naturally, and almost necessarily to be followed by their Church members and adherents, without any danger of interference by the Legislature or any other department of the Government by the State of Utah. They know that Congress has no power, and that the State has no disposition to interfere."

But, the practical question now before the American people is, How can polygamy and polygamous cohabitation be uprooted in Utah and other States where it exists today? So long as Utah had a territorial form of government, it was competent for the Federal Government to legislate directly touching these offences. This it did by the Act of 1862, and the Acts supplemental thereto of 1882 and 1887, which, could they have been continued and enforced, by keeping Utah a territory, the last vestige of this crime would have long since been uprooted and destroyed. It was a blunder bordering on a crime to have admitted Utah as a State before this practice was completely destroyed, for, the moment statehood was accorded, that moment the power of the General Government over the matter ceased, and the revival of the practice of polygamy, as Senator Edmunds well said,

"should surprise nobody except those whose generous and confiding faith in promises led them to believe that the settled polity of a great and powerful Church would be, or remain, reversed when that organization should become independent of the only power it had any reason to fear."

The practical question, therefore, is, How can this crime be eradicated from Utah and other States where it has gained a foothold and threatens continued domination? There is no possible way of reaching this crime and eradicating it now, except by an amendment to the Federal Constitution, giving the National Government jurisdiction to deal with the matter. It was only by an amendment to the Constitution that we were enabled to completely and permanently abolish slavery in the States. I confidently believe that, as in the case of slavery, this "twin relic of barbarism" will, in the not distant future, be destroyed, not in the bloody throes of war, but thru the peaceful yet equally effective instrumentality of an amendment to the national Constitution, declaring that:

"Neither polygamy nor polygamous cohabitation shall exist within the United States or any place subject to their jurisdiction."

This, in my judgment, is the only method now open by which the continuance and spread of this barbarous practice can be arrested and placed in course of ultimate extinction.

In 1856, the first National Republican

Convention, assembled at Philadelphia, declared, among other things, that:

"The Constitution confers upon Congress sovereign power over the Territories of the United States for their government, and that in the exercise of this power it is both the right and the duty of Congress to prohibit in the Territories those twin relics of barbarism, polygamy and slavery."

On the 1st day of January, 1863, during the progress of the Civil War, Abraham Lincoln, by virtue of the power vested in him as Commander-in-Chief of the Army and Navy of the United States, issued a proclamation declaring "That all persons held as slaves [within certain designated States] are and henceforth shall be free." Subsequently, and in 1865, this proclamation was crystalized into an amendment to the Constitution of the United States, declaring that:

"Neither slavery nor involuntary servitude (except as a punishment for crime, whereof the party shall have been duly convicted) shall exist within the United States, or any place subject to their jurisdiction."

Thus, in less than ten years after the declaration of 1856, slavery, which antedated the Constitution and was interwoven with every fiber of the national life, was not only prohibited in the Territories, but entirely abolished and utterly destroyed thruout the United States. Thus perished one of the "twin relics of barbarism," while the other still survives to shame the State and vex the nation.

The President of the United States, in his last annual message, said:

"I am well aware of how difficult it is to pass a constitutional amendment. Nevertheless, in my judgment, the whole question of marriage and divorce should be relegated to the authority of the National Congress. At present, the wide differences in the laws of the different States on this subject result in scandals and abuses; and surely there is nothing so vitally essential to the welfare of the nation, nothing around which the nation should so bend itself to throw every safeguard, as the home life of the average citizen. The change would be good from every standpoint.

"In particular it would be good because it would confer on the Congress the power at once to deal radically and efficiently with polygamy, and this should be done whether or not marriage and divorce are dealt with. It is neither safe nor proper to leave the question of polygamy to be dealt with by the several States. Power to deal with it should be conferred on the National Government.

"When home ties are loosened; when men and women cease to regard a worthy family life, with all its duties fully performed, and all its responsibilities lived up to, as the life best worth living, then evil days for the Commonwealth are at hand."

With the President of the United States committed to and recommending such an amendment, its adoption would seem to be assured. That such an amendment will be proposed at the opening of the next Congress and pressed to a conclusion is confidently predicted.

WASHINGTON, D. C.

The Return

BY SARA H. BIRCHALL

OPEN sky and open sea,
  Wind across the bay;
Now my love comes back to me,
  Shall I say him Nay?

Whitecaps breaking at the pier—
  He comes oversea,
From the maids of half the world
  Turning back to me.

Spring and sun and salty wind,
  Bird and bursting spray;
"Sweetheart! sweetheart!" "O my love,
  Yea, yea, yea!"

CHICAGO, ILL.

Irrigation Projects in Wyoming

BY WILLIAM C. DEMING

EDITOR OF THE "CHEYENNE TRIBUNE."

BY one of those strange caprices of nature with which, for the purposes of this article, it is not necessary to deal, the United States, speaking from a climatic standpoint, is arid, semi-arid and humid. Wyoming is in the semi-arid belt. The average altitude is six thousand feet and the average rainfall about thirteen inches.

Topographically, the area of the State embraces mountains, valleys, plains and high plateaus. Until the advent of dry farming, so called, it has not been practicable to farm in Wyoming without irrigation. With the exception, therefore, of the Wyoming Development Company enterprise at Wheatland, which is reclaiming 50,000 acres of land, and a few others promoted by private capital under the Carey Act, there has been no farming on a large scale. Ranchmen whose holdings lay along the rivers and

CANYON AT NORTH PLATTE RIVER. SITE OF PATHFINDER DAM.

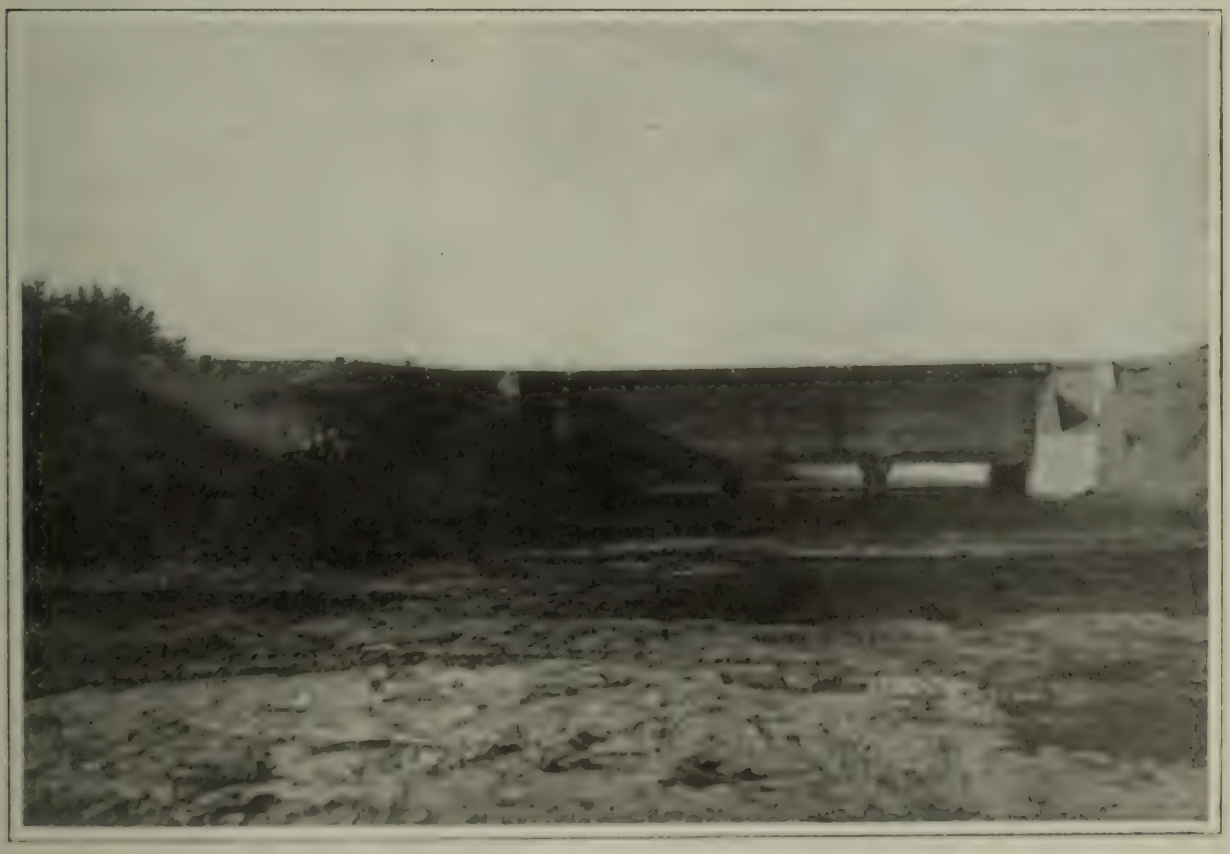
streams have for years, in a limited way, taken out their own ditches and produced surprisingly bountiful crops of wheat, oats, rye, alfalfa and nearly all the vegetables. Yet in a State of 63,000,000 acres this is a necessarily slow process, and if no other and larger method were pursued, the settlement of a State as large in area as all New England and New York combined is a far reach into the future, probably beyond the vision of the present generation.

INTERSTATE CANAL, NORTH PLATTE PROJECT.

Irrigation in Wyoming as well as in Colorado and other States has demonstrated that the brown, bleak plains which for ages have produced naught but sage brush and native grasses for the buffalo and range herds may be made to grow crops not only of great variety, but in astounding quantity; the yield of wheat, for instance, frequently averaging 40 to 50 bushels per acre. The same proportion is found in the production of oats, while alfalfa runs three crops and many tons each season to the acre.

The question naturally arises in the mind of the Easterner: Why is it that a simple combination of water and desert will produce such a result, when the farmer in New York or Ohio is satisfied with one-third of this yield?

New York and Ohio, for instance, are in the rain belt. The rain falls both in and out of season, and is a constant draft upon the chemical energies and forces of the land. The strength of the soil under the drain of frequent rainfall and frequent culture is soon exhausted and must be recuperated by artificial fertilization.



A directly opposite condition prevails in the semi-arid country. The sage brush and native grass lands are rich with the accumulated potash, magnesia, lime and acids of the ages. It will be seen, therefore, that it is only necessary to bring into contact with such a soil the proper amount of water to produce large crops. The man who farms by irrigation has the advantage over the Eastern farmer by reason of the fact that he is in entire control of the season and the situation. He utilizes only so much water as is necessary to mature his crops and thus preserves the natural strength of the soil. The chemical elements or plant foods above referred to, which are quickly leached out of the clayey farms of the East, are held practically intact if the

irrigationist uses a proper system of crop rotation.

It must be plain, therefore, that irrigation is profitable and popular wherever this combination can be brought about. The trouble has been that the areas of arid and semi-arid lands are so vast that it seemed an impossible task to reclaim them. Hence the birth of the National Irrigation Law. The Government disposes of its lands thru the various land laws, to wit, the homestead, desert, timber and stone, and mineral, from which source a large revenue is annually received. The gist of the National Irrigation Law is found in the opening clause of its first section:

"That all moneys received from the sale and disposal of public lands in Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington and Wyoming, beginning with the fiscal year ending June 30th, 1901, including the surplus of fees and commissions in excess of allowances to registers and receivers and excepting the five per centum of the proceeds of the sales of public lands in the above States set aside by law for educational and other purposes shall be, and the same are hereby reserved, set aside, and appropriated as a special fund in the Treasury to be known as the 'reclamation fund' to be used in the examination and survey for the construction and maintenance of irrigation works for the storage, diversion and development of waters for the reclamation of arid and semi-arid lands in the said States and Territories, and for the payment of all other expenditures provided for in this act."

Under this law the reclamation service seeks to find in the above States and Territories large irrigable areas adjacent to large streams whose flood waters can be stored in great reservoirs and conveyed over such areas by canals and laterals, such projects usually being too expensive for private capital. It may be said, however, that private capital is undertaking many pretentious enterprises, but covering smaller areas, and because private capital expects interest and large returns upon its investment the cost of the water right, or the cost of the land and the water right, as the case may be, is frequently high and discouraging to the settler. Under the Government act, the reclamation service, which I believe is one of the most ably and carefully administered in the entire range of Government work, seeks to get back only the money expended

STEEL AND CONCRETE FLUME, INTERSTATE CANAL.

for such enterprises, no more, but no less, great stress being laid upon this point, that each individual enterprise must pay its own way.

The price, therefore, per acre is in proportion to the area and the entire expense of reclamation. Thus one Government enterprise may necessitate a fixed price of $25 per acre, while another may run to $35. The lands are disposed of to the settler in 40, 80, 120 and 160 acre tracts, the limit under the different projects varying according to the acreage required to support a family, and such farms may be paid for in ten annual instalments, the entryman having likewise complied with the homestead laws.

The National Irrigation law is the most ingenious piece of legislation touching the public land question ever devised. It is automatic in its operation and perpetual in its results. All moneys received from the sale of such irrigated farms are paid back into the reclamation fund from which the capital was derived with which to build the works. The meaning and significance of this fact can only be appreciated by a vision of the future, when millions of people shall live upon this desert land and the arid country made to blossom as the rose. It should be borne in mind, however, that with all the available water in use not to exceed 10 per cent. of the arid West can be reclaimed.

In this connection it will be interesting to note that the reclamation fund in 1901 was $3,144,821.91. On June 30th, 1905, it was $28,076,108.02, and by January 1st, 1907, was near the thirty-five million mark. The sale of Wyoming lands in five years has contributed $1,500,000 to the fund.

The Government has undertaken, thru the reclamation service, two large project in Wyoming, the North Platte and the Shoshone, named for the rivers from which they will derive their water supply.

The reservoir site for the North Platte propect is at Pathfinder, lying in the valley of the North Platte river at its junction with the Sweetwater river. The capacity of this reservoir will exceed one million acre feet, and it would cover 23,000 acres to a depth of 42 feet. This reservoir is capable of controlling all the surplus flow—that is, the flood waters of the river for the entire year. The dam is located in a solid box canyon, three miles below the mouth of the Sweetwater, so it will be seen that the Sweetwater will virtually empty into a great lake. The canyon is 60 feet wide at the bottom and 160 feet wide at the top, its extreme hight from bedrock being 200 feet. The foundations have been laid in the solid granite bed of the river.

Proceeding down the river, preliminary surveys have been made for the Goshen Hole Canal. This canal would begin at Guernsey and would be 140 miles long, of which 6 miles would be tunnelled. There are at least 150,000 acres of land which can be irrigated under this canal.

The building of the Goshen Hole Canal means a great deal to Southeastern Wyoming, as the lands in this section are of a fine quality and would support a population of 25,000 people. This canal will be the most important under the Pathfinder project.

The only criticism I desire to offer upon the reclamation service touching the North Platte project is that enough money should be appropriated at once to reclaim lands higher up the river, tributary to Douglas and Casper, and it should at once proceed to construct the Goshen Hole Canal for this reason: While the North Platte River rises in Colorado, it flows northward and eastward more than 300 miles thru Wyoming into Nebraska. The greater part of its waters originates in the snow-clad peaks of Wyoming, and Wyoming is therefore entitled to the benefits. Under the law of prior appropriation, after the completion of the Interstate Canal, there may not remain sufficient water to reclaim the Wyoming lands; whereas, on the other hand, if these lands higher up the river in Wyoming were reclaimed first, the lower areas in Nebraska could still be irrigated, as the drainage and seepage find their way back into the stream and would be again available for the irrigation of Nebraska lands. This is a matter of great importance to Wyoming, and if not settled now may precipitate a legal and equity question similar to the contro-

versy now in progress between Colorado and Kansas over the waters of the Arkansas River.

The most important construction work under the North Platte project is the Interstate Canal, so called because it irrigates lands in Wyoming and Nebraska. The total area under the Interstate Canal approximates 130,000 acres. In this connection it should be understood that the general area to be served by the Interstate Canal embraces other small projects promoted by private capital, among them being the Whalen Falls Canal. These private enterprises have been acquired by the Federal Government and have been made a part of the general system. The first 25 miles of the Interstate Canal involve some difficult points of construction, the most serious being that it must run thru a section of very sandy country, where the loss by seepage is great. This has been overcome by cementing the bottom of the canal thus affected. In a number of places the water from this canal is carried thru flumes. None of these flumes is of wood, as is usually found, but all are built of steel and cement.

Work on the Pathfinder Dam and the Interstate Canal have progressed rapidly. The first 50 miles are already furnishing water at several places for irrigation. The canal has been divided into sections, and contracts have been awarded on fourteen different schedules of this great distributing system, and work on the laterals is in progress. Settlers are coming in rapidly, and probably 40,000 acres will be irrigated this year.

WHALEN CANAL

Before leaving the North Platte project, it is interesting to note that the great Pathfinder Dam, at the junction of the Sweetwater and North Platte rivers, will contain more than 50,000 cubic yards of masonry and will have a storage capacity ten times greater than the Croton Reservoir, which supplies the city of New York. This dam will form a narrow lake 25 miles long.

In Big Horn County, in Northern Wyoming, work is progressing on another big national irrigation enterprise which has been given the name of the Shoshone

project, the water being supplied from the Shoshone River.

This system will irrigate lands on the north side of the river east of Cedar mountain and lands on the south side of the river east of McCullough Peak. The land is of a high quality and lies in gently sloping mesas, which are comparatively easy to reclaim. The Shoshone project will irrigate upward of 200,000 acres, will provide homes for 2,500 families, which, together with the cities which will spring up, will support a population of 50,000 people.

The site chosen for the Shoshone Dam is in a gorge of solid granite 70 feet wide at the bottom, 200 feet wide at the top and 250 feet deep. An arched dam is being built, which means that the dam will curve upstream, so that the water pressure will be met by a convex surface, this arch being 108 feet wide at the bottom and tapering to 10 feet at the top.

The Government has adopted for this work the most advanced ideas of scientific concrete construction, concrete forming 75 per cent. of the dam, granite rock weighing from 75 to 200 pounds each being set in by hand and rammed until well bedded. The rocks are distributed uniformly thruout the dam, forming the remaining 25 per cent. of its construction, a cross section having the appearance of a huge slice of nut cake. This dam will cost $515,000.

The Shoshone Reservoir will supply water for a number of canals favorably distributed over the irrigable section. In order to reach lands northward of the Shoshone River toward Frannie, on the Chicago, Burlington and Quincy Railroad, it was necessary to construct what is called the Corbett Tunnel, which, on account of the shale and sandstone thru which it runs, is lined with concrete. This tunnel is about 3 miles long, with a 10-foot bore.

It should be borne in mind that the cost of the dam does not embrace the entire cost of the system. Hundreds of thousands of dollars will be required for the tunnel thru the canyon, for the high line canal, also the Corbett Tunnel, a half dozen other canals and the numerous

DAM SITE IN CANYON, SHOSHONE PROJECT.

laterals. When this project is completed, as it will be in three years, it will in time transform 200,000 acres of cactus and sage brush land into as productive an area as is found in the famous Greeley district of Colorado or in the irrigated sections of Southern California.

The National Irrigation Law is indeed the most remarkable piece of legislation looking to large internal improvements ever devised. It is the result of the combined wisdom and experience of many Western State engineers and Western members of Congress. Yet, sound as it is, and far reaching in its results, it probably would have remained a mere dream of the West for many years had not President Roosevelt, once a Western ranchman, thrown the weight of his influence in its favor thru his first message to Congress.

What the Government is accomplishing in Wyoming it is also doing in Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Montana, Washington and Oregon.

Those who have already witnessed the "before" and the "after" cannot fail to endorse and enthuse over this self-supporting Government automaton, which will make the "Great American Desert" as productive as the irrigated valley of the Nile.

CHEYENNE, WYOMING.

The Middle Class Between the Millstones*

BY H. G. WELLS

AUTHOR OF "A MODERN UTOPIA," "THE WAR OF THE WORLDS," ETC.

FOR a century or more the grinding out of the middle class has been going on. The "Bitter Cry" is not a new one, and to me at least it seems quite the most important social fact of this and the last century. I began to find it interesting, altogether too interesting indeed, when I was still only a little boy. My father was one of that multitude of small shopkeepers which has been caught between the "Stores" and such like big distributors above and the rising rates below, and from the knickerbocker stage onward I was acutely aware of the question hanging over us. "This isn't going on" was the proposition. "This shop in which your capital is invested will never return it. Nobody seems to understand what is happening, and there is nobody to advise or help you. What are you going to do?"

Except that we are beginning to understand a little now what it all means, exactly the same question hangs over many hundreds of thousands of households today, not only over the hundreds of small shopkeepers, but of small professional men, of people living upon small parcels of investments, of clerks and such like who find themselves growing old and their value depreciated by the competition of a new, better educated generation, of private schoolmasters, of boarding and lodging house keepers and the like. They are all vaguely aware of something more than personal failure, of a drift and process which is against all their kind, of the need of "doing something" for themselves and their children, something different from just sticking to the shop or the "situation"—and they don't know what to do! What ought they to do?

Well, first, before one answers that, let us ask what it is exactly that is grinding the middle class in this way? Is it a process we can stop? Can we direct the millstones? If we can, ought we to do so? And if we cannot or decide that it isn't worth while, then what can we do to mitigate this cruelty of slowly impoverishing and taxing out of existence a class that was once the backbone of the community? It's not mere humanity dictates this much. It is a question that affects the State as a whole. It must be

* Copyrighted in the United States of America and all countries signatories of the Berne Convention

extremely bad, for the spirit of the nation and for our national future, that its middle mass should be in a state of increasing financial worry and stress, irritated, depressed and broken in courage. One effect is manifest in our politics now. Each fresh election turns upon expenditure more evidently than the last, and the promise to reduce taxation or lower the rates overrides more and more certainly every other consideration. What are empire or education to men who feel themselves drifting helplessly into debt? What chance has any constructive scheme with an electorate of men who are being slowly submerged in a sort of economic bog?

The process that has brought the middle class into these troubles is a complex one, but the essential thing about it seems to be this, that there is a *change of scale* going on in most human affairs, a substitution of big organizations for detached individual effort almost everywhere. A hundred and fifty years ago or so the only very rich people in the community were a handful of great landowners and a few bankers, the rest of the world's business was being done by small, prosperous, independent men. The laborers and poor were often very poor and wretched, ill clad, bootless, badly housed and short of food, but there was nevertheless a great deal of middle-class comfort and prosperity. The country was covered with flourishing farmers, every country town was a little world in itself, with busy tradespeople and professional men, manufacturing was still done mainly by small people employing a few hands; master and apprentice worked together; in every town you found a parish school or so, an independent doctor and the like, doing well in a mediocre, comfortable fashion. All the carrying trade was in the hands of small independent carriers; the shipping was held by hundreds of small shipowners. And London itself was only a larger country town. It was, in effect, a middle-class world ruled over by aristocrats; the millstones had as yet scarcely stirred.

Then machinery came into the lives of men, and steam power, and there began that change of scale which is going on still today, making an ever-widening separation of master and man, and an ever-enlarging organization of industry and social method. Its most striking manifestation was at first the substitution of organized manufacture in factories for the half domestic hand industrialism of the earlier period; the growth of the fortunes of some of the merchants and manufacturers to dimensions comparable with the wealth of the great landowners, and the sinking of the rest of their class toward the status of wage-earners. The development of joint stock enterprise arose concurrently with this to create a new sort of partnership capable of handling far greater concerns than any single wealthy person, as wealth was measured by the old scale, could do. There followed a great development of transit, culminating for a time in the coming of the railways and steamships, which abolished the isolation of the old towns and brought men at the remotest quarters of the earth into business competition. Big towns of the modern type, with half a million inhabitants or more, grew up rapidly all over Europe and America. For the European big towns are as modern as New York, and the East End or South Side of London is scarcely older than Chicago. Shopkeeping, like manufactures, began to concentrate in large establishments, and big wholesale distribution replaced individual buying and selling. As the need for public education under the changing conditions of life grew more and more urgent, the individual enterprise of this schoolmaster and that gave place to the organized effort of such giant societies (in Britain) as the old National School Society and the British School Society, and at last to State education. And one after another the old prosperous middle-class callings fell under the stress of the new development.

The process still goes on, and there can be little doubt of the ultimate issue. The old small manufacturers are either ruined or driven into sweating and the slums; the old coaching innkeeper and common carrier have been impoverished or altogether superseded by the railways and big carrier companies; the once flourishing shopkeeper lives today on the mere remnants of the trade that great distributing stores or the branches of great companies have left him. Tea companies, provision dealing companies,

tobacconist companies make the position of the old-established private shop unstable and the chances of the new beginner hopeless. Railways and tramways take the custom more and more effectually past the door of the small draper and outfitter to the well-stocked establishments at the center of things; telephone and telegraph assist that shopping at the center more and more. The small "middle-class" schoolmaster finds himself beaten by revived endowed schools and by new public endowments; the small doctor, the local dentist, find Harley street always nearer to them and practitioners in motor cars from the great centers playing havoc with their practices. And while the small men are more and more distressed, the great organizations of trade, of production, of public science, continue to grow and coalesce, until at last they grow into national or even world trusts or into publicly owned monopolies. In America slaughtering and selling meat has grown into a trust; steel and iron are trustified; mineral oil is all gathered into a few hands. All thru the trades and professions and sciences and all over the world the big eats up the small, the new enlarged scale replaces the old.

And this is equally true, tho it is only now beginning to be recognized, of the securities of that other section of the middle-class, the section which lives upon invested money. There, too, big eats little. There, too, the small man is more and more manifestly at the mercy of the large organization. It was a pleasant illusion of the Victorian time that one put one hundred pounds or a thousand pounds "into something," beside the rich man's tens of thousands, and drew one's secure and satisfying dividends. The intelligent reader of Mr. Lawson's "Frenzied Finance" or of the bankruptcy proceedings of Mr. Hooley realizes this idyll is scarcely true to nature. Thru the seas and shallows of investment flow great tides and depressions, on which the big fortunes ride to harbor while the little accumulations, capsized and swamped, quiver down to the bottom. It becomes more and more true that the small man saves his money for the rich man's pocket. Only by drastic State intervention is a certain measure of safety secured for insurance, and in America recently we have had the spectacle of the people's insurance money used as a till by the rich financiers.

And when the middle-class man turns in his desperation from the advance of the big competitor who is consuming him, as a big codfish eats its little brother, to the State, he meets a tax paper; he sees, as the State's most immediate aspect, the rate collector and inexorable demands. The burden of taxation certainly falls upon him, and it falls upon him because he is collectively the weakest class that possesses any property to be taxed. Below him are classes either too poor to tax or too politically effective to stand taxation. Above him is the class which owns a large part of the property in the world, but it also owns the newspapers and periodicals that are necessary for an adequate discussion of social justice, and it finds it cheaper to pay a voluntary tax to the hoardings at election time than to take over the small man's burthens. He rolls about between these two parties, antagonized first to one and then the other, and altogether helpless and ineffectual. So the millstones grind, and so it would seem they will continue to grind until there is nothing between them, until organized property in the hands of the few on the one hand and the proletariat on the other grind face to face. So at least Karl Marx taught in "Das Kapital."

But when one says the middle class will disappear, one means that it will disappear as a class. Its individuals and its children will survive, and the whole process is not nearly so fatalistic as the Marxists would have us believe. The new great organizations that are replacing the little private enterprises of the world before machinery, are not all private property. There are alternatives in the matter of handling a great business. To the exact nature of these alternatives the middle-class mind needs to direct itself if it is to exert any control whatever over its future. Take the case of the butcher. It is manifestly written upon the scroll of destiny that the little private slaughter house, the little independent butcher's shop buying and selling locally must disappear. The meat will all be slaughtered at some great conveniently organized center, and distributed thence

to shops that will necessarily be mere agencies for distributing meat. Now this great slaughtering and distributing business may either be owned by one or a group of owners working it for profit—in which case it will be necessary for the State to employ an unremunerative army of inspectors to see that the business is kept decently clean and honest—or it may be run by the public authority. In the former case the present day butcher, or his son, will be a slaughterman or shopkeeper employed by the private owners; in the latter case by the public authority. This is equally true of a milk-seller, of a small manufacturer, of a builder, of a hundred and one other trades. They are bound to be incorporated in a larger organization, they are bound to become salaried men where formerly they were independent men, and it is no good struggling against that. It is doubtful indeed whether from the standpoint of welfare it would be worth the middle-class man's while to struggle against that. But in the case of very many great public services, meat, milk, bread transit, housing and land administration, education and research, and the public health, it is still an open question whether the big organization is to be publicly owned, publicly controlled and constantly refreshed by public scrutiny and comment, or whether it is to be privately owned, and conducted solely for the profit of a small group of very rich owners. The alternatives are Plutocracy or Socialism, and between these the middle-class man remains weakly undecided and ineffectual, lending no weight to and getting small consideration therefore from either side. He remains so because he has not grasped the real nature of his problem, because he clings in the face of overwhelming fate to the belief that in some way the wheels of change may be arrested and his present method of living preserved.

I think if he could shake himself free from that impossible conservatism he would realize that his interests lie with the interests of the intelligent working-class man, that is to say in the direction of Socialism rather than in the direction of capitalistic competition—that the best use he can make of such educational and social advantages as still remain for him is to become the willing leader instead of the panic-fierce antagonist of the socialist movement. His place, I hold, is to forward the development of that State and municipal machinery the socialist foreshadows, and to secure for himself and his sons and daughters an adequate position and voice in the administrations. Instead of struggling to diminish that burthen of public expenditure which educates and houses, conveys and protects him and his children, he ought rather to increase it joyfully, while at the same time working manfully to transfer its pressure to the broad shoulders of those very rich people who have hitherto evaded their legitimate share of it. The other course is to continue his present policy of obstinate resistance to the extension of public property and public services, in which case these things will necessarily become that basis of monopolistic property on which the coming plutocracy will establish itself. The middle-class man will be taxed and competed out of independence just the same, and he will become a salaried officer just the same but with a different sort of master and under different social conditions according as one or other of these alternatives prevails.

Which is the better master—the democratic State or a "combine" of millionaires? Which will give the best social atmosphere for one's children to breathe—a plutocracy or a socialism? That is the real question to which the middle-class man should address himself.

No doubt to many minds a plutocracy presents many attractions. In the works of Thomas Love Peacock and still more clearly in the works of Mr. W. H. Mallock you will find an agreeable rendering of that conception. The bulk of the people will be organized out of sight in a state of industrious and productive congestion, and a wealthy, leisurely and refined minority will live in spacious homes, with excellent museums, libraries, and all the equipments of culture, will go to town, concentrate in Paris, London and Rome, and travel about the world. It is to these large luxurious, powerful lives that the idealist naturally turns. Their motor cars, their aeroplanes, their steam yachts will awaken terror and respect in every corner of the globe. Their

handsome doings will fill the papers. They will patronize the arts and literature, while at the same time mellowing them by eliminating that too urgent insistence upon contemporary fact which makes so much of what is done today harsh and displeasing. The middle-class tradition will be continued by a class of stewards, tenants, managers and foremen, secretaries and the like, respected and respectful. The writer, the artist, will lead lives of comfortable dependence, a link between class and class, the lowest of the rich man's guests, the highest of his servants. As for the masses, they will be fed with a sort of careless vigor and considerable economy from the Chicago stockyards, and by agricultural produce-trusts, big breweries, freshwater companies and the like; they would be organized industrially and carefully controlled. Their spiritual needs will be provided for by churches endowed by the wealthy, their physical distresses alleviated by the hope of getting charitable aid, their lives made bright and adventurous by the crumbs of sport that fall from the rich man's table. They will crowd to see the motor car races, the aeroplane competitions. It will be a world rich in contrasts and not without its bright gleam of pure adventure. Every bright young fellow of capacity will have the hope of catching the eye of some powerful personage, of being advanced to some high position of trust, of even ending his days as a partner, a subordinate assistant plutocrat. Or he may win a quite agreeable position by literary or artistic merit. A pretty girl, a clever woman of the middle-class, would have before her even more brilliant and romantic possibilities.

There can be no denying and promises of color and eventfulness a plutocracy holds out, and tho they do not attract me I can quite understand their appeal to the more ductile and appreciative mind of Mr. Mallock. There is, it is said, a tendency in plutocracies either to become unprogressive, unenterprising and stagnantly autocratic or to develop states of stress and discontent and so drift towards Cæsarism. The latter was the fate of the Roman Republic and may, perhaps, be the destiny of the budding young plutocracy of America. But the developing British plutocracy, like the Carthaginian, will be largely Semitic in blood, and like the Carthaginian may resist these insurgent tendencies.

So much for the plutocratic possibility. If the middle-class man on any account does not like that outlook, he can turn in the other direction, and then he will find fine promises indeed, but much more uncertainty than towards plutocracy. Plutocracies the world has seen before, but a democratic civilization organized upon the lines laid down by modern Socialists, would be a new beginning in the world's history. It is not a thing that will come about by itself, it will have to be the outcome of a sustained moral and intellectual effort in the community. If there is not that effort, if things go on as they are going now, the coming of a plutocracy is inevitable. That effort I am convinced, cannot be successfully made by the lower-class man alone, for him unaided and unguided there is nothing to be expected but wild convulsive attempts at social upheaval, which, whether they succeed (as the French Revolution did) or fail, as did the insurrectionary outbreaks of the Republic in Rome, lead ultimately to a Napoleon or a Cæsar. But our contemporary civilization is unprecedented in the fact that the whole population now reads, and that intelligence and free discussion saturates the whole mass. Only time can show what possibilities of understanding, leadership and political action lie in our new generation of the better educated middle-class. Will it presently begin to define a line for itself? Will it remain disorganized and passive, or will it become intelligent and decisive between these millstones of the organized property and the organizing state, whose opposition is the supreme social and political fact in the world at the present time.

LONDON, ENGLAND

Literature

The Whirlwind

EDEN PHILLPOTTS's new novel* is his masterpiece. Compared with it his other stories are mere stammerings of the message of Dartmoor. They have all been marred by a sort of human feebleness to such an extent that Dartmoor itself was the real hero. It stretched like a huge, naked carcass of the earth, bleak and terrible, informed with a tragic vitality by the side of which the emotions of the human hero, however extravagant, seemed puerile; he was merely a distracted creature whipped on to a dark fate by the awful spirit of the place. But in this new novel Phillpotts has at last made nature and human nature mean the same thing. They have a spiritual likeness in common. The man and the moor are one, and beat upon one another's breasts in vain, each being elemental or indestructible in character.

Daniel Brendon, hired man to Hilary Woodrow, owner of Ruddyford Farm, is the simple Titan, the great primitive man, who has that directness toward God which unmade souls always show. His mighty limbs, his tender heart, his fierce temper, were merely those first things a man wins toward the perfection of his type. Then he had that noble stupidity which spent itself in prayer, and in the exercise of a faith like the instinct in cows, which causes them to rise in the middle of the night and lie down again with their heads to the East and the coming day. It was the mighty hint in him of future glory. Such are some of the intimations to be drawn from the character of Brendon. And the wonder of the book, considered from the dramatic point of view, is the grossness, strength and persistence of his ideality. It renders him at once the victim and the avenging whirlwind. He is duped both by his master and his wife, and in the last scene we find him bereaved of every earthly hope, homeless and loveless, on his knees in prayer. He is huge, almost contemptible in his narrowness, yet showing still a stern grandeur of the spirit, a steadfastness like that of the ancient shoulders of Dartmoor, about which the winds rage and the storms beat in vain. His unlovely but tremendous faith survived all human unfaithfulness, as instinct survives the mere incident of experience. It was the eternal quality in the man, just as it is the granite quality of the great tors and grave-bosomed hills of Dartmoor, which makes the ages but shadows passing.

And as Brendon resembled the moor in this aspect, so his wife, Sarah Jane, is like it drenched in dew, suffused with morning light. She is the recurrent smile upon the face of it, a pearl woman, with a large, placid, giving nature, and that dangerous innocency of the mind which makes some women so unmodest and so unscrupulous. Life is not hidden in them like a secret passion, but it is revealed like the heart of the rose. So Sarah Jane abandons herself to her lover and husband. And nothing can surpass the wisdom and tenderness with which she endures his religion. Having no willing faith of her own in God, the largeness of her nature encompasses him about as the heavens hold the earth.

But such people are never to be trusted morally. Their nature is so much for giving that they lack that part of virtue which withdraws and withholds. So Sarah Jane, the splendid wife-woman, the bountiful mother, makes a commodity of herself at last, a double sacrifice, first to advance the interests of her husband, second to satisfy the hunger of Woodrow, whose loneliness and feebleness appealed to her compassion and to her profligate willingness to give all she has. This has been done before in real life and in fiction, but rarely with the significance that Phillpotts imparts to the act. Many will be reminded of Tess of the D'Urbervilles in the likeness of Sarah Jane; but the passing of this Roman-spirited woman is dramatized with a power very different from the nice, subtle, discriminating intelligence displayed by Thomas Hardy. It was her final, supreme gift of love, the last red glow of the summer sun at evening upon Amicombe Hill.

One cannot recommend such people in

* THE WHIRLWIND. *By Eden Phillpotts.* New York: McClure & Phillips. $1.50.

a world like this. We are too mean, too starved and grasping not to take and steal all they have, as the men in this story take all from Sarah Jane; but it is very well to have her proclaimed to us now and then like a prophecy from a writer like Phillpotts. There are other incidents and other characters in the book which make it interesting and suggestive. But these two and the lonely moor overshadow all and give it a great meaning.

The Ethics of Egoism

THE newspapers have a fad of referring to intellectual radicals as "highbrows." The appellation may well have originated with Johann Kaspar Schmidt, who had such a high forehead that his schoolmates called him *Maximus Stirn.* He seems to have been better suited with his nickname than most boys are, for when he came to publish his book Max Stirner was put down as the author's name. That was more than sixty years ago. The book was practically forgotten by the world in less time than it took to write. But the conscientious German scholar allows nothing in his field to escape him, and historians of philosophy like Lange and Hartmann felt obliged to include mention of Stirner as the extremest of theoretical anarchists. It was thru these clews that he was rediscovered and brought into the all-embracing current of modern thought. Translations have appeared in several languages within the last dozen years, and now Benjamin R. Tucker, of Liberty, has introduced it to English readers.*

The work is essentially untranslatable. Even the title, *Der Einzige und sein Eigentum,* cannot be satisfactorily rendered into English. *The Ego and His Own* is well enough; "The Unique One and His Property," tho more exact, is intolerable; inspired by something of the author's self-assertion and disregard for all rules we venture to express our opinion that "Me and Mine" is better than any of the alternatives suggested. In one respect the translation is better than the original, for it betrays by its inevitable inadequacy how much of Stirner's argument is dependent for its force on verbal juggling with *Eigen, Eigenthum, Eigenschaften* and *geeignet.*

But what interests one in Stirner is not his argument, but his audacity. He challenges all the principles and rules of conduct that civilization imposes upon those who share its benefits. He acknowledges no restrictions upon his acts except those of self-interest. Selfish people are all too common in the world, but those who profess selfishness as their sole guiding principle in life, like Max Stirner, are sufficiently rare to attract attention. Stirner reversed the ordinary relation of precept and practice. His life was better than his creed. He appears to have been a dutiful son, a faithful husband, and could hardly be called an undesirable citizen. He was a mild-mannered teacher in a young ladies' seminary. He was not a revolutionist, but an insurgent. He urged men to disregard the State, not to overthrow it. Let each man straighten himself up and then see what becomes of this thing they call the State, and consider an organism. In the same way he would absolve himself from all obligations to his fellowmen:

> "No one is my equal, but I regard him, equally with all other beings as my property. For me no one is a person to be respected, not even the fellow-man, but, solely like other beings, an *object* in which I take an interest or else do not, a usable or unusable person. And if I can use him, I doubtless come to an understanding and make myself at one with him, in order by the agreement, to strengthen *my power,* and by combined force to accomplish more than individual force could effect. In this combination I see nothing whatever but a multiplication of my force, and I retain it only so long as it is *my* multiplied force.
>
> "Where the world comes in my way—and it comes in my way everywhere—I consume it to quiet the hunger of my egoism. For me you are nothing but—my food, even as I, too, am fed upon and turned to use by you. We have only one relation to each other, that of *usableness,* of utility, of use. We owe *each other* nothing, for what I seem to owe you I owe at most to myself. If I show you a cheery air in order to cheer you likewise, then your cheeriness is of consequence to *me* and my air serves *my* wish: to a thousand others, whom I do not aim to cheer I do not show it."

As a pure anarchist Stirner attacks socialism as bitterly as he does the estab-

* THE EGO AND HIS OWN. *By Max Stirner.* Translated from the German by *Steven T. Byington.* With an introduction by J. L. Walker. New York: Benj. R. Tucker. $1.00.

lished order, for socialism also has its ideals and would therefore be equally tyrannical in subordinating the interests of the individual to them. He differs from Nietzsche, whom he is supposed to have inspired, in that he recognizes no duty to the future. He has no such ideal as that of a coming superman, which, to a certain extent, ennobles the ruthless brutality of Nietzsche. Nor has he Nietzsche's brilliant and lurid style. The book is involved and incoherent, and even curiosity to see what can be said by an *advocatus diaboli* will not tempt many to read it.

Documents in Cheerfulness

As the Lord loveth a cheerful giver, so the people delight in the bringer of good news. The four books under review* are welcome documents in the philosophy of cheerfulness. Mr. Hillis delivers a panegyric upon the splendors of our generation and country, and Mr. Allen illustrates the encomium with an account of the beneficent achievements of our contemporary political leaders; Mr. Baker pronounces a sequence of discourses upon the essential excellence of Anglo-Saxon character, and President Eliot unfolds that excellence in the lives of a group of American great men. Taken together, these books leave one in a mood to adopt Dr. Hale's counsel, to "look up and lend a hand."

The *Fortune of the Republic* and *American Problems* will make an especially strong appeal to readers who cherish pleasant memories of Chautauqua assemblies and university extension lectures. The intention of both of them is to stimulate faith in the excellence of life and to call attention to what is delightful and of good omen in things as they are. Mr. Hillis's point of view is that of the pulpit. In the Christian Church he finds the guarantee of our fairest desires: "Men are uniting their dreams, unifying their hopes, reorganizing their aspirations and their plans, and when all is complete, we shall have in this Republic a unit church—with the unity of the faith and the unity of the knowledge of the Son of God." Mr. Baker exhorts us to vigorous action from the lectern of the college chapel—he is president of the University of Colorado—and he summarizes his teaching when he declares that "the hope of progress is not in legislation, but in character." "Be men," say these teachers to the rising generation, "look on the sunny side of things, and the entire world will be given unto you."

America's Awakening and *Four American Leaders* are more satisfactorily stimulating than their two predecessors in this group, because they are made of somewhat sounder stuff, they deal more immediately with realities, are less pedantic, have in them more of the air of the actual world. The chapters in Mr. Allen's book are examples of the best kind of journalism that we in our generation know anything about—a journalism that has a scholarly regard for facts, but avoids being abstruse and academic. In reading Mr. Allen's volume one feels that the author is a happy cross between the newspaper reporter and the well-trained college instructor. His acounts of the good government campaigns of President Roosevelt, Senator LaFollette and Governor Folk are as vivid as if they were stories of yesterday's news and now first printed in the morning paper. But they are better than the ordinary newspaper story, because they bear the signature of a philosophic mind. Mr. Allen is inspired by the conviction that the people of America are assuming more direct control than ever before of their public affairs; and all of his chapters in turn reflect "different aspects of a larger tendency, which is bringing this nation, even while it grows in size, closer to the conditions of a pure democracy." *America's Awakening* is a good book and especially refreshing because it sails close to the facts and avoids the sins of declamation.

And the inspiration that Mr. Allen derives from his study of our contemporary leaders, President Eliot discovers in a larger and more serene way in Franklin, Washington, Channing and Emerson, the great leaders of our past. These four essays have the distinction,

* FOUR AMERICAN LEADERS. *By Charles W. Eliot.* Boston: American Unitarian Association. 80 cents.
AMERICA'S AWAKENING. *By Philip Loring Allen.* New York: Fleming H. Revell. $1.25.
AMERICAN PROBLEMS. *By James H. Baker.* New York: Longmans, Green & Co. $1.20.
THE FORTUNE OF THE REPUBLIC. *By Newell Dwight Hillis.* New York: Fleming H. Revell. $1.20.

the tranquil beauty and mellow wisdom of classics. The essay on Channing is especially charming, and that upon Emerson in some respects the noblest tribute that has ever been paid to the Concord philosopher. President Eliot writes: "As a young man I found the writings of Emerson unattractive and not seldom unintelligible. I was concerned with physical science, and with routine teaching and discipline; and Emerson's thinking seemed to me speculative and visionary. . . . But when I had got at what proved to be my life-work for education, I discovered in Emerson's poems and essays all the fundamental motives and principles of my own hourly struggle against educational routine and tradition, and against the prevailing notions of discipline for the young; . . . very many of the sober practical undertakings of today were anticipated in all their principles by this solitary, shrewd, independent thinker." What an acknowledgment from the most richly experienced of living educators! And here again, as in Mr. Allen's book, the statement is the more impressive because it rings with the sincerity of a man who knows his facts. We have rarely read a book which could inspire a more profound respect for what is lastingly noble in humanity than this. President Eliot performs the highest office of the academician when, as here, he keeps alive our sense of what has been noble in the past.

Lew Wallace. An Autobiography. 2 vols. New York: Harper & Brothers. $5.00.

It is two years since the death of Major-General Lew Wallace. His service to the Union, begun in the Mexican War, continued thru the Civil War, and was fittingly supplemented by a service to literature in authorship, of which the rarest results were the two well-known stories, "The Fair God" and "Ben Hur." The *Autobiography* proper, as now published, terminates with the battle of the "forlorn hope" at Monocacy Junction, July 9th, 1864, when Wallace and his small band of raw troops stood off for a day the memorable advance of Jubal Early on Washington. The story of Wallace from 1864 to the time of his death is told under the eye of Sarah Elston Wallace, whose golden wedding had been celebrated in 1902. Quite equal in vividness to his fiction is the dramatic interest with which General Wallace manages to invest the story of his life in some of its vital facts. These were, from his point of view, chiefly the rescue, for the Union cause, in 1861, of the Baltimore & Ohio Railroad, in the bloodless battle at Romney. Secondly, the successful final assault at Fort Donelson, by which was recovered the ground lost by McClernand, Wallace being the first to enter the tents of the vanquished foe. In the battle he won a major-general's commission. But, unhappily, he lost the sunshine at Grant's headquarters by failing to endorse a lie for two members of the staff. Thereafter, he says:

"I was forced to take notice of a winter that had fallen upon the occupants there—a kind of interior winter peculiar in that it reserved its frost and ice for me. Still, General Grant's demeanor continued friendly. . . . After awhile, however, the winter reached him."

Thirdly, came the headless first day fight of Shiloh. That it was headless, confused and a sorry bungle, General Wallace gives many pages to prove. The situation of the Union and Confederate forces is stated with remarkable clearness; the surprise, disorder and ultimate rout that night are told at great length and with abundant documentary supports which will be considered in the military courts martial that still sit, and will sit, with an audience of grandchildren, as long as any survivors exist to "fight their battles o'er again." General Wallace himself arrived on the scene that Sunday night in time to plant a battery for the morrow and to lie down to sleep, if he could sleep, "only thru the soughing of the wind," he says, "and the splash of water one voice from the front kept crying: 'Help! Help!'" Because he failed to arrive earlier, a line in Grant's account of the day brought troubles with the great general, and with that "incomparable marplot," Halleck, troubles only to be brought to an end a year later by the kindly word of General Sherman. Wallace in that interval had been for the most part an ill used, unused soldier. He was now restored to command and

sent to Baltimore, where he performed service highly satisfactory to Mr. Lincoln, at the time when the vote was taken in Maryland for and against emancipation, and when it became sometimes desirable that a little red tape should be severed—that the soldiers, in short, should be in two places at once—a mile from the polling places and yet handy in case of "petitions" for help from loyal voters—petitions properly "endorsed" by the civil authorities.

Water Transportation, Ocean and Inland. By Emory R. Johnson. New York: D. Appleton & Co. $1.50.

A useful addition to Appleton's business series of commercial text books is Dr. E. R. Johnson's comprehensive monograph on *Ocean and Inland Water Transportation.* The author approaches the subject from the professorial point of view, but his fitness for the task in hand was doubtless largely increased by his experience as a member of the Isthmian Canal Commission. The purpose for which his book was written is distinctly educational, and thus regarded it merits recognition as valuable to the relatively small class of readers seeking a better knowledge of the shipping business, or desirous of aiding in the upbuilding of American commerce. For the general reader the book has comparatively little interest, since it is necessarily elementary in matters most likely to attract him and tiresomely full of bills of lading, ship's papers of one kind or another, marine insurance, port regulation, etc. The value which resides in the historical portions of Dr. Johnson's book is due chiefly to the fact that it is highly condensed and easily understood. His explanations of the rise and decline of American shipping are clear, and in making them he has wisely avoided the purely controversial discussion of the commercial policy of the United States since 1860. The list of standard works which concludes each chapter constitutes a very complete and valuable bibliography of water carriage, naval architecture and marine engineering, as well as so much of political economy as deals with international commercial relations. Confronted as we are by what must be recognized as a revolution in marine engineering which promises to relegate the reciprocating engine to disuse, it is rather disappointing to find an author as intelligent as Dr. Johnson so discreet in the discussion of the turbine as a motor for steam vessels as to say, in effect, that while this type of engine has certain admitted advantages, its economy is not fully established. Unfortunately, before the ink on his pages was dry, the remarkable performances of the "Dreadnought," with a record of 23 knots an hour, with turbine propulsion, has upset all the accepted theories of Continental and American naval architects and set a pace which they will find it difficult to follow. What they will think when the heavily armored cruisers now building on the Clyde, not mere dispatch boats, but with a broadside fire as heavy as that of the "Dreadnought," realize with turbine propulsion the confident prediction of 27 knots an hour, Dr. Johnson does not suggest. Probably he does not know, and it is on just such points that the assistance of a skilled naval engineer would have given his book much greater value than it possesses.

Il Libro D'Oro, of Those Whose Names Are Written in the Lamb's Book of Life. Translations by Mrs. Francis Alexander. Boston: Little, Brown & Co. $2.00.

The Golden Sayings of the Blessed Brother Giles, of Assisi. Newly translated and edited together with a sketch of his life. By the Rev. Fr. Paschal Robinson. Philadelphia: The Dolphin Press. $1.00.

The Coming of the Saints. Imaginations and Studies in Early Church History and Tradition. By John W. Taylor. New York: E. P. Dutton & Co. $3.00.

One guilty of the superstition that medieval piety was altogether barren and mechanical would do well to spend an hour or so over the legends and miracle stories which Mrs. Alexander has translated from the Italian fathers, or the equally spiritual meditations of the companion of St. Francis. Mrs. Alexander has rendered over a hundred of the effusions of the devout and credulous Italian saints of the fourteenth century, and many of the legends are of real beauty and true spirituality. Brother Giles' *Golden Sayings* are well worthy the careful and pleasing translation which the Rev. Paschal Robinson, of the Order

of Friars Minor, has given them, as well for their sincere and earnest piety as for the singular beauty and picturesqueness of their expression. The vocabulary is medieval, but any truly religious heart of the present age may easily find both instruction and encouragement from such genuine testimony of holy devotion and love. The translator's introduction evidences careful scholarship. Mr. Taylor's attempt to describe the missionary conquests of Christianity on the basis of legend, and without effort to disentangle legend from history, is less successful. It is doubtless true that those who have cast aside the stories of the saints have rejected much that is worthy of preservation, but this fact does not justify uncritical use of medieval miracle stories in the attempt to write history.

The Stars and Stripes, and Other American Flags. By Peleg D. Harrison. Illustrated in colors. Boston: Little, Brown & Co. $3.00.

If there remains any published incident relating, however distantly, to the American flag, which is not told in these 407 pages, we should hardly know where to look for it. Newspapers, books and even letters have evidently been searched with a painstaking care to see that nothing got away. In the matter of inclusiveness, therefore, there is little criticism to be made. And yet something of this inclusiveness might profitably have been sacrificed for a more methodical arrangement and a more critical spirit of inquiry. It can hardly be said that any new light is thrown upon the reasons for choosing the stars and stripes rather than some other device for our national emblem. Perhaps the addition of white stripes (possibly as a symbol of liberty) to the red ensign of Great Britain—the theory favored by our author—is as good an explanation as any. Certainly the once accepted explanation which found the origins of our emblem in the coat of arms of the Washington family seems more untenable the closer it is examined. That among the earlier banners the "pine-tree flag," with its green tree on a white field, and its legend, "An Appeal to Heaven," was the more commonly used on sea, while the "rattlesnake flag" was the more commonly used on land, seems evident from the abundant material here gathered. No earlier use of the "Grand Union flag," with its thirteen red and white stripes and its crosses of St. George and St. Andrew, has been discovered than that by Captain Abram Markoe's Philadelphia troop of light horse in the summer of 1775. It was not displayed by Washington's Boston army until the 1st of January following. There is still dispute as to where the Stars and Stripes was first unfurled in battle, tho the partisans of Fort Stanwix, where a rude flag, somewhat after the manner of the device adopted by Congress on June 14th, 1777, was displayed on August 2d of the same year, would seem to have the greater support to this claim.

The Consular Service of the United States. By Chester Lloyd Jones. Publications of the University of Pennsylvania Series in Political Economy and Public Law, No. 18. Philadelphia: The J. C. Winston Co. Pp. ix + 126. $1.50.

In view of the present demand for reform in the consular service, this monograph is a timely contribution to the literature on the subject. The author confines himself mainly to the history and organization of the United States consular system, but gives, in addition, some interesting information regarding the consular service of the principal European countries. In comparison with the American system, those of the European countries in some respects are superior. Until recently, however, no country in Europe squarely faced the problem of making the consular service a commercial one, as it has become in the United States. Several European countries, nevertheless, require candidates for the service to pass an examination or undergo a period of probation before appointment. The author suggests that this plan be introduced in the United States, but he fails to point out the difficulty of its adoption, owing to the constitutional provision requiring officers of the United States to be appointed directly by the President and confirmed by the Senate. Other suggestions of the author for the improvement of the consular service are: (1) Commercial direction and management of the consular reports on the part of the home government, so that the service may be brought into closer

touch with the boards of trade thruout the country, and (2) a permanent corps for the inspection of the service abroad on the same plan as the present inspection of the post office service.

Literary Notes

....*Her Own Way*, the play by Clyde Fitch, in which Maxine Elliott has starred for two years, is now published by Macmillans. (75 cents.)

....A new volume of W. W. Jacobs's amusing stories of old sailors has just been published by Scribners with the title of *Shore Cruises*. ($1.50.) They are delightful yarns to read aloud when a good chorus of laughter is wanted.

....The story of the temptations and snares of Washington life for the innocent and unsophisicated country M. C. is graphically told with cartoons and comment by John T. McCutcheon in *Congressman Pumphrey*. (Bobbs-Merrill.)

....A large number of prominent clergymen testify to the success of *The Gipsy Smith Missions in America* in the volume commemorative of the services held by the famous English evangelist in American cities last autumn. The publishers are the Interdenominational Publishing Co. of Boston.

....Among the spring books which have just appeared from the press of L. C. Page & Co., Boston, the following attract especial attention: C. G. D. Roberts's *Haunters of the Silences*, W. D. McCrackan's *Italian Lakes*, Morley Roberts's *The Flying Cloud* and Sidney Paternoster's *The Lady of the Blue Motor*. Reviews of them will soon be published in THE INDEPENDENT.

....It is a matter for congratulation that housekeeping is fast becoming a science. In time, we hope to see girls trained for the profession most of them will follow. Professors Bevier and Usher, of the University of Illinois, publish a monograph on the history of this new education in domestic science, from its inception in the Western States of Iowa, Kansas and Illinois to the present. (*The Home Economics Movement*). Professor Lucy M. Salmon adds another work, *Progress in the Household* (Houghton, Mifflin & Co., $1.10) to her earlier statistical book, "Domestic Service." More practical to the average housewife, if less interesting to the sociologist, are genuine "cook-books," which may serve as laboratory manuals of the new science, which is still in a chaotic and inchoate condition. *The Making of a Housewife*, by Isabel Gordon Curtis (Frederick A. Stokes Co.) is a sort of kindergarten book for very young cooks. *The Bachelor's Cupboard* (John W. Luce & Co. ($1), on the other hand, furnishes a post-graduate course in cookery of a more elaborate kind, evidently the cuisine preferred by the average man, be he bachelor or benedict.

Pebbles

THE SPARTAN MOTHER.

HOME they brought her darling Fred,
Bruised so bad he couldn't toddle;
But she only smiled and said,
"Freddy's not a mollycoddle."

—*Cleveland Plain Dealer.*

SMITH ET BARBE-VERTE.

From the Flemish of Maurice Maeterlinck.

SCENE—An upper room in Fayerweather. Big, gloomy, dusty cobwebs in all the corners. In the left rear a door leading into a dark corridor. Thru a small window at the right the leaden-green rain beats in pitilessly. It is cold. The Miserere is being chanted in the chapel nearby and the mournful sound comes in thru the window with the rain. A large black poodle trembles lugubriously in a corner. There are a few wooden chairs and some frightened students in the center. A gong in the corridor rings furiously and falls from its fastenings.

First Freshman—I am afraid.

(The professor enters. He wears a suit of pale magenta and has green whiskers, also a young cabbage in his left hand. He places the cabbage in a glass of water. A cloud covers the sky and intense darkness settles upon the room.)

Second Freshman—He has a somber look. I am afraid something terrible is going to happen. Oh! I am sure something terrible is going to happen.

A Sophomore—Oh! oh! what was that?

(Plaster in room turns roquefort-cheese green and drops off in large flakes.)

First Freshman—I am afraid.

(Thunder and lightning outside. The poodle howls miserably. The professor seizes him by the ears and throws him thru the window. Silence, a splash, and silence again. The wind agitates the green whiskers of the professor. He brushes away the whiskers from his mouth and takes out a doughnut from his left-hand trouser's pocket. He nibbles at it.)

Second Freshman—He is very angry. I am sure something terrible is going to happen.

(It commences to hail. Almost incessant thunder and lightning continue to end of scene. The wind overturns the cabbage in its glass.)

Professor—(Addressing the First Freshman in a muffled voice.) I have a question to ask you.—One would call it a complex question.—How much are two times two?

A Sophomore—Oh! Oh!

First Freshman—My God! I have forgot. My God! My God! (He dashes wildly from the room into the corridor and is heard sliding head first down the marble steps. A squashy splash and then silence.—)

A Voice—I fear he has hurt himself. My God! I fear he has hurt himself.

(A black curtain falls suddenly.)

—*The Columbia Jester.*

Editorials

Governor Hughes

By the nomination of Charles E. Hughes for Governor, the Republican party in the State of New York was saved from defeat at last year's election. He represented the protest of the people against the financial and political corruption which had been disclosed by the memorable investigation of the life insurance companies. A study of his career and character, together with an appreciation of his excellent addresses during the campaign, so commended him to the public that he was elected, altho his associates on the ticket were defeated. His attitude in assuming office was that of one representing no party, but standing for all the honest citizens of his great State. As was his duty, he recommended for the consideration of the lawmakers a program of reforms. These included measures for improving the ballot, promoting efficient administration, preventing corruption at elections, satisfying the reasonable demand of his defeated rival for a recount of the votes cast at the Mayoralty election in the city of New York, and regulating justly the affairs and conduct of the great public service corporations.

From the beginning of his term he has encountered formidable opposition at the Capital. Corrupt legislators in both parties, the dislodged and discredited Republican bosses, incompetent and otherwise unworthy officers who feared removal, representatives of public service corporations the regulation of which by strong commissions and just laws he sought, and all who have been accustomed to profit by the purchase of legislation and by machine rule, have combined to defeat his purposes. A test of their strength in the Legislature was delayed until last week. Then, in the case of the Superintendent of Insurance, they were victorious. This Superintendent, who appears not to have been corrupt, had been shown by his own admissions to be incompetent and clearly unfit for his important office. Governor Hughes, having failed to obtain his resignation, recommended that he be removed. The Senate, in which there is a large Republican majority, voted to keep the man in his place. Ten Republicans, led by the worst in their party, stood against the Governor with seventeen Democrats commanded by men notorious for political and legislative jobbery during many years past.

These men, or a large majority of them, were not really solicitous for the welfare of Superintendent Kelsey. Their aim was to overcome an honest Governor, and to make his reform policy ineffective. Kelsey's plight was their first opportunity. Undoubtedly their main purpose is to defeat, or to make worthless, the very important bill for the regulation of public service corporations.

They have been assisted by the Governor's novel but none the less commendable course, which indicates his character and ideals. At the beginning of the session he gave notice that he should in no way interfere with the legislative branch of the State Government. Other Governors, his predecessors, as everybody knows, had bossed the Legislature, making programs of legislation, forcing them to enactment by bargains with leaders in each House, exercising control by rewards and punishments in the form of vetos and approvals, and freely using State and even Federal patronage to accomplish their purposes. Governor Hughes kept his hands out of this dirty work. He would have nothing to do with the organization of the Legislature, and it was organized mainly in hostility to him and his reforms. When the chairman of the Republican State Committee proposed certain men for appointment to office, they were not appointed, for good reasons. This chairman had been powerful under the old conditions of machine rule. Thus the Governor lost the support of what is called "the organization."

He declined to have any "personal representatives" in the Legislature, or to build up a "Hughes party" there or elsewhere. He refused to exert influence upon Senators by means of his power to veto or to approve bills. We are in-

formed that he even declined an offer of such assistance as could be given by a use of Federal offices in his interest, an offer the nature of which was indicated by the removal of Internal Revenue Collector Sanders. He wanted no help of this kind. He was more loyal to the principles of civil service reform than the President himself.

Thus he refused to take advantage of the methods to which the politicians in the Legislature were accustomed and by which in the past many of them had been controlled. They had no more liking for such a man than for his reform projects. And with the aid of those interests to which those projects were extremely distasteful they set out to defeat the purposes of a Governor whose conception of the duties and dignity of his office would not permit him to control them either by corrupt bargain or by the whip.

Now, it seems to us that this is a Governor of ideal excellence, whom the people should delight to honor and support. Upon the people he relies. To them he looks for approval and help. At Elmira, last week, replying without a trace of resentment to an attack upon his corporation policy by a politician who plays the cheap demagog when he is a candidate for public office, but serves the corporations faithfully at other times, he said:

"In distinction from my learned friend, Mr. Stanchfield, I am here under a retainer. I am retained by the people of the State of New York to see that justice is done, and with no disposition to injure any investment, with every desire to give the fullest opportunity to enterprise, and with every purpose to shield and protect every just property interest.

"I stand for the people of New York against extortion, against favoritism, against financial scandal and against everything that goes to corrupt our politics by interference with the freedom of our Legislatures and administrations. I stand for honest government and effective regulation by the State of public service corporations."

What are the people of New York going to do about it? What answer will they give to a man who represents their interests so intelligently and honestly? Will they without a protest permit rascals whom they have placed in the Legislature to kill all his measures for reform and so tie his hands that he cannot have fit agents for the enforcement of even the laws that now exist? Are they to remain silent, or will they in some effective manner rebuke and restrain the Raineses and McCarrens and Gradys at Albany? If they now fail by mass meetings, by telegrams, by personal appeals and in other ways to express their displeasure to legislators who have betrayed them, and to uphold the Governor's hands, they cannot reasonably complain hereafter of the evils which Governor Hughes has earnestly and diligently sought to remove.

The Perversion of the Nobel Fund

We agree with Mr. Lange when he says, on page 1060 of this issue, that Dr. Alfred Nobel was a man of remarkable originality, as is shown by his bequest of his fortune to Scandinavia to reward the benefactors of mankind. But we fear that his originality will never be allowed much scope by those who have charge of the administration of the fund, for they have from the beginning shown a flagrant disregard of the intentions of the founder. This, of course, is no new thing. Many philanthropic testators, if they could rise from their graves fifty or a hundred years after they had been laid in them, would repudiate the work that is being carried on in their names. This is sometimes the fault of the trustees and sometimes their wisdom. The provisions of a will may prove to be impracticable, or in the course of time the changed conditions may make it useless or detrimental to the cause it was intended to promote.

But Nobel's plan has been proved neither unpractical nor unwise, because it has never been tried. In his will of November 27, 1895, he directs that his property

"shall constitute a fund, the interest accruing from which shall be annually awarded in prizes to those persons who shall have contributed most materially to benefit mankind *during the year immediately preceding*"

The clause we have italicized has been disregarded from the start by the five Nobel committees, altho it is the most original and promising feature of the plan. Great discoveries in science and innovations in literature are often the

work of young men, unappreciated by their colleagues and superiors, overburdened by drudgery and inadequately provided with the means of study and research. To men like this the free gift of $40,000 and the public recognition of the value of their work would be a godsend. They would be stimulated to greater exertions and would be able to devote themselves to the work for which they had already proved themselves exceptionally fitted.

But the Nobel committees, instead of this, have chosen to bestow their awards in many cases on men who, long before the Nobel Fund was established, had done the work for which the world is their debtor, and were resting on their laurels. The money, however much needed, will not enable them to do more than they have; the honor, however much deserved, will not add to their fame. The Nobel prizes have been given only six years, yet six of the recipients—Carducci, Moissan, Dunant, Mommsen, Finsen, Curie—have died since they were so honored, three of them from old age. The following table shows how far the Nobel committees have departed from the intention of the founder in rewarding contemporary achievement:

Name.	Achievement.	Age of Achievement.	Age of Award.	Years of Delay.
Dunant	Geneva Convention	36	73	37
Sully-Prudhomme	"Justice"	39	62	23
Mommsen	"History of Rome"	37	85	48
Fischer	Sugar synthesis	33	50	17
Björnson	"Arne"	26	71	45
Mistral	"Mirèio"	29	74	45
Echegaray	"O Locura ó Santidad"	45	71	26
Passy	French Arbitration Society	45	79	34
Arrhenius	Electrolytic theory	25	44	19
Becquerel	Uranium rays	44	51	7
Behring	Diphtheria antitoxin	38	47	9
Ramsay	Helium	43	52	9
Finsen	Light cure	34	41	7
Cremer	Interparliamentary Conference	50	65	15
Rayleigh	Argon	52	62	10
M. Curie	Radium	39	44	5
Madame Curie	Radium	31	36	5
Röntgen	X-rays	50	56	6
Ross	Malaria parasite	40	45	5
Carducci	"Odi Barbare"	44	71	27
Ramon y Cajal	Neurology	41	56	15
Moissan	Isolation of fluorine	35	44	9
Baeyer	Artificial indigo	45	70	25
Koch	Tuberculosis bacillus	41	64	23
Sienkiewicz	"With Fire and Sword"	38	59	21
Lenard	Lenard rays	32	43	11
Suttner	"Die Waffen nieder"	47	63	16
Golgi	Nerve staining	25	58	33

The Code of Statutes of the Nobel Foundation, issued in the name of the King, June 29th, 1900, contains the following section:

"The proviso in the Will to the effect that for the prize competition only such works or inventions shall be eligible as have appeared 'during the preceding year' is to be so understood, that a work or an invention for which a reward under the terms of the Will is contemplated, shall set forth the most modern results of work being done in that of the departments, as defined in the Will, to which it belongs; works or inventions of older standing to be taken into consideration only in case their importance have not been previously demonstrated."

This action loosened up the stringency of the phrase used by Nobel, but the committees have not even kept within the elastic limits that they imposed upon themselves, as a glance at the table shows. What we have put down as the "age of achievement" is the year of the man's life when he produced his first work of superlative importance, the excellence of which was either recognized at once by the world or would have been discernible by a learned and well-equipped body like the Nobel Committee. But in many cases nothing had occurred to "demonstrate the importance" of their achievements during "the preceding year," or even during the time the Nobel Foundation has been in existence. Carducci was too weak to rise from his chair when the emissaries of the Nobel Committee brought him his medal and too feeble in mind to answer them. He had not published a book for nine years, and his position as the foremost of Italian poets had been established for over thirty years. The fame of Sully-Prudhomme, Echegaray and Mistral has declined rather than risen in the last six years, because they have become more historic monuments than leaders of modern thought.

Mr. Lange defends the appropriation of 25 per cent. of the income for administrative expenses on the ground that it is necessary in order to insure that the prizes are worthily bestowed. This might be justifiable if the money were spent for this purpose. If the committees used the laboratories and libraries they have established out of the Nobel Fund for the purpose of testing the real value of alleged inventions it would do much to promote science and assist in the discovery of struggling genius. But

no man is allowed to present his own claims. He must first have the endorsement of scholars occupying certain narrowly specified official positions in his own land.

As a matter of fact, the selections of the Nobel Committees have not been such as required special ability or expenditure for investigation. Any college student in chemistry, physics or medicine, if asked offhand to name the greatest living men in his branch of science would have hit upon at least fifteen out of the twenty-two names on the list of the Nobel prize men. In the choice of those who had done most for the promotion of peace or produced the greatest work in idealistic literature there would have been greater diversity of opinion, but not because the names chosen were not well known. Did it require an $80,000 laboratory to test the reality of the X-rays? How much of the "rather more than $12,000" appropriated for that purpose last year did the committee expend in repeating Baeyer's synthesis of indigo, first made a quarter of a century ago, and now accomplished at the rate of thousands of tons a year? Did the Caroline Medical-Chirurgical Institute of Stockholm have to spend much time in ascertaining that Golgi's method of nerve staining, which has been in common use for over twenty years, is practical and valuable? How large a reference library was needed to discover that Mommsen was a great historian?

The Nobel bequest was reported to be more than $8,000,000. This, if invested in safe securities, as Nobel directed, should produce about $64,000 for each of the five annual prizes. So much of the income has been spent for other purposes, in salaries, traveling expenses, ceremonials and purchase of books and apparatus, that the amount of the money prize has now shrunk to $37,000. And still the local administrators are not satisfied with what they get out of it. Mr. Lange suggests that they may take advantage of the clause allowing them to suspend the award for not longer than four years in the absence of suitable candidates in order to get money for the "constructive" work of the Nobel Peace Institute, for the maintenance of a library and reading-room in Christiania, for a complete catalog of the literature of internationalism, a school, the printing of books and periodicals and the establishment of another arbitration court. These are highly creditable projects, but the Nobel Fund was given for another purpose. All the countries of the world have the same interest in it as Norway and Sweden, and they have a right to protest against its misappropriation.

Bearing with One Another

SOME very grave evils of our times arise from the fact that men and women are losing patience with one another. The more sense they get about everything else the less they appear to have about each other. They want to be exacting of one another according to what is reasonable rather than what is natural. Men seem to have forgotten that however intelligent and capable women are, they are still unreasonable and subject by nature to the moon; and women are equally absurd in their demands for ideality in men. This goes far toward explaining why there are not so many or such ardent lovers among the young people. They lose sight of the main proposition, that it is *love* which is perfect, not themselves. And even when they marry they do not always take one another for better or worse with the same courage lovers once showed. So, if the man proves worthless, if the woman is extravagant, they do not have it out with each other in an old-fashioned tropic of love, known as quarrels, but they keep silent and consult an attorney as to whether they are entitled to a divorce or not. They think this is more dignified than quarreling, but it is not. It is telling the court what they should say only to one another. Besides, marriage never was intended for perfect people, but it is especially designed to make up the deficiencies in two imperfect people. It is a means secured to them in spite of their abominable faults and irritating limitations by which they may achieve some dignity and worth in the sum of things.

But look what we have instead of this ideal relationship—old bachelors with

their snarling cynicism about women, sorry creatures too mean to propagate themselves; old maids whose desolation is pathetic, and innumerable divorced people whose condition is worse than unfortunate. Nature makes no provision for any of them, except the provision of decay. In this way their dust may be used later on for better purposes.

And we are told that all this trouble grows out of certain bad economic conditions. And this seems likely when we consider that naturally men and women like each other, and are obliged to go against the strongest instincts to keep apart. But how did we come by such conditions? Apparently this modern coolness between them began about fifty years ago, when women discovered that men had insulted them by making them the house cats of civilization. And that was wrong, of course, but men never know any better about anything till women teach them. So what is the use of rubbing it in? The important question now is how to relieve this strained relation and thus insure more courtships and marriages during the coming love season.

For one thing, they should think less of their mutual wrongs and more of their peculiar indebtedness to each other. Women, for example, are under many more obligations to men than they are to their own sex. They are a great care over and above anything they can do for themselves. And every one of them is at times a nuisance. When they remain in their natural sphere of home-making and child-bearing they are self-supporting in the sense that they do the most important work in the world for what they can give, not for what they can get. But in many ways they are dangerous and difficult during the first twenty years of this period. The sweetheart changes into the wife more than she ought to change, and the wife changes still more into the mother. She usually creates a home better suited to feminine taste and to the needs of her children than to those of her husband. The average home is simply a grown up doll house, often belittling to the natural hardihood of the man.

And when women get out of their natural sphere, allowances are made for them on all sides by men. Intellectually they are humored with everything, from giving them diplomas from male colleges to the acceptance of their theories about ethics and politics. Industrially they have complicated the situation in a hundred ways and have no conscience about pauperizing man by taking his job at half price. This is an injustice he would never bear from another man. But it is no wonder that he sulks and does not want to make love to her nor to marry her. Yet, upon reflection, it is the easiest and only way to get rid of her. Indeed, if we adopted the immediate, pragmatic method of solving such problems, we should hear less about economic conditions and more about the proper nourishment and education of children.

But if woman has been a worry and a care to man, what shall we say of the devotion and persistence with which she has egged him up in the scale of things? There was some talk about the injurious influence of the first woman, to be sure, but it was doubtless exaggerated at the time, and certainly it has been ever since. Nothing is easier than for a woman to lead a man astray, because he has so many predilections in that direction that even her best endeavors do not always serve to keep him straight. And it is not too much to say that she is a good part of the leaven of all the righteousness he has ever acquired. Besides, she is the only creature in the world who knows how really weak and stupid he is and never tells.

And passing over the graver aspects of her influence, her patience with him in so simple a matter as his personal habits is worth considering. The average man, not to say almost any man, would revert to the savage state at this point long before he did morally or intellectually if it were not for his womankind. It requires constant nagging on her part to keep the most excellent men from becoming social and domestic barbarians. Recall Mommsen. Mrs. Mommsen represented a much higher state of civilization. He was her great man and her pig. She fed and attended to him as if he had been an idiot or a savage. Nothing is so slight an evidence of a man's position in the scale of things as that he is a great historian and philosopher. He may be a stupid creature with merely a bril-

liant mind dressed like a man. Only the women who have to deal with him know, and it is to their eternal credit that they never despair of his evolution. Possibly if they were more intelligent themselves they would despair. As it is, they go on, generation after generation, teaching him manners and decencies and a few other things that have improved him more than all the grand thinking he has ever done.

All these things and many others prove how necessary men and women are to each other. Apart, they are either mean or meaningless. They do not count for enough hereafter, even when they have composed a dictionary or aggravated the world with a new system of philosophy. And so they should forgive each other these mighty differences of opinions, marry and be given in marriage for the good of the race. Then the children who come after them will count for more than any kind of opinion.

Suicides

We have too many suicides, more than can be reasonably accounted for. We may expect a certain number, which will have no ethical or sociological importance—only pathologic; cases of temporary insanity, such as when a man in a fever jumps out of a window. But the number of cold-blooded suicides seems to show an alarming increase, suicides of persons in sound health, simply disappointed or weary of life. Even boys and girls kill themselves merely because they have failed at a school examination or been blamed by their parents.

The latest, apparently most unreasonable, is that of Dean Huffcut, of Cornell University. He was a man in the prime of life, in good health, harassed with no financial and family anxiety, most highly honored, with brightest prospects of success and advancement. He was at the head of the Law Department of the University, one of the most brilliant of its scholars and speakers, and was giving his sabbatical year to the pleasant and most honorable task of assisting and advising Governor Hughes in his work of legislative reform. He could have wished no better prospect before him, for he could have sought any promotion he desired. Just at this most propitious period in his career he suddenly shot himself, and with full deliberation. We give herewith his letter to his sister in full, for it has its lessons:

"Dear Sister: I left for Ithaca tonight, but decided to take my body down to you in New York in order that it might be cremated. You will attend to that for me. If you have any difficulty call on my old friend De L. who will assist you.

"I am going down the river and enjoying the prospects of going out to sea. The ashes I leave behind may be disposed of at present as the others prefer, but eventually you will take them to Eastlawn. And do not permit any public services of any sort anywhere. If the immediate family want private services in B. [Binghamton, Dean Huffcut's home town], let it be soon, but have no one else.

"I was never so glad to rest in my life. We must be quiet and live so. I've been thinking all the way down the river of some one's lines:

"Sweet after toil is sleep; then wherefore sorrow
For him who sleeps and will not wake tomorrow?

"Good-by. I don't want you or any of the others to be troubled about this. I've really postponed it often on account of others, but this time I am doing it. After all, in the end, one must have his own way of escape.

"You must stay and do what is necessary. Affectionately. 'Ernest.'"

That is not the letter of an insane man. He had been at work day after day with Governor Hughes, with no loss of legal shrewdness and wisdom. The Governor had seen no sign of insanity in him. He says he had been thinking of it a long time, and it was a matter of deliberation. He was simply tired of work and wanted to get rid of it. So it was pleasant to him to think that he was sailing down the river and going out to sea. For others' sake he had delayed it, but would now delay no longer. He would rest—the long rest.

Does that seem to most of us a most unnatural feeling, in view of the natural love of life? Must we allow that the love of life can somehow be educated out of us?

We do not know what was Dean Huffcut's thought of the life beyond the grave except as this letter tells us; but from that letter we may gather something. There is no thought of anything beyond the grave. Death is to him nothing but a "way of escape," and each may take "his own." After this sleep there is nothing beyond "for him who sleeps and will

not wake tomorrow." It would seem as if he had quite educated himself out of the hope or plan of a life beyond. This life was all, and after that only dreamless sleep. Why, then, should not one who, when weary of a day's toil, lies down to pleasant slumber, take a longer sleep when a little more weary and tired of the toil of life?

We fear there are many who are thus losing their hold on the faith of the life to come, and a most unfortunate loss it is for them and would be for the world. That faith holds us to life and service. It makes one stand by the lot in which he has been placed by the Maker he believes in, and not hasten uncalled into the Eternal Presence. To be sure, there are moral obligations resting on the Positivist who believes there is no God and no future life, for he should live for Humanity, his God. It is wrong for one to say, even so, that he can take his "own way" to end his life, for altruism demands that he should give his full service, even weary, to his fellow-men. We do not excuse Dean Huffcut for his retreat in the battle, even if he were weary; but we do see what a buttress to strength and courage has been removed when faith is lost. So we say that no better service can be given to the family of man than to make clear the reason for assurance that God reigns, that all is therefore well with the world, and that man is something more than a mere digestive tract and a cerebro-spinal system.

And let us add one other not insignificant lesson. Dean Huffcut was forty-two years old, and was unmarried. We can hardly imagine that if he had had a wife and children depending upon him he would have been so cruel as well as so cowardly as to leave them and lie down and die just because he was weary. Even beasts will toil for their young. The man who marries and has children has given pledges to fortune. He has something to work for, something that makes toil sweet. His home is a rest and delight to him. The unmarried, homeless man may possibly excuse to himself his discouragement and weariness of the endless, fruitless task, because he has denied himself the chief satisfaction of life, as well as the chief steadying spur of effort and its chief reward. We are sorry that Dean Hoffcut, learned man as he was in the law, had not learned and obeyed this high law of our social economy, that we must live in families; and still more are we sorry if he had lost his vision of the bow which spans the earth, but which arches the heavens.

Two Colonial Policies

It is a very serious condition which England is approaching in the control of its colonial possessions, particularly in Egypt and India. We have had warnings given to the United States that we know nothing about governing dependencies, and might learn much from the success of England in governing India and Egypt. There have been books written to show how scientifically England and Holland and France do this thing, and that it is a great mistake for the United States to imagine that it can carry its theory of self-government to the Philippines and expect to succeed by an entirely different policy from that which has produced such excellent results in the hands of famous European administrators.

But the American system, tho quite untried and novel, was accepted by us. We announced from the first that in Hawaii all the people should rule. In Porto Rico we established a lower house of an insular legislature, in preparation for fuller self-government. In the Philippines we announced, before we had been five years in control, that the Philippine people should take their part in making and executing the laws. We have set the time when the first election to a representative house shall be chosen; and this is the promise of all the self-government the people can maintain. That is our way, our theory, and utterly different from the theory of all other countries, even of Great Britain. The two must be tested. They have claimed that the European way has been tested and has succeeded, while ours must, in the light of experience, be a failure.

But now there is danger all around the circle. While the reports from the Philippines are favorable to quiet elections, those from India and Egypt grow more alarming. Lord Cromer has resigned at the psychological moment, and another

hand holds the rod over the Khedive and the people. The native press frets and scolds, and we are told now and then how the hatred of the fellahin for the British breaks out in attacks which require bloody punishment. Egypt asks for the right of self-government, while Britain gives it not a particle thereof.

In India the condition is more alarming, for it is a large country, and not so easily policed and controlled, while the foci of flame are more numerous and dangerous. The people are being educated, and education brings its peril. The missionary schools first gave it because it was right, and with no consideration of the political effect. Then the Government, out of pure shame, added more schools, perfected the system, with utter disregard to the certain effect—for you cannot keep a people in submission to arbitrary power except they be ignorant. In slavery times that was understood, and it was a crime to teach slaves to read. As the Hindus are educated in Western ways they want Western liberty. For a series of years there has been an annual Hindu Congress in India, at which plans for national development have been discussed, and all with a view to relief from British domination. Of late, following the unpopular division of Bengal into two provinces, a bitter feeling has arisen which has resulted in the *Suadeshi* movement, to boycott all British productions. The latest news gives us many accounts of riots against the British, or between the Hindus and the Mohammedans, who support the British because they hate them less than they do their fellow countrymen. The Japanese success has encouraged Asiatics to believe that they are competent to rule themselves, and the memory of the Sepoy Rebellion is yet fresh.

It may be, after all, that the vaunted wisdom of colonialism has been overrated, and that it may turn out that it belongs to a crude statesmanship fitted to an age of illiteracy, and that the truer statesmanship is that which trusts people with liberty; that kind of statesmanship which has just now given self-government to the Transvaal, and which we may hope for from the present Liberal Government of Great Britain in its control of its possessions in Egypt and India. We were laughed at for our sanguine policy in the Philippines, but he laughs best who laughs last. A great principle, like that of liberty, justifies itself in the end.

The Dominican Treaty

After long delay the treaty negotiated between the United States and San Domingo, for the collection of the Dominican customs and the settlement of the Dominican debts, has been ratified by the Dominican Congress. We have been acting under it, and have been collecting and depositing the customs, and can now use them to pay the obligations. This means that the United States will collect the customs for at least twenty years, until the bonds are paid, and will give over to the Dominican Government what is needed for its support. Our Government has the right to protect the collection of the customs, and so it protects the seaports, and, in fact, polices the Dominican half of the Island. This gives us a practical protectorate, such as we have over Cuba for the present. We are looking at this matter of control of the West Indian Islands quite differently from what we were in General Grant's administration, when we rejected the treaty which the President had negotiated to give us Samana Bay, and which Senator Sumner got so hot over. Now it looks as if all the islands were coming to us, for all of any size except Jamaica are now under our control, and Jamaica is a burden to Great Britain, as are the Danish Islands to Denmark. Whether these islands shall ultimately be admitted with equal State rights into the Union is a question for the future to decide. We regret to observe that ex-President Andrew D. White is strenuously opposed to the thought, believing that the Cubans cannot possibly be fitted for taking part in governing a nation of which they and we shall be a part. We have more faith in human nature, even that of Cubans; and we back the demand of Porto Rico to be made a full Territory, with ultimate aspirations to statehood.

The Cornell Kids

Some of the masculine students of Cornell want to expel the women from the university, and propose as a first step to exclude them from class organizations and all student activities,

We remember that once in a Western college some years ago a green Freshman who had just been elected president of his class proposed the same thing. There was a large and hilarious mass meeting held that night, a masculine mass meeting in which every man in the college took part. The recreant president was duly tried, condemned and hanged; he was not present in person, however, as he had taken the early evening train for parts unknown. Such an outrage on the right of freedom of speech and opinion was entirely unjustifiable. Still we would have thought better of Cornell if the proposition had been received in the same spirit there. We would remind the young fellows who took part in the recent anti-feminine demonstration that there are some "segregated" institutions in the State of New York for which they are better adapted than Cornell. A four years' course in the Elmira Reformatory might instil into them some elementary ideas of decency and manhood. We see that a professor of French took a prominent part in the proceedings. We trust he is a better teacher of the French language than he is of French courtesy. The women who have been graduated from Cornell have done as much honor to it as the men, and they have the same right there. Let it be remembered that Cornell University is no private perquisite, but that the bulk of its support has come from the United States Government and the State of New York. It was chartered to create an institution "where any person can learn anything."

Imported Socialism

We make no definite war on Socialism, for we admit that more of it is needed, and we would begin with the Postal Express. But we draw the line on the Socialism that means Anarchism and violence. We have before us "the organ of the Socialist Party," published in this city, and which calls itself *The Worker*. Just now its main task is to raise money to save the two men, Moyer and Haywood, on trial for the murder of Governor Steunenberg. It is in their behalf that there were got up great "Labor" parades for May 1st and 4th. These parades, it says, relate to "the persecution, miscalled prosecution, of the officers of the Western Federation of Miners, the exposure of the capitalist conspiracy to terrorize organized labor by the use of the gallows." We are interested at present in the composition of these parades, almost wholly foreign, made up of those who have learned their lessons of political violence so largely in Russia and the outlying provinces. The "Socialist" clubs are numerous — Lettish, Hungarian, Polish, Semitische and Russian—under various names. There are a multitude of radical "unions" and "associations" with strange names—Scheftlisticker, Ekaterinaslav, Krawkaser, Retchilzer, Dveusker, Kischeneff, Cheniguar, Novazipkover, Tinkowitzer, Kidanora Yarover, Kartary Bereza, Halopnitzer—and so on for nearly two long columns. There are a multitude of them and they made a great parade, but their children will know our institutions better.

Is It True?

When one reads the brilliant article in this week's issue by H. G. Wells, there is just one question which the reader must ask, Is it true? Is it a fact, in his own case, in the case of those of his class about him, that he, one of the "middle class," is "in a state of increasing financial worry and distress, irritated, depressed and broken in courage?" Is he conscious of that feeling; does he observe it generally in his neighbors? Is he getting more or is he getting less of the comforts and satisfactions of life? Does he, or does he not see, if he lives in or near one of these "congested" cities, miles of comfortable, middle-class homes, the dwellers in which are not aware that they are ground fine between the upper and nether millstones, and who live cheerful, self-respecting lives? Is it true, or not true, that more of this middle class are owning their own homes, and that those who have had the courage to assume responsibilities therefor are paying off their mortgages? Does the Census substantiate any such representation of the people "drifting helplessly into debt"? If conditions are as stated in this article, then let the reader follow on to the conclusion of the article; if they are not, and if he sees the men and women about him cheerful and buoyant, then let him hold to his courage and believe that we are

moving, thru steady development, in a right direction toward the general betterment and bestment of the social state.

The Exposition

There is nothing yet to be said about the Jamestown Exposition itself, for altho it has been formally opened, there is no exposition ready as yet. Those who want to see an exposition should wait until it is somewhat more advanced. Everything is congested. There were at the time set for the opening quantities of unloaded cars, whose contents people were not able to get at. Even the Government exhibits were making a bluff of being ready, when hardly half the things are installed, and theirs are the only buildings that have anything to show; the others were either empty or yet in the process of construction; electric wiring not done. The lagoons had no water; the great pier and boardwalk were still being built; no flower beds set out; walks and roadways yet to be put in order, and railroad tracks cleared away. Really everything has looked shiftless, and as for transportation, it has been a farce. Boats do not pay attention to their schedule and trolleys break down. Meanwhile we are told that money is lacking to finish the work which ought to have been well done. Nevertheless, order may come out of confusion, and there are lilacs and dogwoods and acres of strawberries in bloom, and nature is doing her best to make amends for the negligence of man. The Exposition has a glorious water front, and will have many lovely features should it be finished before the hot summer suns dry up everything.

Quoting from THE INDEPENDENT extracts from Senator Bailey's virulent speech against his enemies before the Texas Legislature *The Northwestern Advocate* recalls the advice of Abraham Lincoln to an angry man that he write a letter expressing his feelings, which he did:

"It bristled with flame. Then he spoke about sending the letter. 'Oh, you are not going to do that,' said Mr. Lincoln, 'Now that you have expressed your feelings, tear up the letter. It would not be wise to send it.'"

A more apt story is that of the Rev. Newman Hall. He wrote a savage pamphlet in answer to one who had criticized him, and he read it to a valued ministerial friend, who praised it highly, and added, "Have you thought of a title? Much depends on a title." Newman Hall admitted that he had not, when his friend suggested as a title "Go to the Devil; by the Author of 'Come to Jesus.'" The pamphlet was not printed.

While General Kuroki, who commanded the first Japanese army during the war with Russia, is on his way to visit the Jamestown Exposition and the country as well, we may mention, for the benefit of those who have read a late pronouncement of certain English physicians, his experience with alcoholic beverages during the war. His division fought fifty battles in twenty months, including the first of the great battles on the Yalu. He sent out this drastic order: "If any man gets drunk while on duty he will be shot to death." Then followed the most drastic regulation. Not a drop of sake or other liquor was allowed to be sold to officer or soldier. It was excluded even from the hospitals, and nevertheless the percentage of deaths was but 1 per cent. We see that the leading British physicians have pronounced strongly against those members who declared for alcohol.

We went beyond the facts in saying, in a late issue, that the proposed Oklahoma Constitution would exclude from the right of suffrage such men as General Howard and Admiral Dewey. While it excludes a member of the Army or Navy from the ballot, altho a resident of the State, it provides that he may recover his right after retiring from the service. The provision is not quite so bad as we understood it to be.

There have been lately one or two cases in which clergymen have run away from their wives with other women, and they make fine sensations. There is no new moral to be drawn from these cases. They are older than Paris and Helen, and the ranks of the clergy have of old included knaves and fools. So we need add nothing to the old lesson.

Insurance

The Suicide Clause in Life Policies

THE Missouri law permitting recovery of the face of an insurance policy in case of suicide, irrespective of any clause antagonistic to this, has recently been upheld by the Supreme Court, which reversed the lower court decisions in this regard. Judgment has been rendered for $5,000 in favor of Amanda M. S. Whitfield and against the Aetna Life Insurance Company of Hartford, Conn. The policy which formed the basis of the suit was taken out by James Whitfield, sporting editor of the Kansas City *Star*, who committed suicide in 1902. Five hundred dollars was tendered the widow in accordance with the policy stipulation limiting payment to one-tenth of the whole policy in case of suicide. This tender was declined by her, and her suit for the full sum is now terminated in her favor. Justice Harlan, who wrote the opinion, held the lower courts to be in error in contending that the law was an interference with the power of contract and against public policy because it encouraged suicide. He said that the law which forbade any insurance company doing business in Missouri using suicide as a defense, unless it were shown that the insured contemplated suicide at the time the policy was issued, was a legitimate exercise of power by the State, and that the limitation fixed by the policy was an attempt to evade its provisions.

It was not, he declared, an interference with the freedom of contract, because the insurance company was not compelled to enter into such contracts, and he found nothing inconsistent with public policy or public morality in the claim that it offered a premium or bounty on suicide, for the reason that the companies would be relieved of liability in cases where it was shown that the insured contemplated suicide at the time the policy was issued.

United States Senator Morgan G. Bulkley, president of the Aetna Life, in a published interview, stated that the judgment would be paid by his company.

Death Rates in Ten Cities

THE table given below is derived from the figures of mortality rates in 1906 of ten of the leading cities in the United States, as recently presented in a bulletin of the Health Department of Chicago:

Cities.	Population.	Rates per 1,000.
Chicago	2,049,185	14.18
Buffalo	410,419	14.96
St. Louis	649,320	15.28
Cleveland	446,996	16.45
Boston	628,344	18.16
Philadelphia	1,441,735	18.99
New York	3,995,076	19.08
Baltimore	553,669	19.42
Pittsburg	368,470	19.85
Cincinnati	358,464	20.07

Detroit, with a population of 335,535, had a death rate of 19.61. The death rate for Washington, D. C., with a population of 307,716, was a trifle higher, being 20.53. New Orleans, with a population of 314,416, presented the least desirable conditions, from the fact that its death rate was 21.71, possibly due, in part, at least, to its system of surface drainage. Among cities with a population of more than 300,000 only Milwaukee, with a population of 338,200, had a lower death rate than Chicago. The Milwaukee figures were 13.69.

NAVIGATION on the Great Lakes for the present season has now opened. Ice blockades on the St. Mary's River have interfered seriously with the movements of certain vessels, but the summer schedules are now being approached. Shipments to date as compared with the corresponding period of 1906 show a considerable falling off in tonnage, the difference being approximately 1,500,000 tons. The outlook is favorable, however, notwithstanding the present congestion at Duluth caused by the arrival there of about seventy coal-laden vessels carrying some 500,000 tons of coal. The capacity of the unloading docks is totally inadequate. Competition for marine insurance business promises to be brisk from now on.

Financial

The Rise of Prices

In a bulletin of 420 pages the Bureau of Labor shows the course of wholesale prices in 1906 and since 1890. For this inquiry, 258 representative commodities were selected—clothing, farm products, foods, fuel, metals, implements, lumber, building materials, drugs, house-furnishing goods, etc. The conclusions established by the tables and the investigation are that wholesale prices, if the 258 commodities be considered as a whole, were higher in 1906 than at any other time in the period of seventeen years covered by the bureau's statistics; that the average in 1906 was higher than the average in 1905 by 5.6 per cent., higher than the average in 1897 by 36.5 per cent., and higher by 22.4 per cent. than the average for the ten years 1890-1899. Diagrams show a continuous fall from 1890 to 1897, a sharp rise in the ensuing three years, a slight recession in 1901, and then a resumption of the advance, which is sharp again in 1905 and 1906. The bureau makes no attempt to point out causes of either rise or fall. Its tables end with December last, and it is shown that the highest level was reached in that month, December's average exceeding by 4 per cent. the average of the entire year 1906. We may add that other and unofficial records show an advance since December. According to the index number of *Bradstreet's*, prices reached a new high level on February 1. This index number, based upon carefully selected classes of commodities, shows an average increase of 18 per cent. since July, 1904, and 54 per cent. since July, 1897.

The Steel Report

Much weight is given to the reports of the Steel Corporation as indicating the condition of business. It was shown at the regular quarterly meeting of the directors, last week, that the quarter ending with March was the best first quarter in the company's history, the net earning's amounting to $39,122,492. This was a little less than the earnings of the December quarter (and a decline in the first quarter of the year is usually expected), but it exceeds the earnings of the corresponding quarter of 1906 by $2,500,000. Unfilled orders on hand March 31st were 8,043,858 tons. Here was an expected and customary decline since December, but the total exceeded that of March, 1906, by more than 1,000,000 tons. It is estimated that floods at Pittsburg and in the vicinity reduced the quarter's earnings by $1,500,000. All the plants are reported to be running now at their full capacity. President W. E. Corey and the other officers were re-elected.

....A dam is to be built across the Connecticut River five miles below Brattleboro, for the development of electric power. The plans provide for the production of 6,000 horse power per day of twenty-four hours.

....In their monthly bulletin concerning investments, Fisk & Robinson discuss the growing ease in the money markets of the world, and express the opinion that the real dominant factor in the decline of security values here was the culmination of the prolonged and world-wide demand for money in excess of the available supply.

....Ten years ago, London municipal 2½ per cent. bonds were sold at par. A year and a half ago, 3 per cents. were sold at 92. For the 3 per cent. rate 3½ per cent. has now been substituted, but an issue of 3½ per cents. a few weeks ago brought only 97. New York City 3½ per cents. were sold in 1901 at about 101½, but the price obtained for the latest issue, at the increased rate of 4 per cent., was only a shade above par.

....At the annual meeting of the New York Chamber of Commerce, last week, Morris K. Jesup, who has been president for eight years, resigned, owing to impaired health, and J. Edward Simmons was elected in his place by unanimous vote. The Chamber adopted resolutions expressing regret that Mr. Jesup had declined a renomination. In a brief address, Mr. Jesup commended George Wilson, who has served as secretary for forty-nine years. At his suggestion the Chamber by resolution extended its sympathy to Alexander E. Orr, formerly president, who has been ill for some time. The Chamber is now 149 years old.

Survey of the World

Secretary Taft's Candidacy

In the field of national politics, the most significant event of last week was the withdrawal of opposition in Ohio to the nomination of Secretary Taft. On the 8th there was a complete and voluntary surrender of those politicians who have been regarded as the friends and supporters of Senator Foraker. The Senator himself joined them in this action. The first to speak was Walter W. Brown, chairman of the Republican State Committee. He gave notice that a meeting of the members of the committee and of other prominent Republicans would be held on the 15th. Having said that the holding of a primary (as suggested by Senator Foraker) had been definitely abandoned, he continued:

"Since the State Convention in 1905, over which Secretary Taft presided as chairman, I have believed him to be the logical choice of the Republicans of Ohio for the Presidency in 1908, and I heartily favor the movement to secure for him an unequivocal indorsement at this time. In my judgment, the meeting of party leaders and joint committees next week will result in a unanimous expression in favor of Secretary Taft."

Mr. Brown has been the right-hand man of Senator Dick, who has been regarded as an ally of Senator Foraker. On the same day, George B. Cox, of Cincinnati, published a statement, in which, after arguing in favor of a settlement of all factional differences, he said:

"We must carry the Legislature next year to elect a United States Senator and get much needed legislation. To achieve this we should support W. H. Taft for President, J. B. Foraker for Senator and A. L. Harris for Governor."

Mr. Cox has been called the boss of Cincinnati. In an address at Akron, two years ago, Secretary Taft attacked him and his methods, and in the ensuing election Cox's ticket was defeated. On the night of the 8th, Senator Foraker's attention was directed to Mr. Cox's remarks, and he said:

"He makes a specific recommendation as to what the action of the Republicans of Ohio shall be in the convention of next year. I do not want any political honors at their hands except with their hearty indorsement. Therefore, if what Mr. Cox suggests and recommends should meet with their approval, no one will support Secretary Taft more cordially than I shall."

It is understood that no concessions or bargains were made by the Secretary or his friends. Overtures to him in the interest of the Senator's renomination are said to have been rejected. Apparently the opposition collapsed because a great majority of the Ohio Republicans desired to support the Secretary. The President is greatly pleased, seeing that the Secretary will now have the solid support of his own State. It is said that Mr. Taft's strength will be tested in many other States without delay, and that there will be an attempt to transfer to him the support of those who think the President should have another term. There is talk in Washington of a "Taft and Hughes" ticket. Reports have been published that a coolness toward Governor Hughes is observed at the White House, owing to the Governor's failure to approve thankfully the recent removal of Collector Sanders, which was designed to assist him. Some say that with respect to this matter the Governor's wishes were mis-

represented by one of his influential friends. In a public address on the 11th, the Governor warmly commended the President, and said that in his labors to secure important legislation he desired to receive the support of all who had the interests of his State at heart. The nomination of Secretary Taft is openly opposed by the Protective Tariff League, owing to "his strenuous advocacy of free trade in Philippine products," his "persistence in the matter of purchasing in foreign markets materials and supplies for the Panama Canal," and "his speech in Maine, in which he pronounced for an immediate revision downward of the Dingley tariff."——On the night of the 12th Senator Foraker changed his attitude toward the coming conference and published a long statement, in which he declined to regard as binding upon himself or his friends any action that might be taken at its sessions.

Prosecution of Trusts

The Government's victory in the proceedings against the Drug Trust was shown at Indianapolis, on the 9th, by a decree of the Circuit Court perpetually enjoining the 92 defendants from using the various contracts, blacklists and other devices by which they have sought to control the retail prices of proprietary articles and other medicinal preparations. To the issuing of this decree the defendants consented. They are officers of the wholesale, retail and proprietary associations. In the decree the blacklists, contracts, price schedules, publications and other instruments designed to prevent the cutting of prices are all enumerated, and the injunction is specifically applied to each of them. The defendants were accused of violating the Sherman act, and the proceedings grew out of the successful suit of C. G. A. Loder, a blacklisted Philadelphia druggist, against the combination.——It is announced by authority that the Government will soon proceed against the Harvester Trust, which is capitalized at $120,000,000, and controls nine-tenths of the supply of harvesting machinery. An investigation has been made under a resolution of Congress.——It is reported also that the Department of Justice will bring suit against an alleged combination of the manufacturers of watches. Complaint is made that, owing to the maintenance of prices here by agreement, American retailers are compelled to pay from 35 to 65 per cent. more for the watches than the prices at which the same goods are sold to buyers in foreign countries.—— In Toledo, O., the brick dealers and lumber dealers recently indicted for violation of the State's Anti-Trust law have entered pleas of guilty, and the lumber dealers have asked for the mercy of the court.——It is said that the Du Pont Powder Company, sometimes called the Powder Trust, will be made a defendant in a Government suit. This is the company in which Senator Du Pont is interested.

Railway Questions

The Interstate Commerce Commission's reduction of the rate charged by the United States Express Company for the transportation of cut flowers from points in New Jersey to New York City is the first that has been ordered under the provisions of the new Railroad Rate law. Following an increase, in July last, of the rate from 50 cents to $1 per hundred weight, complaint was made to the Commission by the florists of the city. It is now ordered that the rate, which is held to be unreasonable and unjust, shall be reduced to 60 cents. At the hearing it was shown that of the entire gross receipts of the company (whose president is Senator Platt) nearly half was paid to the railroads, the Lackawanna taking 45 per cent., the Jersey Central 43 per cent. and the Lehigh 40 per cent. of the receipts for goods carried on their respective lines.——At New York, the Rock Island, Ontario & Western and St. Paul railroads and the Western Transit Company have been indicted for paying rebates in violation of the Elkins law. ——The Pennsylvania Railroad Company publishes a report showing that under the two-cent law of Ohio, while the number of passengers carried in the last year on the Cleveland & Marietta road increased by 13½ per cent. the receipts were less by $4,399. It may become necessary, in the opinion of officers of the company, to reduce the number of passenger trains on that line.——At last week's meeting of the Union Pacific

board, Vice-president Kruttschnitt reported that in the month of February 449 broken rails were found on the company's lines, and that 179 of these were ninety-pound rails laid within six months. To avoid Bessemer rails, the company has given to the mills of the Tennessee Coal & Iron Company on order for 150,000 tons to be made by the open-hearth process. The manufacturers of rails have appointed a committee of experts to act with a similar committee of the American Railway Association in an examination of the methods of production. Chairman Gary, of the Steel Corporation, says the railroads order and use rails that are too light for the rolling stock and traffic. On the other hand, several prominent railway officers assert that in recent years the roads have been at the mercy of the manufacturers and have been compelled to take what was offered, being unable to enforce compliance with their specifications. It is the expressed opinion of some of these officers that a suppression of competition in production has caused a decline in quality, and removal of the tariff duty is suggested.

Labor Disputes

In San Francisco, the street railway men, iron workers, telephone operators, laundry workmen and the employees in several other branches of industry have been on strike for about a week. As a rule, the demands are for less hours and additional wages. The street railway men asked for eight hours and $3 a day. On the 7th, when the company attempted to use two or three cars manned by strike breakers and armed guards, a riot took place. The men on the cars were attacked by a mob. A dozen persons were shot by the guards, one was killed, and it is said that two or three of the wounded have fatal injuries. On following days the company gradually increased the number of cars in service, until, on the 12th, fifty were in use for seven hours. Probably the strikers will be defeated, for the company says it has nearly enough new men to fill their places. The strike of the iron workers led Charles M. Schwab, who was in the city, to publish a statement about losses at the shipyards in which he is interested. His company, he says, will never take another contract for a ship to be built at San Francisco until there is a change for the better in labor conditions there. It lost $2,500,000, he adds, on three battleships constructed in that city, and this loss was due mainly to labor controversies.

Cuba

Governor Magoon has issued a decree for the taking of a census. The completion of this census will be followed by municipal elections. Careful provision is made in the decree for an honest enumeration. Officers who make false returns, and those who give them false statements, may be punished by both fine and imprisonment.——General José Miguel Gomez and Senator Zayas, rival candidates of the Liberal party for the Presidential nomination, together with many other prominent Liberals, ask Governor Magoon to remove the present provincial Governors and Councils, and to appoint in their places American Supervisors empowered to perform all their duties. The petitioners assert that these Governors and a majority of the members of the Councils were elected by fraud.——A plan for expending $4,500,000 of the surplus during the coming twelve months in the construction of roads has been approved.

Mexico's Quarrel with Guatemala

Ambassador Creel said, in Washington, on the 10th, that the differences between Mexico and Guatemala had been satisfactorily adjusted. At the same time, however, it was reported that the movement of Mexican troops to the border had not been checked. Dispatches from Mexico say that the Government decided that it would not insist upon the extradition of General Lima (accused of having procured the assassination of ex-President Barillas in Mexico City), but would publish the evidence against Lima and withdraw its Minister from Guatemala, leaving a consul in charge of the legation. According to published interviews, Señor Limantour, Mexico's Minister of Finance, says that his Government will strive earnestly to avoid war, having no desire to add Guatemala to its territory.

The people of that country, he remarks, could be managed only with great difficulty. Conditions prevailing there now, he asserts, are a disgrace to civilization. By Americans who recently arrived from Guatemala at Honduran ports it is asserted that the political opponents of President Cabrera have been punished with great cruelty. One of them is said to have perished while tied to a stake in the middle of a hill of poisonous ants. It is also said that José Olivera, a rich planter, and his family of nine persons, were killed by soldiers under an order from the Government. It appears to be expected in Mexico that Cabrera will soon be overthrown by revolutionists led by General Salvador Toledo and assisted by Nicaragua. Toledo is said to be at Managua, in conference with President Zelaya, and planning an expedition against Cabrera by way of Honduras. ——In a statement addressed to the American people and given to a correspondent of the New York *Herald*, President Diaz explains the attitude of his Government and virtually suggests to the United States a joint protectorate over all the Central American republics. Mexico, he says, altho almost forced into war, has still maintained the attitude of a friendly power:

"We do not want to shed blood to show the Guatemalan Government the error of its ways and will not resort to that extreme measure unless some overt act or insult is committed which will demand the infliction by Mexico of a short, sharp punishment. If it becomes necessary to have war we will make it a very brief one. Mexico's present wonderful development and progress must not be hindered by a long-drawn-out conflict. The blow, if struck, will be hard and quick."

Having given a brief account of the controversy over the assassination of Barillas and Mexico's request for the extradition of General Lima, he continues as follows:

"Rather than settle the matter with bloodshed, Mexico has withdrawn her Minister to the Central American nations from Guatemala and transferred him to Salvador, not with the idea of severing diplomatic relations with that country, but to get him out of the way of receiving any insult from that Government which would compel Mexico to administer a deserved punishment by force of arms. There the matter rests for the time. That is why there is no war.

"It is only a temporary condition, however. The problem of the Central American republics is a great one that, for the benefit of their salvation, must be settled sooner or later. It is none of my business and I am not ambitious to settle it. Nevertheless, I have an idea. I believe the best solution would be an amalgamation of all the Central American countries into one strong government under a man with enough strength of character and honest common sense to hold in check the revolutionary spirit that has done so much to retard the progress and development of these countries.

"Mexico is willing at any time to co-operate with the United States in a protectorate over them and in any measures that will be beneficial. I do not know the feeling of your Government in this matter, but I assure you I stand ready to work with it.

"I want it distinctly understood, however, that there must be no thought or act of territorial acquisition in this compact. Mexico wants no addition. It is big enough now. We have quite enough to do to develop the territory we have without acquiring further responsibilities. Any report to the contrary is absolutely unfounded."

The Irish Bill

The long anticipated and apprehended bill for the reform of Irish administration was presented to the House of Commons by the Chief Secretary for Ireland, Augustine Birrell, May 7th, and was passed on its first reading with the use of the closure by a vote of 416 to 121. The bill provides for an administrative council, consisting of 82 elected and 24 nominated members, the latter to be named the first year by the King and afterward by the Lord Lieutenant of Ireland. The other members will be elected on the local government board franchise in which peers and women have the right to vote. The Under Secretary of the Lord Lieutenant will be an ex-officio member of the council. The new council will have no legislative powers of any kind, and it will not be able to levy or remove the smallest tax. The council will be elected for three years. The Lord Lieutenant may be a member of any religious denomination, and will have veto power over all measures passed by the council. The Imperial authorities retain their control over the Supreme Court Judicature, Royal Irish Constabulary, Dublin Metropolitan Police, the Land Commission and the Prisons Board. The following departments of the Irish administration are to be brought under the control of the new

council: the Local Government Board, Department of Agriculture. Congested Districts Board. Commissioners of Public Works, National Education and Intermediate Education, Inspectors of the Reformatory and Industrial Schools and the Registrar General. The council will have at the start committees on Finance, Public Works, Education and Local Government, with chairmen appointed by the Lord Lieutenant, and may establish other committees at their pleasure. Elementary and secondary education will be under the control of the council. An independent Irish treasury is to be established with a Treasurer for Ireland, and into this will be paid the money appropriated by Parliament for Irish expenses in a lump sum voted every five years to be spent at the discretion of the council. The eight boards under the council at present cost a little over $10,000,000 a year. The Government proposes to increase this by $3,250,000 yearly, of which $1,500,000 is to be devoted to public works and the general development of the country. Ireland will continue to be represented as now in the House of Commons. Mr. Birrell, in presenting the bill, said its object was to place the regulation of purely Irish affairs within Ireland herself. The laws passed in the House of Commons did not go, for administrative purposes, to their lawful consignees, the Irish people, but to officers belonging to a system, called more conveniently than accurately "Dublin Castle." For the purpose of his bill tonight he would assume that the "Dublin Castle" rule was a failure. It was no longer a center of jobbery and corruption, but it switched the people off from the great current of national life and feeling, and that was not the way to secure the regeneration of Ireland. In conclusion Mr. Birrell said:

"The Government has been told that the bill paved the way for home rule. If the bill passed and the new Council was a success, then, I dare say, it might pave the way. If, on the other hand, it was a failure, it might present considerable obstacles. But surely the Unionists will not refuse Ireland an opportunity for training her people to acquire any right they ought to possess, because if the measure prove successful one of the difficulties in the way of home rule will have been removed. The Irish people should not be denied the right of showing themselves fit for self government and kept in poverty, disease and disorder."

Arthur Balfour, leader of the Opposition, declared the bill was grossly unfair. It would do nothing legitimately to satisfy Irish aspirations, but it would reduce the administration to an impotent and chaotic condition. It was intolerable that the Irish members should remain in Parliament interfering in Scotch and English affairs while the House of Commons would be unable to say a word in the analogous business of Irish administration. John Redmond, the Irish leader, declared that the bill could not be regarded in any way as a substitute for home rule. He mildly commended the bill and sharply criticised certain features, particularly the inadequacy of the funds provided for Irish development. A convention of the Irish Nationalists has been called to meet in Dublin, May 21st and 22d, at which Mr. Redmond will present the bill for discussion. The bill was largely the work of James Bryce, former Secretary for Ireland, but now Ambassador to the United States. The Cabinet is divided on the question of home rule; the Premier, Sir Henry Campbell-Bannerman, and Mr. Birrell favoring it, and Chancellor of the Exchequer Asquith and Secretary for War Haldane opposing it, which accounts for the compromising nature of the measure. It was being attacked vehemently by both the Unionists and Nationalists' press, the former because it goes too far, the latter because it grants too little.

Imperial Conference of the House of Lords

Before the Imperial Conference adjourned, Mr. Alfred Deakin, Premier of Australia, attempted to secure at least a recognition of his project for colonial preference by introducing a resolution in favor of levying a tariff of 1 per cent. on all foreign goods imported into any port of the British Empire, the receipts to be used to create a fund for the promotion of inter-imperial trade by such means as the subsidizing of steamship lines and the laying of cables. The Government opposing this proposition and Sir Wilfrid Laurier of Canada speaking against it, the resolution was lost. The Confer-

ence approved a resolution presented by Dr. Jameson, of Cape Colony, urging the Government to consider the possibility of granting preference on articles now subject to duty. He hoped that reciprocity would be tried as an experiment. Great Britain now had a duty upon wines, sugar, tobacco and tea. Why could not the tariff be reduced on one of these; for example, on tobacco, which would greatly benefit South African trade and also relieve the people of England? The Government opposed this resolution. Sir Wilfrid Laurier presented a motion to re-affirm the resolution adopted by the Conference of 1902, which was held under the auspices of Mr. Chamberlain. The motion was adopted with the Home Government dissenting to the clause recommending preferential duties. Finally the Conference agreed unanimously on a resolution affirming the belief that greater freedom and fuller development of commercial intercourse within the empire will be best secured by leaving each part of the empire liberty of action in selecting the most suitable means of attaining them, having regard for its own special conditions and requirements, every effort being made to bring about co-operation in matters of mutual interest. The Conference also carried unanimously a resolution in favor of the empire doing its utmost to insure the carrying of British commerce in British ships. All of the Premiers were created Privy Councillors by the King at Buckingham Palace with the exception of Alfred Deakin, who now, as in 1902, declined the favors on principle, believing it inconsistent for a colonial politician to receive any honor from the Home Government. General Botha, at a dinner given in his honor by the London representatives of Transvaal banking, commercial and mining interests, referred to the development of the country in the following language:

"My visit to London is not a visit on my own behalf only, but I am here more as the representative of the whole population of the Transvaal; and if my visit leads to any success, so that the link between the Transvaal and the mother country is made stronger, I am sure that every one of my people will rejoice. I have heard the prophecy made that if my party were to attain to power the mining industry in the Transvaal would be oppressed. Now I think many of you know what election speeches signify, and are aware that they do not belong to the category of speeches that ought to be taken too seriously. My Government and I have always been in earnest, and are still in earnest, to do justice by the mining industry of the Transvaal; and I do not hesitate to say here tonight that my Government will use their best endeavors to make the mining industry a success, and a great success at that, because we know that the prosperity and the progress and the welfare not only of the Transvaal, but of the whole of South Africa, are materially dependent upon the development of that industry. In the past, unfortunately, there was an unhappy relationship between the people of the Transvaal—between the different sections—but, thank God, that is now fast disappearing. I would ask you here to co-operate and work with me and my Government to create such a state of affairs in the Transvaal, and to advance the interests of the country in such a way that every white man there may live in the future in contentment and happiness. I have thrown my small weight into the scale to work for co-operation, for reconciliation, and for the amalgamation of the two white races of South Africa. I am glad that I can state with perfect frankness that I do not despair of being able—on the contrary, I have the fullest faith that I shall be able—to make of those two great races of South Africa one solid, united and strong race. We have today in the Transvaal two great industries; and my prayer is that these two great industries may co-operate like two brothers for the common welfare. Because it is impossible, so far as my knowledge of circumstances there goes, for those two industries to be opposed to one another. In the gold industry there we have large mineral areas which have still to be opened up; and I hope that the people of the Transvaal will put their shoulders together and develop the country in such a way that in the near future it will be occupied, not only by its present population, but that the white population will be materially increased. And I hope that the friends who are here tonight will not only be represented there by the interests which they have at stake, but that the country will have become so attractive that they will come and establish themselves in it—they and their wives and families. There are the big industries of agriculture and cattle breeding. I hope that in this respect also we shall be able to co-operate in order to make these industries what they ought to be, and that the Transvaal will be, not only a country which will import heavily, but that it will exchange imports for exports, and, with the existence of free trade, that it will have a large export trade with this country. The mining industry has undoubtedly supplied the farmer there with a great market, and I only want to give you the assurance that the farming population of the Transvaal are not going to quarrel with their best market."

——Lord Newton's bill for the reform of the House of Lords by making the

membership in part elective and in part dependent upon services rendered to the State, was discussed in the House of Lords in two sessions. The Earl of Crewe declined as a representative of the Government to assume responsibility for the bill, and in his speech did not disclose the plans of the Cabinet. Lord Rosebery opposed the bill because it did not comport with the dignity of the House of Lords, and would be kicked out anyway when it reached the House of Commons. The bill was finally withdrawn and Lord Cawdor's motion for the appointment of a committee to consider suggestions for increasing the efficiency of the House was carried by a vote of 198 to 46.

Japanese Diplomacy

A treaty has been negotiated between Japan and France in order to maintain the status quo in the Far East. France recognizes the Japanese claims in Korea and Japan will not interfere with the French possessions in Indo-China and Siam. It is understood that Great Britain has kept in touch with these negotiations and that the three Powers, together with Russia, are practically united in an agreement to prevent aggression by any European nation or the United States on their possessions in the Far East or on China. It is also reported that England and Russia have come to an agreement respecting their interests in Central Asia, as well as the Far East. Germany is left out of consideration in these negotiations. Prince Fushimi, the Mikado's cousin, who is visiting England, has been received with great ceremony and good will in London. As an indication of the desire of the British Government not to offend Japan, the Lord Chamberlain has refused to permit Mrs. D'Oyly Carte from presenting the Gilbert and Sullivan opera "The Mikado." It is explained that the Emperor is regarded as sacred by his subjects, and to burlesque him in a comic opera is as offensive to the Japanese as it would be to the Roman Catholics to put the Pope on the stage in similar manner. There is much resentment manifested, however, against this attempt to enforce a political censorship. An interpellation was made in the House of Commons calling the attention of the Home Secretary to the fact that a certain play called "Hamlet" was being produced in England, which treated in a disrespectful manner the King of Denmark and the political conditions of that country.

The Birth of an Heir to the Spanish Throne

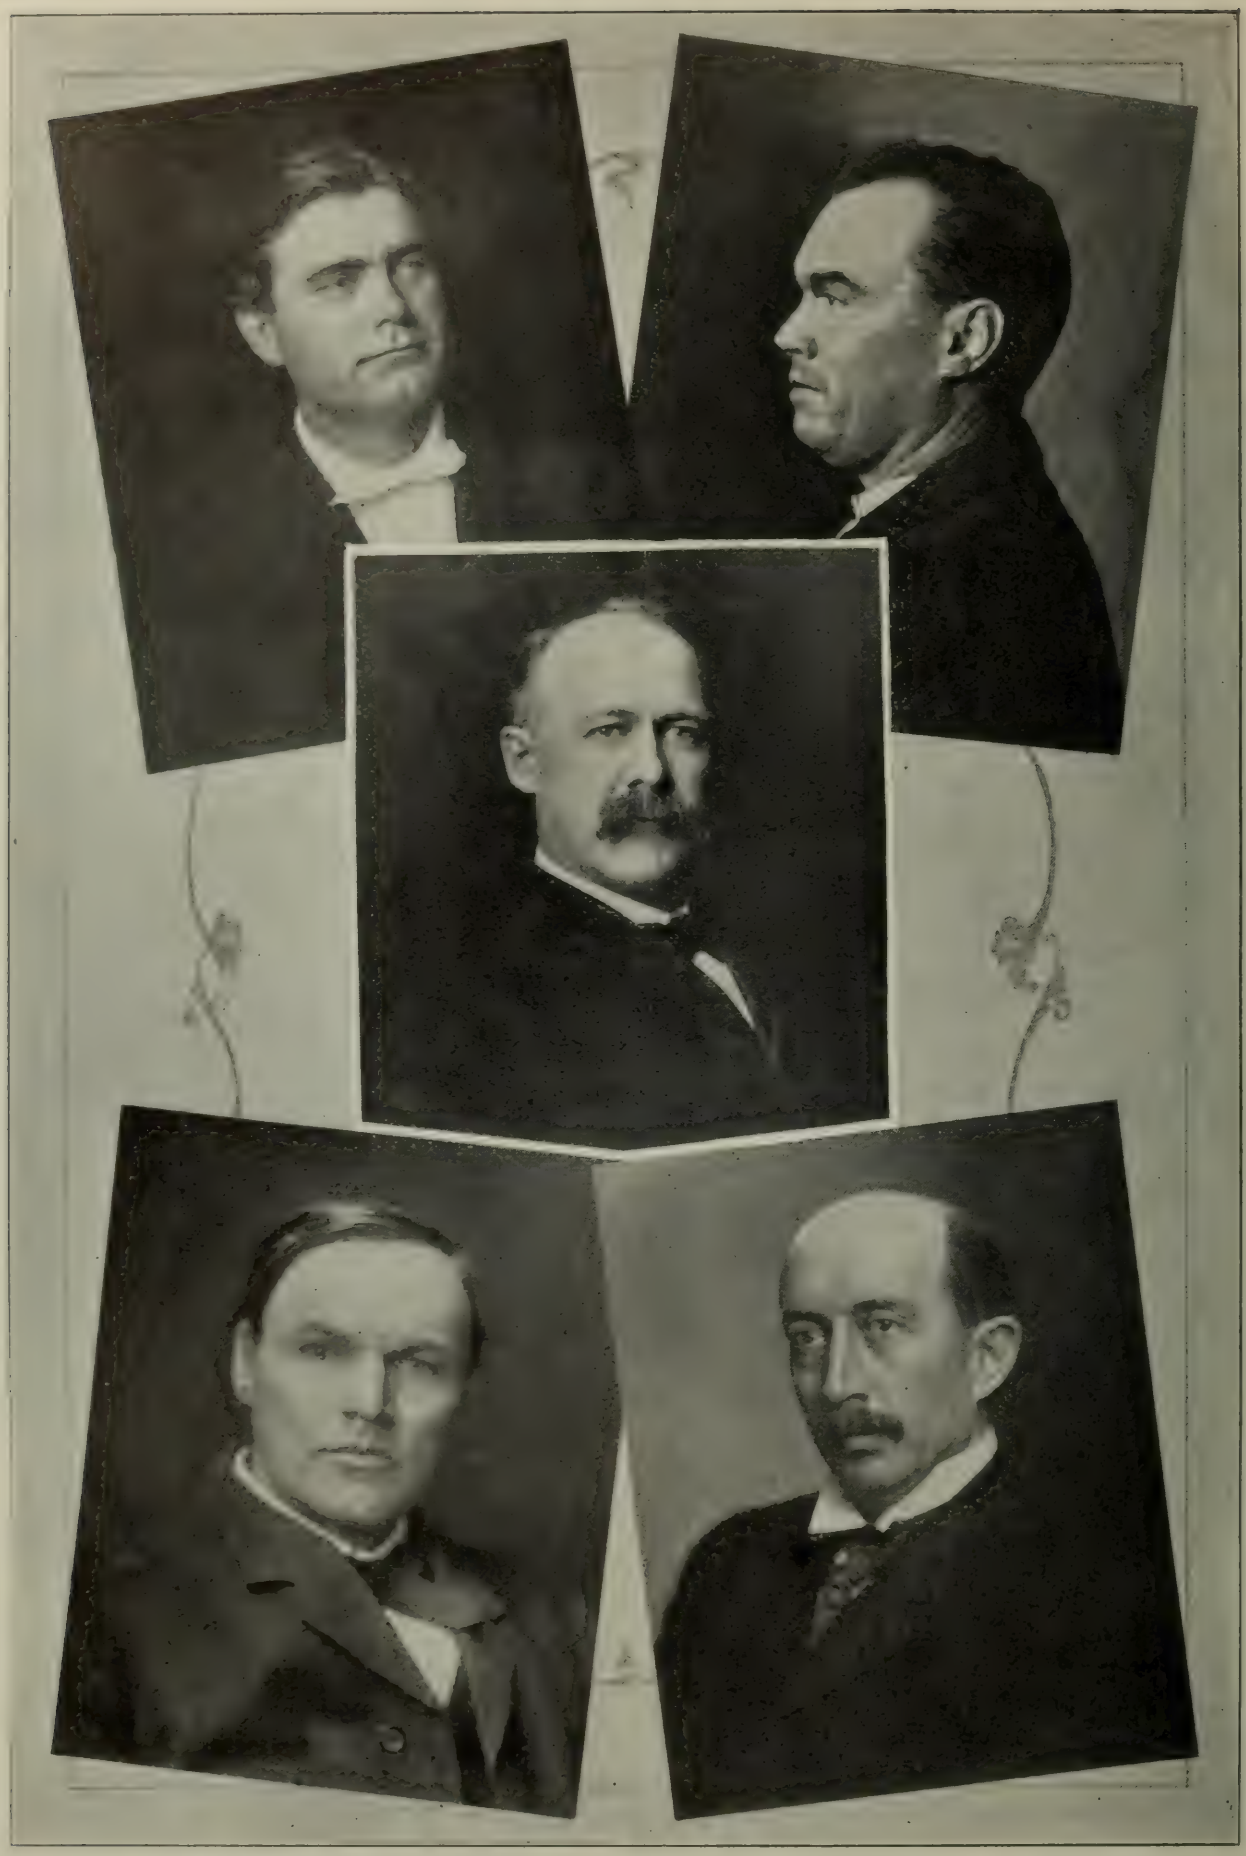
A son was born to King Alfonso and Queen Victoria of Spain at the Royal Palace in Madrid about noon on May 10th. According to the rules of Spanish etiquet the Court, the members of the Government and the Diplomatic Corps are required to be in attendance on the birth of an heir to the throne, and all these dignitaries, in full dress, were hastily assembled in the ante-room of the Palace. The custom prescribing the actual attendance of the Premier at the birth has been modified, so Premier Maura received the announcement from the Duchess of San Carlos, Mistress of the Robes. The infant was then carried by the young King upon a golden salver to the ante-room, where the Premier raised the veil and the King announced to the Court: "I present to you my beloved son, the Prince of the Asturias, and successor to the throne of Spain, to whom my dear wife, Her Majesty the Queen, has just given birth." The infant weighs 8¾ pounds, and is said to resemble his mother rather than the Austrian type, as it has a fair complexion and blue eyes, altho the Bourbon nose persists. The Queen insists upon violating the Spanish etiquet by nursing her child herself. The birth was registered in the legal manner, and the christening will take place this week with the Pope as godfather. The name to be given the child is Alfonso Pio Christino Eduardo Francisco Guillermo Carlos Enrique Eugino Fernando Antonio Venancier. The King has signed a decree transferring the title of Heir Presumptive from Prince Charles of Bourbon to the infant Prince. As the twenty-one cannon shots announced the birth of a male heir, the people all over the kingdom ceased their business and devoted themselves to public celebration. A sumptuous supper was served at midnight at the expense of the King to all the troops in Spain, and he distributed

$10,000 among the poor of Madrid. One thousand prisoners were pardoned, including eight who were condemned to death. Public fêtes, dinners, concerts, opera performances, bull fights and a lottery drawing will be given in honor of the Prince during the three days' holiday. The Municipal Council of Madrid has opened banking accounts for the poor children born in the city on the same day, granted $10,000 as marriage portions for young girls, and will provide university courses for four poor students.

The Secret Duma

The socialist and labor members of the Russian Duma during its recess are holding a party caucus in London. They were not able to meet in Russia nor would Finland receive them. They passed successively into Sweden, Norway and Denmark, but were not allowed to remain in either of these countries because the police ordered them to move on. Finally they took a steamer to London, where they have been permitted to hold their meetings in the Whitechapel district. Three hundred or four hundred delegates are in attendance, including not only the Left of the Duma, but representatives of the various revolutionary and labor organizations of Russia. Maxim Gorky, who has been living at Capri, Italy, during the winter, is at the meeting. The sessions are held in secret, but the object of the assembly is to determine whether the radical members of the Duma shall continue to co-operate with that body or force its dissolution and organize a revolution. The radicals are highly incensed at the compromising attitude of the Constitutional Democrats and the efforts of President Golovin to conciliate the Government and prevent dissolution. A decided clash occurred between the two parties over the recruiting bill which was presented by General Rudiger, Minister of War, to the Duma in a very dictatorial and insulting manner. He demanded an appropriation for the preparation of the conscript lists and the enrollment of 459,000 recruits as the military contingent for the year. He said the recruits were necessary to uphold Russian military prestige and that if the Duma refused the project it would be carried out anyway. His provocative language and manner aroused a storm of denunciation and the President was unable to keep order. Deputy Zuraboff, a Socialist, retorted in the following language:

> "Your army is rotten. You are a disgrace to the Empire. All you are good for is to shoot down unarmed laborers and to cut the throats of fugitive Jews. The morals of your officers are such that we hate to expose our honest sons to their corrupting influence."



President Golovin reprimanded the violent speakers and finally adjourned the session. On the following day the President apologized in behalf of the House for the unparliamentary language that had been used against the army and the Government, and said he considered it his duty to announce that the House regarded the army, which was true to the Fatherland and the Government, whose supreme head was the Emperor, as deserving of respect and gratitude. The Socialists inserted upon the minutes a signed resolution protesting against the language of the President. The recruiting bill was passed by a vote of 220 to 194. A resolution was adopted setting forth the necessity of decreasing next year the number of men called to the colors and passing a law abolishing the custom of using soldiers as servants for officers and as police. It is said that the Government has decided that the Socialists now in London taking part in the so-called "Secret Duma" shall be stopped on the frontier on the ground that they left the country without passports or arrested if they attempted to return to Russia. If the members of the Left, by being thus debarred from the Duma or by their irreconcilable attitude, should no longer work with the Constitutional Democratic party, this party may attempt to form a majority by allying with the more moderate members of the Group of Toil on the one hand and the Octobrists, Poles and other members of the Right on the other. The attitude of President Golovin would indicate that they have lost hope of keeping up the alliance with the Left.——Grand Duke Nicholas Nicholaivitch, a second cousin of the Czar and President of the Council of National Defense, was married at Yalta to Princess Anastasia. of Montenegro.

The Idaho Murder Cases

AT Boise, the capital of Idaho, William D. Haywood, Secretary and Treasurer of the Western Federation of Miners, is now on trial for the murder of Ex-Governor Frank Steunenberg. Others indicted with him for this crime are Charles H. Moyer, President of the same labor union, George A. Pettibone, a member of its executive committee, and Harry Orchard, who admits that he killed the ex-Governor by means of a bomb planted at the gate in front of his house in Caldwell, with wires so attached that an explosion would be caused when the gate was opened. Haywood's trial comes first. The leading counsel for the defense are Clarence S. Darrow, of Chicago, and E. F. Richardson, of Denver. Senator William E. Borah and James H. Hawley will conduct the prosecution, and Judge Fremont Wood presides. On following pages we publish portraits of the prominent figures in this important case. At the beginning of the present week the jury had not been completed. It is expected that from three to four weeks will be consumed in taking the testimony of witnesses for the prosecution.

Steunenberg was assassinated on December 30th, 1905, five years after he had retired from the office of Governor. It is asserted by the State in this trial that he was killed by the defendants on account of his official action at the time of the labor riots in the Coeur d'Alene mining district in 1899. In that year, after the destruction of the Bunker Hill and Sullivan mill (in April), he obtained the aid of Federal troops, who suppressed what was practically an insurrection. Soon after the murder, Harry Orchard, a stranger whose movements excited suspicion, was arrested in Caldwell. In his possession were found various articles and papers which, it is said, connected him and the crime with the union officers who were afterward indicted. James McPartland, a famous detective who brought to justice the "Mollie Maguire" assassins in Pennsylvania, many years ago, was employed in the case. He procured from Orchard what purports to be a confession, implicating Moyer, Haywood, Pettibone and one Stephen Adams not only in this crime but also in many others committed in the mining districts of Idaho and Colorado. It is said that the list includes thirty murders and the killing of fourteen non-union miners at the railway station of Independence, Col., in 1904. It is alleged that Orchard asserts in this confession that he was employed by the union officers to do all this dreadful work; also that Adams, an accomplice, made a similar confession, which he has since repudiated.

A requisition for Moyer, Haywood and Pettibone (then in Denver) was honored by the Governor of Colorado, in February, 1906, but no publicity was given to his action. Thereupon the men were quietly arrested and were at once taken by armed officers from Idaho to that State by special train. They were not permitted to consult counsel or to see members of their families. This treatment of them caused protest to be made by organized labor. The action taken was tested in habeas corpus proceedings, and the Idaho authorities were sustained by the United States Supreme Court Beginning with this protest against what was called "kidnapping," there has been in the labor unions of the country extraordinary agitation in behalf of the accused men, agitation at first promoted by and confined to the Socialist element, but afterward spreading thru nearly the entire membership. It was intensified by the recent publication of President Roosevelt's remarks about the defendants. One result of it has been the raising of a large fund for the defense expenses of these men. The claim of the accused officers appears to be that Orchard was hired by the mine-owners to kill Steunenberg and to make a false confession in order that the union might suffer in the estimation of the public

UNITED STATES SENATOR W. E. BORAH,
Special counsel for the State.

HARRY ORCHARD,
Who killed Ex-Governor Steunenberg.

JUDGE FREMONT WOOD,
Who presides at the trial.

CLARENCE S. DARROW,
Special counsel for the defense.

E. F. RICHARDSON,
Counsel for the defense.

MOYER, HAYWOOD AND PETTIBONE.

COUNTY COURT HOUSE, BOISE, IDAHO, WHERE HAYWOOD IS ON TRIAL.

Martyrs of the Revolution

BY IVAN OKUNTSOFF

[Ivan Okuntsoff, the Cossack Revolutionist, was born thirty years ago in a little village in the Baikal region. His father, who is a liberal man, and was chief of the Cossacks of his district for some years, sent Ivan to the Imperial Theological Seminary at Kazan. A year after his graduation he was appointed as inspector of the schools of a large district in Trans-Baikal. Okuntsoff opened many new schools and carried on an educational propaganda, opening the eyes of the most loyal and ignorant subjects of the Czar. After the manifesto of October, granting the constitution, had turned out to be a farce, Okuntsoff came out for the first time as a revolutionist. He started a newspaper at Verchne-udinsk, preaching to the Cossacks the gospel of an armed revolution, for this, he believed, was the only way of saving Russia. For editing this newspaper he was condemned to death in February, 1906, by General Rennenkampf. The Russian press, led by Vladimir Korolenko and Peter Weinberg, appealed to Count Witte in his behalf, and his sentence was commuted to imprisonment for life in the mines at Akatuy. By overpowering the guards he and another man succeeded in regaining their freedom, and Okuntsoff escaped thru Japan to America. He is now in New York, where he will shortly start a Russian newspaper. Such noted writers as Jacob Gordin and Morris Winchewsky will be his associates, and Korolenko is expected to act as special correspondent. Mr. Herman Bernstein, the translator of Chekhov's and Gorky's stories, has made the translation of the following article for THE INDEPENDENT.—EDITOR.]

DREAD fell upon us on the day when five of our fellow-prisoners were to be executed. All were agitated; all paced up and down the cell, wringing their hands, moaning from acute anguish. We were afraid to speak of that which was to happen. The "pardoned" Pashinsky acted as a madman, now sobbing, now cursing. Soon the turn will come for some one else to go to court, and then to the post and to the grave. Each of us thought that his turn would be next. It was growing dark in the prison. And in the darkness we saw terrible apparitions: on the cross-beams of the posts our friends were hanging; near them there were other posts, as yet unoccupied, but all in readiness. A little distance away from the posts there was a long row of dark holes in the ground. Our imagination was overwhelmed by these horrible phantoms.

Whose turn would be next? I thought that mine was next. They will come and take me and hang me. The darkness of the night will hide the crime of the henchmen and the sun of tomorrow will no longer shine for me.

Exactly at eight o'clock in the evening the keys were turned and the door of our cell was opened. Six soldiers entered.

"Okuntsoff, come to the office," shouted the warden.

Usually we were taken to the office without the escort of soldiers, while this time there were five. They surrounded me and led me out. In the office the captain of the gendarmes submitted me to a brief examination and I was sent off to General Rennenkampf's car. When we walked out of the prison gate, it was dark and cold. The fresh air invigorated me. We walked briskly thru the woods, past houses, straight to the station. On the left, bonfires were burning over the graves of our executed comrades. These flames seemed to lure me toward them. Near them stood the posts and on the ground I could see the dark holes. How good it would be, I thought, to lie down in one of them and fall into eternal sleep, without alarms, without pains. No, I want to live, I resolved. Here was a house. Shall I make an attempt to run away? I knew that before I should make ten steps, a shot would be fired at me from behind, a bullet would strike me and death would come at once. But what if I should succeed in escaping? How happy I would then be! No, I could not run away. Twelve soldiers and two gendarmes surrounded me. They had both guns and bayonets.

Suddenly a shrill whistle resounded, then another. Not far from us people lived and worked. They were at their ease and perhaps were as indifferent to

everything about them even as the bright little stars seemed to shine indifferently. The nearer we came to General Rennenkampf's car, the greater was the number of soldiers we met on the way. Everywhere guns. Curses smote the air. It was dreadful. I was alone amidst these indifferent dull people, dressed in gray coats, with hoods. They walked hither and thither, spying. Upon whom? They did not know it themselves. We stopped before a luxurious Pullman car. It was brightly illuminated. People were eating rich food there and drinking expensive wines. They were tipsy and in a merry frame of mind. They had already forgotten about the execution of our five comrades and were now jesting and laughing unconcernedly.

I was alone. Wherever I turned, there were soldiers. I counted them. There were forty-two. I began to feel very cold and I was seized with dread. The "superior" entered the Pullman car timidly and reported, saying: "We have brought him." An officer came out, licking his lips and cleaning his teeth with his fingers.

"Wait. Watch him closely," he said.

IVAN OKUNTSOFF.

A minute later he came out again and ordered the soldiers to take me to the prisoners' car. They brought me over there, stationed three sentinels near me, and twelve outside. I sat in a corner and waited. I waited for death. It seemed to me that officers would soon come, read to me the death sentence and take me to one of the unoccupied posts. I sat thus for two hours, waiting and suffering.

At eleven o'clock my comrades, Shinkman and Mirsky, were brought into the car. It turned out that General Rennenkampf decided to take us along with him as a surety. He issued an order to the effect that in case any attempt were made upon his train Okuntsoff, Shinkman and Mirsky would be executed. The punitive detachment was riding in two trains: the soldiers and we were in the first, while the second was occupied by Rennenkampf with his suite and the court.

We stopped for five days at the station of Khilok—this was the same Khilok where by order of General Meller Zakomelsky and some fifty workmen were imprisoned, seven of whom were executed. The field courts-martial worked energetically for five days; thirty-six men were tried and eighteen of them were condemned to death. Rennenkampf was "generous" and he shot only eight men.

The comrades that were condemned to death were brought from court to our car. They were all young men who had been sent during the war from Russia to Khilok for various kinds of work. Now these young men, instead of being rewarded for their hard work, were executed; instead of being sent back to their homes, they were buried in a strange land amidst mountains and woods. The fathers and mothers of these young men did not know anything about Rennenkampf's sentence, nor is it likely that they know of it even now.

Perhaps even at this day the old parents are longing for their sons and waiting for them, while they, the young men, who had yearned for freedom, are now resting under the green pine trees with Russian bullets in their breasts.

"As soon as they will kill me," Belyayev, one of those that were executed, said to me while leave-taking, "send this letter to my old folks in the province of Oryol. This is my will. I have willed to them

my blood. Let the old people know how the Czar rewarded me."

It was cold and depressing in the car. It was half dark, for the windows with the iron bars admitted very little light. There were now forty people in the car; eighteen of them were condemned to death. The field courts-martial worked quickly, day and night, condemning people to death daily.

The comrades would come from the court into the car.

"Well, how is it?" we asked, with alarm.

"What should it be? Sentenced to be shot."

The courts-martial were not stingy in the matter of death sentences. They condemned to death four youths (sixteen, eighteen and nineteen years of age) merely because they thrashed a Black Hundred machinist while they were in an intoxicated condition. Rennenkampf "pardoned" them by commuting their sentence to ten years of hard labor in Siberia. The machinist Marchinsky was condemned to death and shot merely because he consented to cool off the engine while he was in an intoxicated condition. Mekertichev was executed for having made a collection for the striking workingmen. They were all charged with participating in an armed uprising and the overthrow of the existing form of government.

The young men gave vent to their grief before death in various ways. Belyayev sang with a soft tenor his favorite song, "Why have you bent over the river?" Marchinsky was jesting, laughing a sickly laughter and saying, "A man grows accustomed to everything; he should also grow accustomed to death. I am trying to face cold, senseless death." Rosenfeld, pale, his lips blue from the horror he was experiencing, his eyes wide open, was seeking all the time for a way of escaping from the car; the others were noisy, celebrating mass after their own souls, sobbing. At times it seemed that we all lost our reason for grief.

Death was nearing. It was approaching our car with every passing moment. The soldiers were digging graves and putting up new posts. There was no longer any hope for the eight men condemned to death.

They bade us "goodby." We were taken farther east, to the town of Chita. We took leave of our comrades as of live corpses. We felt like remembering all their features; we felt like looking into their souls and pouring into them part of our life.

"If you remain alive," they shouted, "tell everybody that we knew how to work and that we will know how to die."

And, indeed, they knew how to die.

It was on the morning of the 18th of February. Khilok was astir. A large crowd surrounded the car in which the condemned men were brought, and they waited in painful silence.

"If you wish to receive the priest he will come here at once," declared the officer on duty.

"It is not necessary. If he wishes he can escort us to the grave as a private person."

Around the car stood a close chain of soldiers. The condemned men came out. Their pale faces betrayed their acute inner suffering. The soldiers now surrounded the prisoners as with a chain of steel and the funeral procession started forward to the place where the men were to be executed. The priest was at the head of the procession, the physician was walking in the rear, behind him walked the crowd. The people were going to bury the living corpses.

Eight young men were going to their death.

Comrade Rosenfeld lifted his hand and turning to the crowd, said:

"Citizens, comrades. Before the face of death, we who are to die, adjure you to continue the struggle. Citizens, we shall die soon. Swear that you will continue to struggle against the reigning administration, to struggle for the happiness of the people. Remember the last will of those that die for freedom."

He became silent. Suddenly the men began to sing:

> "Let us renounce the decrepit world,
> Let us shake its dust from our feet."

The men who were to die sang their funeral march. The song flowed on smoothly. The crowd took up the strains. The song broke off into a sob, and soon the people were sobbing. Bearded, gray-haired men felt their

throats contracting, and tears gathered in their eyes.

The soldiers slackened their pace. They pulled their caps lower over their eyes. At last they too began to cry, they could not endure it any longer.

And the song flowed on, gaining in volume and breaking off into a sob. Then it ceased. All became silent, and only the stamping of the feet broke the funereal stillness.

At last they reached their destination. There stood the posts, and near them were the graves. Near each post was a new, unvarnished coffin. Eight coffins near the eight posts.

"Company, halt!" resounded the command.

They stopped. Death-like silence reigned. The condemned men walked over to the place where they were to be executed and examined their coffins.

"Comrades, this is my coffin," shouted Rosenfeld, kicking "his" coffin.

"And this is mine."

"I will take this one."

They selected for themselves the place of "eternal rest." They stationed themselves near "their posts" and were ready. The soldiers tied the men to the posts. Then they brought bandages for their eyes.

"It isn't necessary. It isn't necessary, dear. Let it be this way. We are not afraid to die."

A company of soldiers took its position in front of the men. The clicking of guns resounded, and the guns were raised, aimed at the condemned men.

The priest began to read the prayer for the dying.

Suddenly a song burst forth again from the men at the posts. For the last time the men who were to die sang the song with which their souls had grown related. Eight workmen, tied to the posts, were singing: "You have fallen victims in the fatal struggle."

The soldiers were taking aim, but they did not fire as yet, as tho they were considering whether or not to kill these martyrs who sing the song of freedom over their own graves.

The song of the condemned men flowed on and sobbed. The crowd listened to the singing and also sobbed aloud.

"You have done all you could for the people,
For their honor, their life and their freedom!"

The command rang out and the first volley resounded. The men were only wounded. They were not yet killed.

"Brethren, soldiers, don't let us suffer. Aim at our breasts, straight at our breasts. Quicker."

The singing still flowed, groaning from time to time. Another command and the second volley resounded. Two of the men bent their heads down and dangled on the posts.

"We wasted away in the damp cells."

The volleys and the singing succeeded one another in turn. After five volleys seven men were killed. Only Ivanov was still alive. He was wounded, he was bleeding, but he still sang on:

"But the stern words are writ already upon the walls."

He had not finished. Another bullet buzzed thru the air and killed him. Ivanov remained dangling on the post breathless.

The doctor came over to him and examined them. It turned out that Borovinsky was still alive. He was breathing and his blood-stained cheeks were flushed. A soldier came over and fired a shot into his breast. All were dead now. And with them the song died.

The blood-stained bodies were taken from the posts and placed into the coffins and then lowered into the graves.

"Cover them up!"

And clods of earth were hurled upon the coffins.

"Company, march!"

The soldiers walked off. And the crowd of people stood there for a long time, looking at the graves in painful silence and deep meditation. On the graves was the bloody inscription:

"Swear that you will struggle for the happiness of the people."

New York City.

A Home-Making Experiment in a City Flat

BY ANNA G. NOYES

[Having ourselves seen the success of Mrs. Noyes' experiment in making a small city flat distinctive, artistic and habitable, we have asked her to write out a detailed account of how she did it for the benefit of THE INDEPENDENT'S readers.—EDITOR.]

WHEN we were married we cleverly averted the customary shower of wedding presents, and so were free to furnish our home according to our own tastes. To secure a maximum amount of home comforts, with a minimum expenditure of time, money and labor, consistent with beauty and health, was the problem we immediately began trying to solve, and I feel that the results of our experiment thus far may be suggestive to others who are conscious of the same problem.

It is said that in New York City one flat differeth not from another flat in glory. On the contrary, we found there was a choice in the amount of sunlight, fresh air and general cleanliness of houses and in the possibilities for keeping clean in one's own apartment. We were fortunate in securing for our nest a four-room apartment with a south exposure for three of the rooms and the bath and a west exposure for the fourth room at the moderate rent of $26 per month. When we were debating the number of rooms to rent, this question occurred to us: Why do we need to set aside a room in which to dine, in which, at the most, we can spend only three hours a day? Put in that way, it seemed like ostentatiously consuming space, and rather than feel guilty of that offense we planned to use the one room for two purposes, of which I shall speak later.

The poor tenant in a city flat has little choice in the matter of architecture, but we ran the risk of offending the landlord to the extent of taking down the gingerbread grill between the sitting-room and parlor, and of filling the mock fireplace with book shelves. We could choose, too, the wall paper and the finish of the floor. The rooms being bright and sunny, the walls could be a dark and neutral color that would be a background for prints, pictures and pottery, and a tone that would not attract to itself, but would form a surface into which darks, lights and high lights could be painted. I found such a paper a gray brown in tone, and at a modest price, thirty cents a roll. I felt that the effect of unity could be best secured by having the rooms which opened into each other, the parlor, study and bedroom, finished in this one paper. The hall was papered a lighter value, and the kitchen and bathroom painted still lighter. The floors we stained ourselves with black walnut stain, and then applied a finish of wax, except in the kitchen and hall; these I painted with a good quality of varnish. I tried both finishes as an experiment. Both give a surface impervious to water and grease and make unnecessary the old-time scrubbing and incidentally "house-maid's knee." Oil does this, too, but the only oil I have seen used is destructive to the bottoms of skirts. Wax is the softer finish, and I should prefer it in a study or parlor or bedroom to varnish, for to maintain it in good order it requires only to be dusted every day or every other day, depending upon the rate of the wind and the humidity of the air and similar atmospheric conditions. It can be renewed at slight expense about twice a year. Varnish costs more to install and to renew, but gives a surface which will resist more than the wax. For the kitchen the varnish on the unstained boards, and renewed twice a year, seemed preferable.

The use of rugs lain down where people walk, over a floor stained and waxed, is now commonly considered the most economic and wholesome plan, and we adopted this plan.

The choice of rugs is a maddening

task to one whose eye is sensitive to color. During my search for them I could not fail to realize that with all our recognized development of machinery, our American products, at least so far as the making of rugs is concerned, are still inferior to the old Oriental, hand-woven rugs. I have no preference for a hand-made article, just because it is made by hand, but only when it is better in color, design and technique. But the hand-made product is more expensive than the machine article, and this fact imposed another limitation. All these considerations necessitated long and frequent visits to the shops. However, a Royal Bokhara and a Kurdestan rug were finally found in a somewhat damaged condition, and I got them for $15 and $20. These colors, the dark reverberating orange-red and the harmonizing tans and blues of the Bokhara, and the rich body blue of the Kurdestan, in which were woven in dignified designs all colors in perfect harmony, determined the quality of all colors to be placed near them. A Bagdad curtain, which I had had for some time, stood the test, and was hung between the parlor and study. After a long search for a rug for the study I have bought, temporarily, a grass rug. To be sure, it is off key, but then it is merely an expedient, and tolerated only because its ultimate banishment is certain. The rug in the bedroom is one of those one-yard square woven Japanese fiber rugs which tones in with the denim bedspread, brass and iron bed and black walnut chiffonier in the room. As we always step out of bed into our slippers this is a sufficiently large rug. To have this room condemned as looking like a hospital room, I interpreted as a criticism decidedly in its favor.

The three large paintings, the two over the book cases in the parlor, and the triptych in the study, shown in the illustrations, I designed for those spaces and carried out in them appropriate color

THE PARLOR

THE DINING ROOM.

schemes. It so happened that at the time we were ready for the two over the book cases, I came across a Japanese print, the colors of which toned in with the Bokhara rug. By means of a small finder, a frame of the desired proportions cut out of paper, I selected two pictures from the print and reproduced them in oil, enlarging them to the size needed for the space they were to occupy. The triptych was made after a summer spent at Lake Memphremagog, and was my interpretation of the long lake, the distant hills, the clouds at sunset, and the big old trees. The colors in this were to be found re-echoing in the Kurdestan rug. Two reproductions of Holbeins, a reproduction of an Alexander, with two Japanese prints, and one of my own still life groups, completed the decorations on the walls at the time the photographs here shown were taken. These smaller bits of color and design are changed from time to time, to the limit of our treasures. We found that even the rarest of our prints appealed to us in a new way when we had felt the loss of them for a period. In the same way we vary the grouping of the pottery, always giving the entire shelf to one or possibly two pieces, and putting some away for awhile. In Japan but one piece of pottery would be displayed at a time, and that in a niche especially designed for the purpose.

As to the furniture, for many pieces we have a personal affection, for we conceived them and planned their sizes and proportions and colors, and then patiently and fondly shaped and molded and carved them.

The chest between the book cases in the parlor, I began at college in the carving class and finished at odd times in the attic-shop of my mother's home. The design and treatment are Old English. The hinges of wrought iron were made after my design by a friend. The low backed chair by my desk, I began in the shop where I taught manual training for three years, but as leisure for carving

there was stolen from my professional duties or from needed sleep, it was not finished until my future husband took the pieces to his shop and there put them together. The design is as entirely as anything can be my own. That is after studying many photographs of chairs and many chairs, I worked out this one. It brought the support where it is most needed when writing, at the base of the back. When the chair was finished it was hard to decide whose work it really was, and whose name should be carved in it, so we made up a monogram of the initials of both our names, G and N. Inquisitive and suspecting friends and students who saw the monogram GN wondered what it meant. "Oh, that's just N. G. to forestall criticism," was the evasive reply. But when the construction of a table and other bits of furniture followed the chair, then the little circle began to suspect why. One evening, before we were married, when we wanted to be alone, we went to the most thickly settled part of the city to a Chinese restaurant for supper. Here our tea was served to us on a beautifully carved and inlaid table, and we sat on those stools of perfect proportions and design and workmanship. The table was not very large, but large enough for two or even four, so we measured it and planned to have one of the same proportions for our own dining table. The stools, tho beautiful to look at, lacked what was to us a necessary back. We planned chairs to go with the table, but lack of leisure has thus far prevented our making them, and in the meantime the chairs shown in the photograph answer, and they cost only $3 apiece.

The desk I designed and made one summer. Its shelf rests as did the old-fashioned ones, on two sliding supports. I also made the handles and key-plates of brass and "just for fun" made the key. The typewriter table we consider one of

THE STUDY.

our best pieces. The little drawers are of the right size for the paper used, and there is the right number of drawers for the different kinds of paper, so that each is kept by itself.

But we feel that the most successful piece of furniture we have made is the little serving table. The proportions are better, the lines are more graceful, and the construction is not unnecessarily heavy, and then the color of this is one of those indescribable tones of red, found in the bark of some trees, and in new buds in the spring. When we finished this, we felt as if all we had done before were but exercises to prepare us to create this treasure. To get this color we used one coat of acetate of iron on fumed oak and rubbed it down with boiled oil. The copper handles too are better in design, simple and plain in construction, and tone in with the color of the table most alluringly. This table, like the room in which it is placed, serves two purposes. Upon it are kept the things needed every day on the dining table, which do not have to be taken to the kitchen to be washed or otherwise cared for, and in the partitioned drawer the silver and napkins are kept in their proper spaces. Then when we wish to add to our seating capacity at the big table, since this small table is of the same hight and width, it is placed at the narrow end of the big table, and with this arrangement we can accommodate six or even eight.

THE FURNITURE I MADE.

The plate rack was designed to hold that particular set of old blue willow dishes, which I picked up one summer in Gloucester. The design and treatment are similar to that of the chair and table.

Several have asked us what was the original cost of the wood and the time spent in making the various pieces. It should be understood that those who are spending eight or ten hours a day on their professional work, can only devote some of their leisure time to house fur-

nishings, and, therefore, the amount of time thus spent is hard to estimate. Just to give an idea of the cost, we have tried to recall the time and money spent in making the few pieces here described and illustrated. These are as follows:

	Cost of Wood.	Time.
Typewriter table	$2.50	35 hours.
Serving table	2.00	25 "
Dining table	4.00	60 "
Chair	2.50	28 "
Plate rack	1.00	35 "
Magazine rack	1.50	20 "
My desk	5.00	120 "

This does not include time spent in designing but only in executing the designs. It will be readily seen that this is not a way of saving time which is so frequently interpreted in terms of money. We did not have that point in mind. We made these things because we liked to make them, and we made them for our use because we happened to need them. The only occasions when I consciously reckon the time I am consuming, is when I am doing what is to me drudgery, and then I plan to cut it down to its smallest possible limit. If I can save five minutes from drudgery I have gained them and more for creative work, for growth and development.

This method of furnishing one's house is obviously not a possible one for many. It necessitates access to shops and still better to shops where power is available. A great many tools are needed for the wood work, and to work in copper requires still another equipment and set of tools. Some day our manual training shops, which the city has so thoroly equipped, may be accessible to adults. The public parks are free to all, the school lecture halls are being used for adults, night classes are being held in the schools for courses in English and bookkeeping and other studies, may we not look forward to the shops being opened too?

In studying the matter of serving the food, I began by questioning the very table itself with its conventional coverings. First, there is applied to the natural wood a highly polished varnish, very sensitive to heat. This necessitates a padded cover to protect it; then there must be added, to cover this, a table cloth of conventional white linen, cold, stiff, and unsympathetic; then doilies to protect the table cloth. Here are at least three thicknesses of textiles and one of sensitive varnish to be installed and maintained on a table, before any utensil or food can be served. How all or any of these could be gotten rid of was to me an interesting problem. We knew that wood rubbed down with oil, was unaffected by water, heat and greasy substances. So we made the table of quartered oak, and rubbed it down with boiled oil. The cost of maintaining it is the time spent in wiping it off with a clean wet cloth at the close of each meal. As for napkins, we use paper ones, as many as we like, and burn them up. We buy these by the thousand and calculate that the cost of eight paper napkins equals the cost of providing one linen one.

Another problem was how to serve the meal without having to leave the table. For this purpose, we made another table, also of oak and rubbed down with oil, which stands at my left and is within easy reach as I sit at the dining table. The second course is placed here before the beginning of each meal, and is easily reached when needed, after the empty and soiled dishes are transferred thither.

This side table contains, as I said before, a partitioned drawer in which are kept the extra knives, forks, spoons and napkins, which, when needed, are as easily procured from the drawer as the food from the top of the table. When not in use on the larger table the cracker jar, salt shaker and covered copper bowls for nuts and raisins, form a group of artistic merit on the serving table. At the close of each meal the dining table is set back against the wall; the little serving table, with its group of copper and pottery, is as attractive a group in a study as in a dining room. This table thus adorned, together with our desks and desk chairs, a Morris chair, the magazine rack and typewriter table, readily carries for the remaining hours of the day, the atmosphere of a study.

As to the care of these rooms, including the bath room, I give them all a thoro cleaning once a week. This takes three to four hours, and then daily I spend about half an hour where it is most needed. About twice a month, oftener, if necessary, the rugs are swept on the roof, and the janitor cleans the windows. On

cleaning days, I put on my gymnasium suit, and a dusting cap, and then go thru the regular cleaning in the same old primitive way armed with the customary implements. I take no pleasure in the work itself. To get one's nose and eyes filled with dust and dirt, under these circumstances, can never give me any pleasure. The clean house is a satisfaction, but I cannot believe that anyone if left free to choose, would prefer to clean for an occupation. Some day we shall have decent muncipal housekeeping, clean streets and every house fitted with necessary pipes and machinery for vacuum cleaning, as inevitably as today they are provided with fire escapes, and then the dust of our floors and shelves and rugs, will reach the fire directly thru the pipe, instead of thru the hand-operated dust pan. As long as I realize this as a problem to be solved in housekeeping, I do not view my kind of house-cleaning as a solution. Until some form of mechanical cleaning can be cheaply installed, the best a poor person can do, is to keep the house and its furnishings so simple as to reduce the cleaning to its lowest terms.

NEW YORK CITY.

England's Parliament Again in Debate

BY JUSTIN McCARTHY

THE members of Sir Henry Campbell-Bannerman's Cabinet, as they met the House of Commons on the opening day of the adjourned session, must have been very light-hearted personages indeed if they did not feel oppressed by a heavy sense of responsibility. They have great work to do and but little time to do it in. It appears already perfectly certain that there will have to be an autumn session, which means that the holiday season, the season of relief from incessant and difficult work, will have to be cut very short, and that even with this additional labor it will not be possible to get thru in the course of the year that proportion of their tasks which at one time they hoped to accomplish within such a limit.

The first great measure undertaken by the Government is the reconstruction of England's military system, which has been devised by the War Minister, Mr. Richard B. Haldane. When that measure shall have advanced another stage the House will be invited to consider the Government proposals for what is now called "devolution" in Ireland—in other words, the measure which is to prepare the way for the realization of the principle of Home Rule. The Liberal Ministers have also undertaken and announced a most important series of measures for the regulation of public house licenses in these islands, with the object of promoting the cause of national temperance, and any one who knows anything about the enormous influence of

LORD CROMER.

the brewers and the distillers and the owners of drinking shops here will easily understand what an immense opposition such a scheme will have to encounter and what numberless facilities for opposition the details of each measure will offer. Moreover, the Government have in hand new plans for dealing with the still unsettled land question in these countries, and some very important subjects relating to national education in schools and colleges. Then, of course,

GENERAL BOTHA.

there must be long discussions on Mr. Asquith's budget, and, on the whole, it is not too much to say that no English Government in our times could have had their hands more full of heavy and momentous work.

Mr. Haldane's reconstruction of the army is just at present occupying the main attention of Parliament and of the country, and Mr. Haldane, if he desires to be an object of general contemplation, may be assured that he has the eyes of

SIR ELDON GORST.

Europe at least turned directly upon him. Now Mr. Haldane is about the last man the friends of whose earlier days could have foreseen for him anything like the career of a great reconstructive War Minister. His early studies appear to have been almost altogether in the fields of science and philosophy, and for a time he became a student at the University of Göttingen, where he absorbed himself in the study of metaphysics under a great German professor. His published works include a translation of Schopenhauer's "World as Will and Idea" and a life of Adam Smith. He studied law and was called to the Chancery Bar, in which he won great distinction, and in 1885 he was elected to the House of Commons as a supporter of Gladstone and in every sense an advanced Liberal.

Now these studies, these publications and these successes do not seem exactly like the probable preliminary movements to a remarkable career as a War Minister, and indeed any one hearing of such a career for the first time might be well excused if he regarded the story of Hal-

dane's life as something like a chapter out of "Gil Blas" or "Gulliver's Travels." Yet it is perfectly certain that Haldane had somehow or other succeeded in making himself a master of the special subjects which are the concern of the War Office, and that he has now succeeded in planning out a scheme for the reconstructing of the whole British Army. I must frankly admit that my own knowledge of such questions does not enable me to form any personal judgment whatever as to Mr. Haldane's capacity for his present work, but I cannot help seeing that he has impressed the whole public mind with a sense of his thoro fitness for his new undertaking, and that even the criticisms directed against his plans by opponents in the House of Commons, and among them by men who themselves held in former governments the place which he holds now, bear ample testimony to the importance and the reality of his work and to the difficulty of preventing it from establishing something like a new era in the history of England's military organization.

The attention of the public in England has for a time been drawn away from the reorganization of the army, from Mr. Asquith's coming financial statement and from the scheme of devolution by the news which has just reached us from Egypt. That news tells us of the retirement of Lord Cromer, the Earl of Cromer, to allow him his full title, who has given up the position he had held so long as England's governing representative in Egypt. Lord Cromer has been not inaptly described as the maker of Egypt—that is to say, the maker of that Egypt which we now know of and which followed the Egypt of disturbance, distraction and disappointment which England and France strove to manage in a sort of combination with Turkey, and which only seemed to get lower and lower in mismanagement with each succeeding year. Lord Cromer was first known in public life as Sir Evelyn Baring, and in his youth became an officer in the Royal Artillery. He acted for several years as one of the Controllers-General representing England in Egypt, and finally became what may be described as in fact, altho not actually in name, Viceroy of Egypt. He proved himself one of the most enlightened and most practical reformers of his time in any department where reform was needed and could be accomplished. He acted absolutely on the principles of justice, humanity, freedom and fair play, and yet was never tempted into any sudden enterprises for the prompt overthrow of old systems and the instant setting up of new. He declared himself, in one of his reports to the British Government, that "what Egypt most requires and for many years to come will require, is an honest, just and orderly administration, and the establishment of the supremacy of the law in the widest sense of the term." No words could more correctly describe the principles on which Lord Cromer consistently and steadfastly acted during his administration of Egyptian affairs, and the result has been the rapid growth of that new Egypt which may come to be as much of a strength to England as it had long been a mere weakness and danger. Lord Cromer's failing health is given as the reason for his resignation, and it is understood that he intends to retire altogether into private life. He is not by any means an old man, as old age is reckoned in our advancing days, for he was born on February 26th, 1841.

His successor has already been appointed in the person of Sir Eldon Gorst, son of that once very conspicuous John Gorst, who was one of the most important members of that famous Fourth Party led by the late Lord Randolph Churchill. Sir John Gorst is, apart from his great political capacity, one of the best educated and most accomplished men I have ever known. I had the pleasure of his acquaintance during many years of my life in the House of Commons, and I am sincerely glad to know that his son has been thought by the Liberal Government worthy to become the successor of Lord Cromer. Of course amid all our admiration for Lord Cromer's system of rule in Egypt, it has to be borne in mind always that that system was absolutely a benevolent despotism and allowed no opportunity for the development of Egyptian nationality and Egyptian aspirations. These are subjects which British rulers in Egypt will

sooner or later have to take into account.

Herbert Gladstone, our Home Secretary, has brought himself into disfavor with a large proportion of the English public because of his having yielded to a loud demand for a mitigation of the death sentence pronounced on the murderer of Mr. Whitely. The newspapers were for days after days crowded with letters from all ranks and classes of society insisting that the Royal prerogative of mercy ought to be exercised in favor of this convict Rayner. Now it certainly does not appear to me easy to understand why there should have been any widespread feeling of pity for this particular convict, who, if there is to be any capital punishment at all, would seem thoroly to deserve his fate. But then I have a strong impression that the whole story of the murder, which was read with deep natural interest by the public in general, served in itself to bring up the question whether there ought to be any death punishment inflicted in civilized society, and may in this sense have seemed to Mr. Gladstone to give an expedient and an emphatic occasion for taking a step toward a mitigation of our criminal code in that one of its provisions. I have always myself felt a strong doubt as to whether a Christian and civilized community has the moral right to inflict the punishment of death and whether the infliction of that punishment does really tend to diminish the number of the crimes against which it is directed. I feel quite sure that any course taken by Mr. Gladstone was the result of high and deliberate purpose and resolve, and not of any yielding to a sudden and sentimental clamor uplifted simultaneously thru various classes of English society and echoing day after day over the whole country. There was a report afloat for some days that Mr. Gladstone had resolved to give up the office of Home Secretary and take some other place in the Administration, but the report has thus far received no confirmation, and I sincerely trust that it may prove to be altogether unfounded. Mr. Gladstone seems to me to be qualified in most especial degree for the important office which he now holds.

The whole country is now intensely excited by the visit of the Colonial Prime Ministers, who are to be entertained by the Government at a great banquet in Westminster Palace, and are coming to this country for the purpose of holding a conference with the Government on the subject of the future relations between the Empire and the Colonies. All manner of entertainments are already prepared for them by institutes and associations here, and I observe that a special reception is to be given in their honor by Mrs. Herbert Gladstone. All the Colonial Premiers except one have already reached our shores, and are, I need hardly say, already visited daily by the interviewers from the newspapers.

To me, and I should think to most others here, the especially interesting figure among our visitors is that of General Botha, Premier of the Transvaal Republic. The time is not very far distant when General Botha was regarded as the mortal enemy of England and was seldom mentioned here but in language of detestation. That was in what have been more lately described as the Mafeking days, the days when a single victory over General Botha and his forces was the subject of as much exultation among Imperialists of all classes in England as if it had been another Waterloo. And now the Transvaal has become a self-governing republic, independent (except for the mere recognition of a nominal suzerainty) of any Imperial control on the part of England, and English Imperialists are now vying with each other in rushing to do honor to General Botha. I am not finding any fault with them for this sudden change of attitude, for indeed I think it is to the credit of the British public that it should do full and just honor to the man who won from England in fair and open battle the independence of his State, and who has proved that even with that independence practically secured his country can be a loyal member of the British Empire, just as Canada has ever been since her right to national self-government was acknowledged by England. But it must indeed be regarded as a memorable period in our history when General Botha is welcomed in London as a patriot and a hero and as the repre-

sentative of a State raised by its own courage and perseverance from a condition of mere subjection to be one of England's independent Colonial partners and allies in her great Empire.

I am sure it will be of deep interest to my American readers to know of the sincere regret felt among all reading classes in this country when the sad news came which announced the death of Thomas Bailey Aldrich. All the newspapers and literary journals of London and the English provinces, and of Scotland and Ireland as well, bore their tribute of admiration for your gifted poet and novelist and of sympathy with the loss which your literature has sustained by his death. I had the honor and the pleasure of knowing and of meeting often Thomas Bailey Aldrich many years ago during a prolonged stay in New York. I had always been a genuine admirer of his literary gifts, and the better I came to know him personally the more I admired his character, his intellect and his genial manners. I need hardly say that old memories were revived in me and were blended with deep feelings of sadness when I read in my morning newspapers the account of his death. The past, it has been well said, is always secure, and I shall ever carry with me the recollections of my acquaintanceship with Thomas Bailey Aldrich.

LONDON, ENGLAND.

A Challenge to Christian Laymen

BY THE GADITE

[Here is a practical problem of great importance to the churches of this country, presented in the unfortunate personal experience of a man of talents and devotion to his calling. If our readers can throw any light upon it we shall be glad to hear from them. Is this an exceptional case? Are his startling conclusions justified?—EDITOR.]

MY father was an ordained minister. For over half a century he served the Church with uninterrupted regularity. That service was also especially eminent, and particularly conspicuous for fidelity to evangelical doctrine, breadth of view and purpose, and the highest standards of right and duty. His life was one of unusual courage, liberal planning and actual achievement. He was heavily loaded with honorary degrees. As a theologian he was favorably known in two hemispheres. As a preacher he ranked among the most prominent of his day. As a writer and editor he did a voluminous work, chiefly in the religious press, weeklies, monthlies and quarterly reviews. He established and edited a periodical of his own that was widely read at home and abroad. As an author and translator his name will be found in any complete history of American literature. He was the honored founder of a college and theological seminary, over which he presided with distinguished success for nearly a generation. He was president of the highest judicatory of the denomination to which he belonged and was chairman of its General Board of Missions. In interdenominational assemblies he took a leading part. He inspired the consensus of a Pan-Presbyterian Alliance. Ministers thronged him. Laymen commended him and sang his praises in unmeasured terms.

But they were particularly careful to let him pay the freight! His constituents were "business" men, and shrewd, possibly considerate, for a minister and money make a dangerous mix—some think. Consequently, after almost six decades of continuous active service, and pinching poverty, when my revered and honored father died he left—a good name and a butcher's bill, probably another case of a minister's "improvidence" and lack of ability as a "business" man! Meanwhile, with a whole lot of cheap praise, his said lay brethren solemnly commended to me "the emulation of his noble example."

About twenty years ago, when I was not yet of age, my father, then a man of seventy, started me off for my first field of labor. My special preparation for the work had cost me full ten years, in-

cluding the academy, college and seminary. When I left home my father handed me my railroad ticket (I think it cost $2.25), one dollar in cash and some fifteen books. The last I put with some old clothes in a little tin trunk, and I launched out with high hope and earnest purpose, having persistently turned away from certain alluring and profit-promising pursuits.

This is not a romance. These are bald, hard facts. And they are worth the notice of the modern, money-making laymanship of the Christian Church, careful, calculating, shrewd, selfish. Moreover, they distinctly suggest one of the *real* remedies for the alarming decrease of candidates for the ordained ministry. For, after all is said, the dearth of such candidates is traceable largely to one source—the absence of conditions favorable to independence of thought, speech, action. I am fully convinced there will be candidates a-plenty when a redeemed, broad-minded, conscientious laymanship, now largely engrossed with the hot pursuit and selfish accumulation of things material, with barns bursting and contracts let for larger storehouses, alters its attitude of patronizing condescension and pauperizing toleration toward the ministry of the Church and returns to that ministry with a moral and financial support commensurate with what is expected of a well-bred, high-purposed, independent preacher of the Gospel, a support given, not as a pitiful charity, but as the payment of a first lien on all that that laymanship is and has.

My salary to start with was $550 a year. As I had six preaching points on a circuit of thirty miles, a horse and carriage were absolutely indispensable. The outfit, including harness, blankets, etc., cost me $300. I was allowed to pay for these essentials in "easy" instalments. This left me $250 net, or some 68½ cents a day for my services. For an American college-bred Christian man in these times! The vilest kind of illiterate contract labor from Italy or China will get more than that from these selfsame laymen. Out of my $250 per annum had to come my room rent, table board, stabling and feed for my horse, the maintenance of my equipment, my clothes, books, traveling expenses, etc. Among my parishioners were many well-to-do people. The field was within fifty miles of Philadelphia.

And God help the minister who fails to keep his "credit" good! For financial credit is ultimately the sole criterion that modern society, in the Church and out of it, goes by. Men are being judged by the commercial standards of Bradstreet and Dun.

A young mechanic serves but three years apprenticeship, and makes perhaps $2 a day; after which he earns full wages, say $4 to $5 a day, under comparatively inexpensive conditions. His is an eight-hour day. A minister's day is practically unlimited. The former has every evening to himself, all day Sunday and a half day Saturday, and he gets his wages in full every week for sure. A minister, however, rarely has a day or evening that he can freely call his own, and as a rule receives his poor pay any old time. During the period of his "apprenticeship" he earns nothing, but on the contrary is under heavy expense, where the other enjoys constant income.

My second field was in a city at $900 a year. It was a mighty advance. But I soon found that I was worse off than before. For to whom much is given much is required. During a six years' pastorate, however, I added some 220 to the membership, and when I left that church (formerly a very small interest) it owned $35,000 worth of real estate practically free of all incumbrance. It was a rich community and many really wealthy people were in that congregation. They simply covered me with words of praise and gave me a royal farewell.

When I moved to my next field of labor I had to borrow enough money to get out of that town! Probably due again to ministerial improvidence!

I now found myself in a larger city on $1,000 a year. I tried housekeeping. Two years, however, clearly demonstrated the fact that this was simply suicidal. I thereupon broke up my home, stored my goods, took my wife and baby and went to boarding in two rooms. To accomplish this I was compelled to borrow of a usurer $100 assigning my household goods as collateral. He charged me $10 "for the transaction" and 5 per cent. a month interest—a total of 70 per cent. per annum. But, God bless him! my

Israelitish pawnbroker was indeed a friend in need such as my ministry up to that time had not produced among all my Christian brethren!

Four years more and I was financially (and I feared mentally) bankrupt. My entire ministry had been as it has ever been, of hardest necessity, chiefly a struggle for existence. Sometimes I would receive no salary for three, four, or five months at a time, while my Board of Trustees included some millionaires and men of international reputation. My "credit" was gone. But what of that? They had carefully preserved *theirs!* My usefulness seemed on the verge of destruction. My future looked hopelessly dark. It was quite enough to drive an honest, sensitive man to—distraction. For days at a time I did not have a nickel for a car fare, or for a loaf of bread. All I had was the continued commendations of my lay associates. But praise makes pretty poor provender. And I was thirty-five years of age. Nevertheless I had succeeded in founding a church.

Five years have passed since then. At this writing I am surrounded by a people to whom I am warmly attached, as I have ever been deeply devoted to my calling. My orthodoxy has never been questioned. My ability and zeal have received the kindest consideration. My titles are more numerous than I can comfortably bear. My wife alone, however, easily earns, and before our marriage did earn, a very much larger salary than we now receive. As it is, in an expensive community, it is costing us at least $800 a year actual cash out of pocket over and above our meager salary for the privilege of doing this work, and we live with carefully studied economy.

Where in the name of Christian sense do people suppose that $800 is coming from? I was not fortunate enough to inherit it. I was not long-headed enough to marry it. I could not grovel enough to beg it. It has been utterly impossible for me to save it out of former pastorates. Where then is it coming from?

At forty years of age, when I am easily at my best (which is saying precious little), after twenty years of active service, during which time I have preached to some of the largest audiences in the United States, have addressed some of our greatest conventions of Christian workers (with balances always on the wrong side of my cash account), have written editorially for some of the leading religious journals in the world (all to no financial profit)—I am virtually down and out. How could it be otherwise on an average salary, in city work, of $1,000 a year?

Meanwhile the ministry—which develops the sentimental and sympathetic side of a man's character rather than the practical side, molds his life in certain fixt and "set" habits of thought and action peculiar to itself, and softens the edges of his being rather than hardens them for life's ordinary occupations—has no doubt largely unfitted me for any other pursuit. Moreover the rare "charity" of the Church generally taboos the "degenerate" minister who is honest enough to his creditors and fair enough to his family to seek a livelihood "on the side," beyond the narrow limits of his own special calling.

Some years ago a prominent gentleman said to me: "Young men should not enter the ministry from mercenary motives." Well, I want to say that the young man who enters the Protestant ministry of today from mercenary motives must be a fit subject for a lunacy commission. A man of ordinary intelligence with mercenary motives will never in the world enter the ordained ministry of the Protestant Church in these times; put that down as an axiom.

I tell this plain story from my actual experience for a single purpose. Constituted as I am it takes a whole lot of courage to tell it. But, however my motives for telling it may be impugned, I am entirely satisfied with their absolute sincerity. The present situation amounts almost to a crisis. The average man without an independent income has no business in the average Protestant pastorate. This Church is expecting entirely too much of its ministry. It is requiring us to meet five-dollar conditions with one-dollar pay, and then sneers because we fail. And these hireling wages are raised and paid under conditions that are not only humiliating to an intelligent man of great purpose and high spirit, but positively degrading and absolutely fatal to the best that is in him.

The Roman Catholic priest, with house free and no family to support, comes to the poor servant girl in our community and compels her to contribute (to my personal knowledge) from 20 to 30 per cent. of her annual income to the Church. I doubt if our well-to-do Protestants average 2 or 3 per cent.! The priest comes to his parishioners with all the authority of the Church back of him, and, without degrading himself or his office, literally commands adequate financial support. The Protestant minister must crawl up to his lordly parishioner like a belabored hound begging a bone, or, at best, he must pet him and nurse him and say soft speeches to him. No more of that for mine.

Talk about a revival? I tell you it is securely locked up in the fattening purses of our Christian laymen. Let these men begin to loosen up as they ought, and in the spirit of men who are simply paying an honest debt, and your long-expected revival will come over night.

But I know a representative Christian man who is making money rapidly, a very common, uncultured man, but nominally a Christian. He has some 2,000 employees, and he occupies a chief seat in the Church. His business nets him, we will say, $100,000. Of this he puts $80,000 into a new house for himself, and the rest, all but a pittance, he puts into expensive automobiles, pleasure trips to Europe and the like; the pittance, after some nursing, he throws at the Church, and imagines he has done God a service for which Gabriel himself should come down and crown him. He is one of many in these days of opulence, and the richest people in the world today are Christians and the meanest.

There is no use of beating about the bush for a revival or for a solution of the problem of candidates for the ordained ministry of the Protestant Church, or for a satisfactory answer to the question of world-wide evangelization. All these things may be found at once in an enlightened Christian conscience and a redeemed Christian purse. We may talk as we will about our prayer meetings and our conferences and our what not, the fact remains that the hearts of our Christian laymen are locked up with their cash boxes in the inmost recesses of their chilled steel vaults down at the Imperial Banking House of His Majesty Myself, and the millenium will not come until we break that bank.

Three things remain to be said:

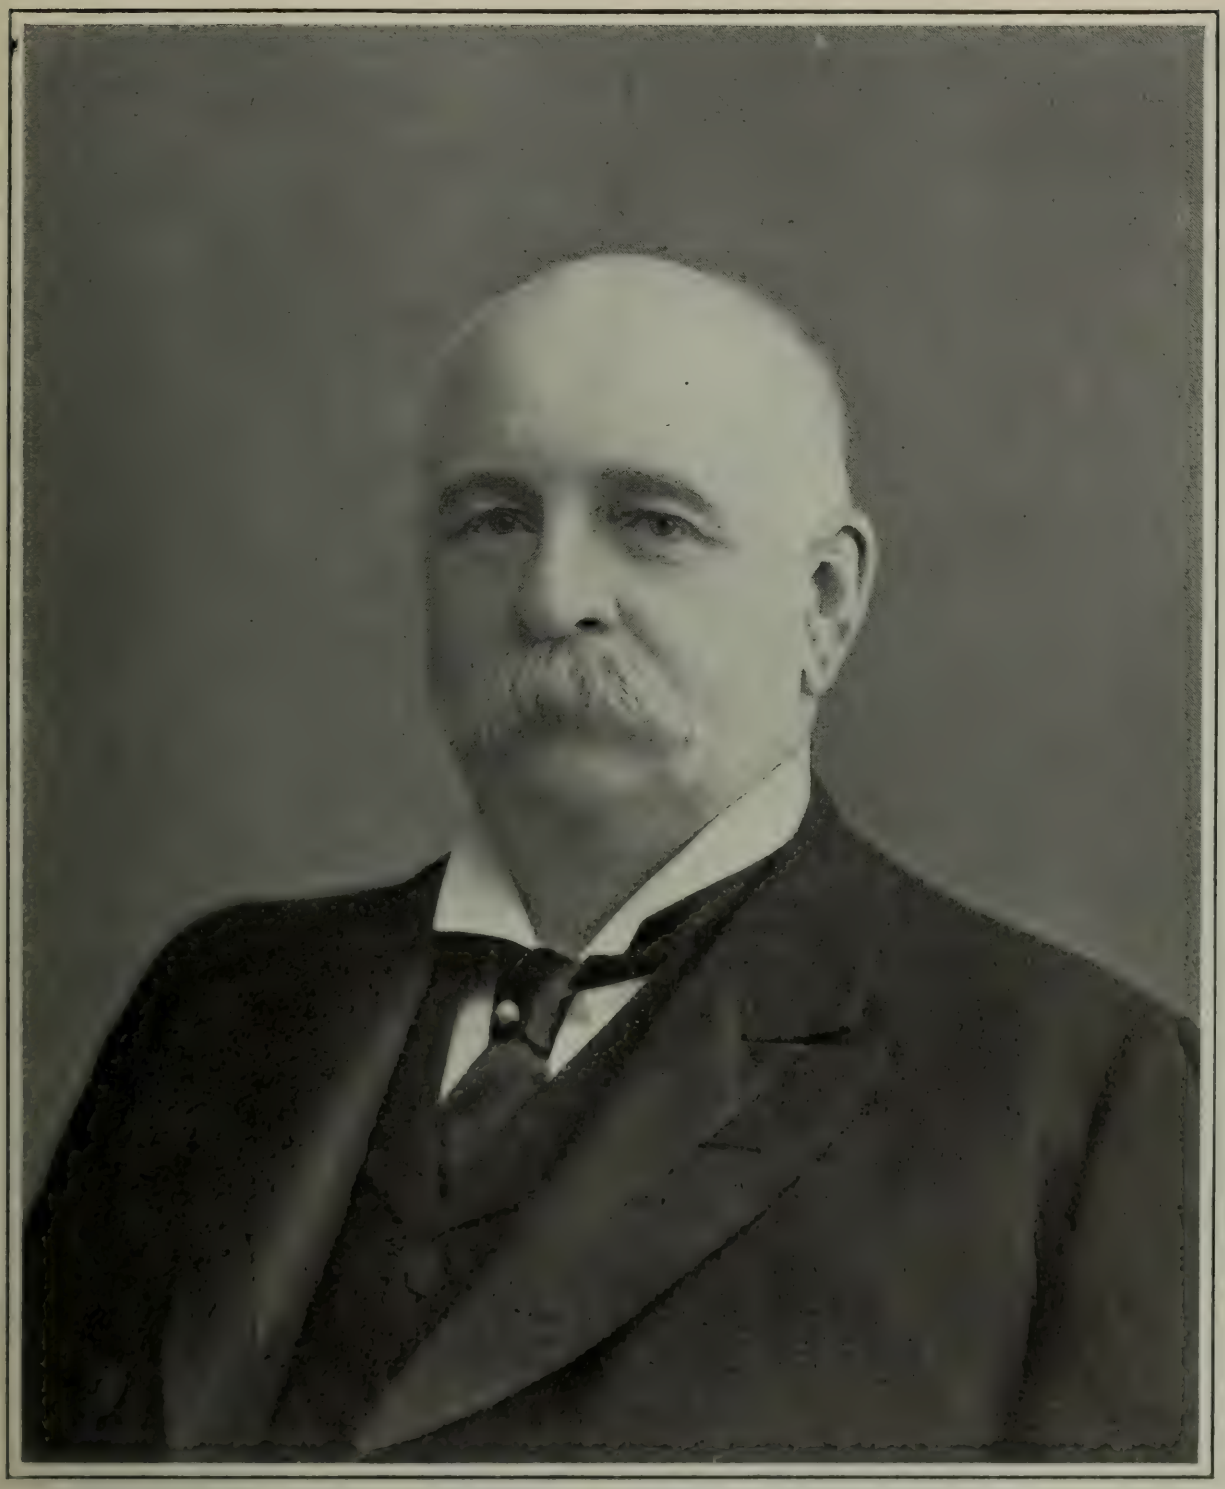
1. Never once in all my twenty years' ministry has the Church lived up to its so-called "temporal contract" with me. Never once. And when I say the Church I refer to men whom I have distinctly in mind, who pride themselves on their "rating," and who would not dare to treat their other creditors as they treat their pastors. And one day four years ago I wrote this in my diary: "It is my purpose henceforth to undertake no Christian work in which I am wholly and directly dependent on my Christian constituents for financial support." I have kept to that, and by the grace of God I mean to keep to it to the end.

2. For a calling I will preach the Gospel; it has been the joy and inspiration of my life. For a living I will — do something else, perhaps cobble shoes as Cary did, or make tents as Paul did.

3. I advise young men to take up the greater ministry of Christian work, more largely, more heartily and with deeper consecration than ever. But as to entering the ordained ministry of the Protestant Church as things stand today I say to young men, don't do it, until the laymanship of the Church wakes up to its duty in this matter of ministerial respect and support.

A Christian minister is measured and judged by the standards of the New Testament. But it is indeed a partial and one-sided judgment if the same standards may not be applied in the same manner to Christian laymen. Both should give life and purse to the spread of the kingdom, and with equal joy and consecration. Therefore converted Peter came with his little income and cast it wholly into the treasury. After him came the Merchant Prince with his large income and cast it wholly into the treasury. Thus they all came. Then they divided, for they had "all things common." But (I am forgetting myself) this is "rank socialism," and the standards of the New Testament are very much out of date—except, of course, as they apply to Peter. Alas! poor Peter!

The New President of the Chamber of Commerce



BY W. R. GIVENS

IF the financial world were asked to pass judgment upon J. Edward Simmons, the newly elected president of the Chamber of Commerce, it could and would say many pleasant and complimentary things of the man, his manner and methods, his work and his achievements, his genial personality and his unconquerable good humor. And the judgment would be a deserved one. But while this world and the larger world beyond the Wall Street bailiwick, where Mr. Simmons is by no means unknown, would say these things, there would be impressed one further and striking fact in connection with the Chamber's new president, viz., his absolute honesty and integrity. It is not alone that he is a shrewd business man; it is not alone that he is a far-seeing financier, whose judgment has stood the financial world in good stead in times of peril and of stress; it is not alone that he is a public-spirited citizen, ready at all times to put his shoulder helpfully to the wheel of progress; it is that whatever he does he does fearlessly, ably and well—and, above all, honestly. And in these times of corporate dishonesty, when the names of so-called "eminent financiers" are trailed in the dust (tho happily an awakened public conscience is "turning the rascals out" and relegating them to the shades of oblivion)—in

THE CHAMBER OF COMMERCE BUILDING, No. 65 LIBERTY STREET, NEW YORK CITY.

J. EDWARD SIMMONS.

these times it is a matter of congratulation and of pride to be able to point to an unsullied badge of honesty and to say: "There is a man." And that may truthfully be said of Mr. Simmons. In all the scandals that in recent months have affected and afflicted Wall Street; thru all the shocking disclosures of corporate neglect and corporate dishonesty, whether in "held-up" dividends or in the improper use of insurance moneys, not a breath of scandal has attached itself to the name of J. Edward Simmons.

A busy and a strenuous life has been Mr. Simmons's. Raised in the city of Troy and graduated in due time from Williams, the present president of which was his classmate, Mr. Simmons studied law and was finally admitted to the bar. The law, however, was not for him. The financial world drew him irresistibly to it, so that in due time we find

MEETING ROOM OF THE CHAMBER OF COMMERCE.

Showing the president's desk and portraits of the presidents and distinguished members of the Chamber.

him a member of the New York Stock Exchange and of the Gold Board, of which latter board he was not only a member on the famous Black Friday that engulfed so many men, but witnessed the stirring, heartbreaking scenes on the board on that day. A relatively few years later, in possession of a comfortable fortune, he retired from active business only later to be drawn into it again thru — for the business world, which otherwise would have been the loser—a happy combination of circumstances, as will presently appear.

Following his temporary retirement Mr. Simmons came again into public notice thru his activity and energy in Masonic matters, into which, with his ever-present zeal, he entered enthusiastically and earnestly. The result was a Masonic career that, to say the least, has been remarkable, and one of the most interesting in the country. Not only has Mr. Simmons taken every degree known in Masonry, but he has held practically every office, from the lowest to the highest—the latter the office of Grand Master of the State of New York, the largest Masonic jurisdiction in the world. It was while he was thus active in Masonry that his energy began to be directed in other directions—and began also to bring him more and more before the public eye and again into the notice of the financial and commercial world. First he appeared active in educational matters, in the beginning as a member of the Board of Education and later as its president, an office that he held for nearly a half dozen years.

About this time came the panic of 1884, carrying with it ruin to many. A. S. Hatch, of the firm of Fisk & Hatch, had been president of the New York Exchange in the preceding year, and but a few days before the panic had been re-elected to the presidency. The God of Fortune was for the moment against Mr. Hatch. In the panic his firm was among those to go down and at once Mr. Hatch resigned the presidency. A new election was necessary, and promptly the Stock Exchange Governors put up for the office one of their number whose name it is not necessary here to mention. The new nominee, however, was not acceptable to many in the Exchange, who wanted, in such trying times, a man at once strong and conservative. These objectors thereupon appealed to Mr. Simmons to allow them to place his name in nomination as an independent candidate for the presidency. He did so and was overwhelmingly elected, piloting the Exchange thru those dark days so happily and well that, his first term out, he was unanimously re-elected.

When, following the panic, normal conditions had finally been restored to the financial world, Mr. Simmons took a trip abroad for pleasure and for rest. Holding as he then held three of the most important offices in New York City that any man could hold—the Grand Mastership of the Masonic Lodge of New York State, the presidency of the New York Stock Exchange, and the presidency of the Board of Education—it is perhaps not to be wondered at that everywhere abroad he was cordially received and royally entertained. And here may be narrated a wholly new and unpublished story, but true notwithstanding, in which Mr. Simmons and the present King of England are the principal figures. The occasion was a banquet given by the London, England, Masons to Mr. Simmons, at which the then Prince of Wales, now King Edward VII, was present in his capacity as Grand Master. And properly to understand the story it may be mentioned—and it is violating no Masonic secret to tell it—that there are no politics in Masonry, nor is outside rank, station, title or position recognized. It was after the lodge had closed and while the members were making ready to go to the supper that had been prepared in an adjoining room, that Mr. Simmons noticed the members gathered about, talking earnestly, and looking first in his direction and then in the direction of the Prince of Wales. Finally, with much embarrassment several lodge members approached him, and, in halting and hesitating speech, endeavored to explain to him that they were in sore straits—that the question of precedence (often a troublesome one in England) was bothering them very much. Seeking to be further enlightened, Mr. Simmons had it explained to him that tho the Prince was the Prince Royal, he was, in Masonry, simply the equal of Mr. Simmons—

both being Grand Masters—and the problem was how to determine the order in which they should go into the supper room. The essentially democratic American Grand Master Simmons without hesitation proceeded to solve the difficulty. "I am a plain American citizen," said he. "It matters not where or how I enter or am placed." But Mr. Simmons had counted without his host. He did not know, he was soon to learn, that the Prince of Wales had also democratic ideas, for hardly had Mr. Simmons's decision been given when the Prince himself approached and in most friendly manner took Mr. Simmons by the arm and, arm in arm, marched him into the dining-room. Thus was the question of precedence happily disposed of—and in a way, probably, that has never happened to any other American citizen.

Upon his return from his European trip Mr. Simmons again got into harness, and began then to take a more active part in politics than ever he had taken before. In the latter part of the 80's he was prominently mentioned as the Democratic candidate for Mayor, and, indeed, if the inner facts were known of the political happenings that eventually terminated in the selection of Abram S. Hewitt as the Democratic candidate, and his election later, it would be found that self-sacrifice was not the least of Mr. Simmons's characteristics—was not then, as it is not now. The menace of the Henry George doctrine was then upon the land and Mr. Simmons was the first to realize it and to see that the strongest man under all circumstances—regardless of all personal promises—should be put in nomination to save the day. But that has ever been a characteristic of Mr. Simmons. The office has always sought the man, not the man the office. It was so in his nomination as president of the Stock Exchange, it was so as president of the Board of Education, it was so later when he became president of the Clearing House, and it was so the other day when he was elected president of the Chamber of Commerce. But it was strikingly so when some twenty years ago he was chosen president of the Fourth National Bank, a position which he fills today. It is a fact, not a fiction, that when he was elected to the bank presidency he did not know a single director personally. He was known to them only by reputation as a conservative, sane, safe, honest man; and that was the kind of a man they needed. Hence his choice—a choice that has resulted so well for the bank that from its then relatively modest position it has risen to its present power and prominence. The figures issued just two weeks ago, showing the condition of the bank, bear eloquent testimony to this fact. In resources they show as follows:

Discounts and time loans, $10,102.819.51; United States bonds to secure circulation, $50,000; other securities, $228,452.44; banking house, $1,000,000; gold, $3,551,861; legal tenders, $1,595,100; due from United States Treasurer, $39,000; five per cent. fund, $2,500; due from banks, $2,326,535.63; exchanges, $6,048,657.54; demand loans, $7,814,102.32; while in liabilities they show: Capital stock, $3,000,000; surplus, $2,000,000; profits, net, $1,166,580.24; circulation, $19,500; due depositors, viz., banks $13,703,011.28; individuals, $8,796,568.50; deposits for acceptances, $4,043,368.42.

This résumé shows all too briefly, but none the less conclusively, the all-roundedness of the man and his thoroly representative character—representative of the banking interests as head of the Fourth National Bank; representative of the security interests as one-time president of the Stock Exchange, as one-time president of the Clearing House and as the present acting chairman of the Clearing House Committee in the absence of James Stillman, president of the National City Bank; representative of the educational interests as one-time president of the Board of Education; representative of the mercantile and commercial interests as president of the Chamber of Commerce. Nor is this all. He was at one time president of the Panama Railway; he is today a director in a dozen or more corporations; he is trustee of the New York Hospital; he is an active worker in St. Thomas's Church, and he is one of the Water Commissioners to see that the city shall have pure water, chosen by Mayor McClellan, after having first been nominated for the place by the Chamber of Commerce, whose president he now is. A truly busy, all-round man, indeed!

So much of the business side of Mr. Simmons. What of the man himself? The answer lies in the simple statement that in a world where enemies are easily

made and where enmity lasts long—Wall Street—Mr. Simmons is universally esteemed and respected. The number of those who speak well of him is legion. He may have enemies, but if he has the writer of this article has not been able to find them. A well set-up, well-preserved man, in the sixties, smiling and affable, with a ready twinkle in his eye and a good story always available, he is popular wherever he goes. He is slow to anger, and patient, very patient; but once roused he is a vigorous and aggressive fighter—tho a fair one. Unlike many other of Wall Street's leaders he is readily accessible and lends a responsive ear to the trials and tribulations of others. Without parade or blare of trumpets he does much in a charitable way, nor is he desirous that a curious world shall know of it, content merely in the doing; and, the day's work done, he is satisfied to go to the quiet of his home and enjoy himself sanely and peacefully, untempted by the glitter of society. His one hobby, if he has a hobby, is his love of horses. He is a great reader of light as of heavy literature, and is reckoned one of the best-read, best-posted men in the higher walks of Wall Street. Last of all he is of the sane and conservative school in all things, which may account for the honored name he bears and the high offices he holds.

NEW YORK CITY.

Triumph Song of Life

BY NATHAN HASKELL DOLE

THO the Winter the face of the Meadow may freeze,
Tho the leaves may all fall from the sorrowing Trees,
Tho the fountains may cease and the Rivers be bound,
And the Snow may lie deep on the bloom-widowed ground,
Death may rejoice,
But the World shall awake at the Spring's thrilling Voice!

Tho the Worm may live only the brief Summer hour,
Tho the petals be blown from the heart of the Flower,
The Butterfly floats from the chrysalis left,
And the Fruit grows in place of the blossoms bereft.
Death gets no prize,
For a new grace is born when the old Beauty dies.

Tho the Babe may be torn from the Mother's fond arms,
Tho the Maiden be lost with her sweet budding charms,
Tho the Youth, howe'er strong, howe'er gallant and brave,
May descend, in spite of his pride, to the grave,
Death nothing wins,
For a new Life forever with dying begins!

And tho cities may perish and nations consume,
And tho stars rush together in flame to their Doom,
It is only a part of God's marvelous plan,
And his Love rules the world from the atom to Man.
Death is no foe,
It is only thru Death that the new orders grow!

'Tis thru Death that Life lives: both are servants of God,
And the path thru the Vale of the Shadow when trod
Leads to measureless fields of fine Service afar,
Where there's no loss of Love or of Friendship to mar:
Death brings the gain,
And the infinite joy shall atone for the pain!

BOSTON, MASS.

The Trials and Humors of the "Chair"

BY FRANCIS E. CLARK, D.D.

President of the United Society of Christian Endeavor.

THE trials of a presiding officer at large conventions are not always appreciated by the audience, and a sense of the undoubted humor which the situation often develops does not always come to his relief with sufficient force to make him enjoy his task.

A presiding officer's chief trials come from long-winded speakers, who never know when they are thru, or when their audiences are thru with them.

Not always, however, is the prolixity of the speaker chiefly to blame, but rather the unwisdom of the program committee, that has crowded three speeches into a short evening where there ought to be two, or two where there should be only one. But the result is very much the same from the chairman's point of view, for he is responsible for keeping the meeting within its bounds, and closing at the appointed time.

When a speaker has reached the limit of his time assigned on the program, the chairman begins to grow nervous; when he has passed it by five minutes he begins to perspire; when he has exceeded it by ten minutes he grows desperate, and either gently pulls the speaker's coat tail or sidles up behind him and whispers in his ear that his time is up.

Even that does not always have the desired effect, for I have known a speaker to go on and on and on, after repeated warnings, until the chairman, growing thoroly desperate and reckless of consequences, stands boldly up and announces that it is time for the next speaker.

Undoubtedly the best way of curbing a speaker's rhetoric in a very large audience is that adopted at most great young people's conventions, to have a timekeeper with a hidden bell or "buzzer," who shall ring his warning signal two minutes before the expiration of the speaker's time, and again when the last second allotted to him is exhausted.

This timekeeper usually sits in a row of seats on the platform with a number of others, and as the electric button which he rings is inconspicuously placed under the seat of his chair it can be rung without attracting any attention and without the speaker himself knowing who is keeping such strict watch of his time.

This comes as near being an impersonal and automatic check on a speaker as anything that can be devised, and if the warning note is sounded by a "buzzer" placed directly under the speaker's desk, so that it is heard by few besides himself, not much in the way of a discourager of fluency is left to be desired.

But even this carefully designed plan does not always work. At one convention I recall an earnest and persuasive Scotch speaker, who had come across the seas to address a great American convention numbering tens of thousands. In the midst of one of his most eloquent periods the "buzzer," which was directly under the rail on which he laid his hand,

sounded its two-minute warning. Whereupon he grasped the nettle firmly in his strong right hand, and held it there until his speech was finished. He has since been subjected to much chaffing on the part of friends, as "the man who captured the buzzer," but he has always stoutly declared that, being a stranger to the country, he did not know what that "Yankee contraption" was for, or what it was buzzing about.

Not always, however, do the speakers take the cutting short of their eloquent periods so good-naturedly. On one occasion I recollect an orator had been rung down two or three times. Other speakers equally eminent and eloquent were to follow him. The session must close at the appointed minute, as other important exercises were to follow. Five, six, seven minutes passed, and still he showed no signs of coming to the peroration. The program was getting hopelessly behind time, when the chairman rose and insisted that the speaker should give place to the next on the program. But the orator never forgave the chairman for doing his duty, but attacked him virulently on the platform and in the press again and again, with as choice and varied an assortment of invective as can be heard outside of Billingsgate.

Not very often, however, is this the result of a chairman's insistence on following the program. Usually the speaker takes the curtailment of his address with great good nature, and often turns the interruption to his own advantage with the audience.

A few months ago as I was attending a large meeting in Liverpool, the presiding officer became nervous, and gently pulled the coat-tail of the vivacious and witty speaker, but did it so deftly that no one in the audience, and only a few behind the speaker on the platform noticed it. But he, in no wise abashed, gathered his coat-tails into one hand, thrust them back at the chairman, saying, good-humoredly, "pull it as hard as you please for I am almost thru."

At other times I have known a speaker to stop in the middle of an eloquent sentence to take his seat when the warning bell rang, and thus win great applause from the audience who always appreciate not only a short speech but good-natured acquiescence on the part of a speaker, and his willingness to give the next man on the program what they would call a "show."

Occasionally, however, an audience takes the bits in its teeth, so to speak, and attempts to run away with the meeting, which greatly adds to a chairman's trials.

Especially is this noticed when a fair singer has captured the popular ear, and the audience, in an Oliver Twist frame of mind, demands "more." But an encore takes the time of a program as well as a long-winded speech, and, when the minutes for each part are closely counted, it is impossible to let the audience have its way or as many encores as it desires. Sometimes I have had to stand for three minutes, gavel in hand, between a vociferous audience and the singer who was as eager to sing as all were to hear her, in justice to the following speakers, and to prevent the program from becoming hopelessly swamped.

In ninety-nine cases out of a hundred, however, the audiences are as reasonable and as good-natured as the speakers, and a few words of explanation from the chairman, appealing to their sense of fairness, puts the audience in good humor again, even if the singer, who has missed an encore, is not so well pleased with the chairman.

One of the most amusing incidents from behind the speaker's desk which I ever witnessed, occurred at a great convention on the Pacific Coast. A dusky Hindoo was the speaker. The man was glib and ready and spoke excellent English, and had a message which he was bound to deliver. He was assigned twenty minutes on the program, which, under the circumstances, was an ample allowance. When the twenty minutes were exhausted, the bell was rung, but he paid no attention to it. Again, it was rung but he was as oblivious as before. Again and with the same result. The chairman rose and whispered in his swarthy ear, but the warning fell on an unheeding tympanum. Five, ten, fifteen minutes of the next speaker's time went by, when the secretary of the society, who sat by the distracted chairman's side, went boldly up to the little Hindoo, gathered him into a capacious arm, and set him gently down

in a chair that had been pushed conveniently near, while the audience, who had noticed the chairman's perplexity, roared with laughter.

The whole thing was done so deftly and with such good-natured compulsion, and it was so evidently the only thing that could be done to save the morning's program, that the speaker himself, who was not destitute of a saving sense of humor, took in the situation, and laughed as heartily as any one in the audience.

Odd mistakes sometimes happen to the presiding officer of a convention. On one occasion such an officer was following with interested attention the speaker of the day and joining in the liberal applause which he elicited. At length the speaker put his argument in a way so convincing and so exactly expressive of the chairman's own views, that he applauded with redoubled vigor. "I am glad," said the speaker, turning to the chair, "that our president so cordially approves and heartily claps these sentiments, for they are his own words which I have been quoting from one of his books." The chairman blushed a rosy red, and subsided behind his program to meditate on the inconvenience of having such a good "forgettery" that he could not remember his own writings.

On another occasion a large Christian Endeavor convention in the early days of the movement was being held in Saratoga. Many eminent people, who were sojourning at the Springs, besides the regular speakers and delegates, dropped in to attend the services. One evening it was whispered to me by a friend, who I supposed was well posted on the celebrities of the day, that Dr. S. F. Smith, the author of "America," was upon the platform, and he pointed out an aged and thoughtful-looking man who sat upon the back of the wide platform. Of course I felt that the young people should have a chance to see and greet the distinguished poet, and it was agreed that when he rose to speak, if he could be prevailed upon to do so, it would be a pleasant recognition if the audience should spontaneously break out with:

"My country, 'tis of Thee,"

Word was passed along from person to person, and all on the platform, at least, were on the *qui vive* of expectation. I went over to the aged veteran and whispered in his ear, "Dr. Smith, will you not say a few words to us? The Christian Endeavorers will be delighted to hear you." The old man looked bewildered, indeed almost dumbfounded, for a moment, and then slowly, in a wheezy voice, ejaculated, "My—name—ar'n't—Smith. I'm — Deacon — Higgins — from — Jonesville." Needless to say, I did not press the invitation, but apologized for the mistake, and got back to my seat a somewhat sadder if a wiser man.

I would close these reminiscences, which might be extended almost indefinitely, with a word of cordial appreciation for audiences and speakers it has been my good fortune to see and hear in many parts of the world. Courtesy, consideration, good nature, forbearance with the presiding officer, and thoughtfulness for others' feelings, have been the rule, on the part of both audiences and speakers. The reverse of these traits has been the rare exception. Speakers everywhere as well as chairmen have reason to thank their audiences for the interested attention which is more even than eloquence in promoting a good convention, and audiences have perhaps equal reason to pass a vote of thanks to their speakers with the sentiment of old Edmund Waller's couplet in mind that orators like:

"Poets lose half the praise they would have got,
Were it but known what they discreetly blot."

AUBURNDALE, MASS.

Literature

The Race for the Poles

THE Polar regions, which have yielded so many fine crops of narrative, have an unusually important season this year. From the Arctic regions there are the narratives of Commander Peary and Mr. Fiala, besides historical works by General Greely and J. Douglas Hoare. Moreover, a few copies of Dr. Charcot's story of his Antarctic expedition have reached this country, and doubtless we shall presently have a translation of it.

LIVINGSTONE GOLD MEDAL OF THE ROYAL SCOTTISH GEOGRAPHICAL SOCIETY, EDINBURGH.
(Awarded Commander Peary.)

HUBBARD GOLD MEDAL OF THE NATIONAL GEOGRAPHICAL SOCIETY, WASHINGTON.
(Awarded Commander Peary.)

Of these books, Commander Peary's[1] is, of course, the most important; in fact, for American readers it is the most important book on Arctic exploration that we have had for many years. It narrates the most eminent exploits of the most eminent living Arctic explorer, and one of the most eminent Arctic explorers that has ever lived. And he is an American, and made the farthest north by what is called the "American route." It is a straightforward story of indomitable courage and unswerving perseverance, told in a straightforward style, with few metaphors, enhanced very little by poetic thought. Commander Peary is not half a poet, as Nansen is, but Commander Peary has had hardly the time for poetic imaginings; he has worked too hard. His adventures have come too thick to need, for literary purposes, the decoration of a chaste style

[1] NEAREST THE POLE. *By Robert E. Peary.* New York: Doubleday, Page & Co. $4.80.

or poetic appreciations. The bare narration of them is interesting enough.

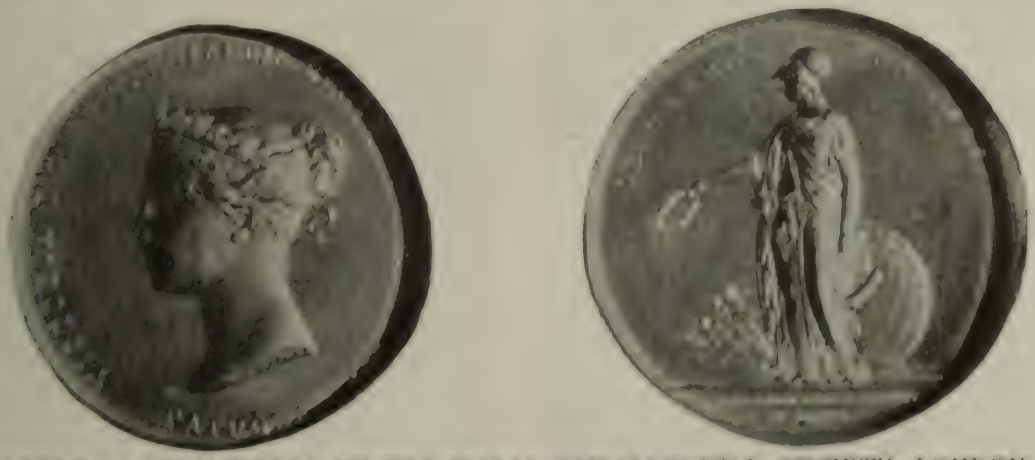
The main part of the book is taken up with an account of his expedition of 1905-06; the account of how he and the "Roosevelt" battled their way thru the tide-swept ice floes of Robeson Channel to the mooring place further north than any vessel had ever reached in this hemisphere, and how he and his Eskimos and other companions—mainly seamen—trudged their way and hauled their sledges to the point nearest the Pole which has ever been reached by man.

GOLD MEDAL OF THE PARIS GEOGRAPHICAL SOCIETY.
(Awarded Commander Peary.)

The outlines of the story have already appeared in the public press; the long, exasperating delay at the border of an impassable lead of open water; the second and crucial delay thruout the storm which kept the explorers imprisoned in their igloos for six days just at the critical point; the second encounter, on the return journey with an open lead; the crossing of the lead on ice so thin that it undulated before explorers and sled; the rations of dog—of which Commander Peary does not complain, "if only there is enough of it"; the return to Greenland to a point which Commander Peary himself had discovered and at which he knew he could find food enough to last out the journey back to the ship; all these dry facts have been made widely known.

The writer has erected the dust of them into living things—has supplied a heart and soul for them, so to speak. The heart and soul are the commander's own. He was evidently the heart and soul of the expedition, and he is the heart and soul of the book. His own character is fully revealed in it; a character redundant with energy and self-reliance, humanized, perhaps, by some of the minor weaknesses which usually go with forceful natures. He indicates them quite simply, and the indications often give a picturesque value to his story. For example, he has his little superstitions; he likes to feel that the "Roosevelt," in her final mooring, was pointed due north and that the glow of the light from the galley window, "the eye of the 'Roosevelt,'" which shone night and day thruout the sunless Arctic winter, pointed due north.

That he should assume that this region is his region; that he should talk about his discoveries as "my new domains," and that he should refer to the Eskimos as "my children" is but natural. Even in the portion of the country where he was not a pioneer he has made explorations in detail and has corrected the mistakes of his predecessors. He has made himself a master of Arctic travel, so that he ventures forth at seasons of the year when most of his predecessors have been contented to remain in their headquarters. He has learned the use of the Eskimos as aids, and has attached the tribe to him so that they are willing to follow him out upon the ice pack where the devils live; and any one who has not seen the Eskimo tribe cannot realize the extraordinary ascendancy over these people which such confidence implies.



He must have collected a considerable store of information about this tribe, and one is rather inclined to suggest that he might have given more of it in his chapter on the Eskimos, which is in part a résumé of the chapters in "Northward Over the Great Ice." There are many persons who would have liked to have an Eskimo vocabulary instead of the census

of the Eskimo tribe, which appears in both books.

Not only the account of his most recent expedition, but also the accounts of the expeditions from 1898 to 1902, when he was constantly in the North, appear in this volume; one achievement follows another with telling effect. It is a most inspiring book.

Mr. Anthony Fiala's account of his attempt to reach the North Pole in 1903-05[2] is the work of a man with a mission—a man energized with the desire to see the North Pole achieved. Perhaps it is not quite fair to describe the explorer as an apostle and organizer rather than a narrator, for there are passages in his work which do not lack dramatic interest, and certain of his adventures have suggested to him telling phrases; as, for example, his appreciation of the "passing of the soul" of his ship in the moment of destruction; his context makes the image vivid. But he is less concerned with the poetry of the Arctic region than is, for example, Nansen, or with the picturesqueness of it than were Kane and Hayes, or with the mere story of daily life in the Far North than have been most Arctic explorers; his thought dwells mainly on the ways and means by which he hoped to reach the Pole, the reasons for their failure, and the improvements that might be made in them. His experiments and suggestions—the use of ponies to supplement dogs as draft animals, for instance, the classification of stores, and particularly his hints as to the choice of members of Arctic expeditions—cannot fail to be discussed wherever there is interest in Arctic affairs. In fact, he has produced one of those books that ought not to be overlooked by an aspirant for the leadership of a Polar expedition, even altho his own efforts ended in defeat; a defeat due partly to one of those bad seasons that baffle explorers who think to rely on the lessons suggested by the experiences of predecessors, together with a lack of stamina in certain members of his party; partly—Mr. Fiala refuses honorably to gloss over his own share in the mistakes of the expedition—by a maladjustment of the sledges to the hauling power of ponies, and, finally, to the leader's own humanity; he gave up his last desperate attempt to make the furthest north because he could not feel sure that those members of his party who had abandoned the enterprise would not need his team of dogs for the transportation of provisions to their camp. Mr. Fiala's assistants make only a meager report of the scientific work of the expedition; possibly a more comprehensive statement is to be expected. Mr. Porter, however, contributes a brisk account of a sledge journey, which seems likely to be, to the general reader, the most attractive passage in the book.

Mr. J. Douglas Hoare[3] has written another of those summaries of the history of Arctic exploration which appear every once in a while. It is not quite as comprehensive as the revised edition of General Greely's standard work on the subject, which has already been re-

[2] FIGHTING THE POLAR ICE. *By Anthony Fiala.* New York: Doubleday, Page & Co. $3.80.

[3] ARCTIC EXPLORATION. *By J. Douglas Hoare.* New York: E. P. Dutton & Co. $3.00.

viewed in these columns, tho it does include a few of the earlier explorers whom General Greely has not thought worthy of mention. The accounts of the expeditions, however, are given in somewhat more detail than those in Greely's book, and the work certainly has a place among those readers who have not the original narratives at hand. It also fills a place, because Mr. Hoare has chosen in the main the chronological method of arrangement of the expeditions, whereas Greely and Markham have chosen the method of arrangement by routes—a very good method, but it is as well to have both. The book contains an excellent map.

Dr. Charcot[1] has written an account of his experiences in West Antarctica in 1903-05, one of those sympathetic narratives which are to be expected from Frenchmen—dwelling upon atmospheric effects, picturesqueness of scenery, characteristics of comrades; a book of life and impressions rather than of hard work. That he and his expedition accomplished hard work, however, is apparent by the highly finished scientific reports—reports such as are to be expected from European investigators, and such as we rarely have in American Polar narratives of today.

The Catholic Encyclopedia

THE *Catholic Encyclopedia**, of which the first volume has just appeared, is designed to give an adequate and authoritative statement of the Catholic Church's doctrine, history, spirit and institutions. This purpose, as the preface declares, will be pursued with a twofold method: On the one hand the articles will be concise enough to appeal "to the man of action"; and on the other, they will possess "the accuracy that satisfies the scholar." And over and above all, the editors assure us, the Encyclopedia will present "the whole truth without prejudice, national, political or factional." Introduced by these praiseworthy and noble words, the first volume of the great undertaking is now offered to the judgment of English-speaking students and scholars. Heartily sympathizing with the motives that prompted the work, and sincerely wishing that it should be creditable to the mighty Church which it represents, we propose to examine this volume briefly, from the standpoint of impartial scholarship.

Many of the articles display a fine, discriminating erudition and a scientific temper which is beyond praise. Some of the biblical contributions are almost perfect in this respect, fairly outlining both the traditional and the critical view, and abstaining from any undue emphasis of the former to the prejudice of the latter. The articles on Abraham and Adam, for example, will delight all open-minded students of the Bible. In some of the historical articles, too, the same scientific impartiality is manifested. We would select as worthy of particularly honorable mention the papers on Alexander VI and Adrian IV. Among the philosophical articles, which occupy a prominent place in the volume, the study of Agnosticism is especially keen and unusually well written. Another type of articles in which the Encyclopedia appears to advantage are those of a geographical and statistical character. It would be hard to find in any other work the information regarding Christian missions which is contained in the articles on Arabia, Asia and Africa.

From these words of commendation we regret that we have to turn to criticisms that are not so pleasant. Unfortunately, several of the articles are egregiously one-sided; some others are conspicuously incompetent, and a few display such violations of a sane and critical spirit that we could hardly believe our eyes when we read them. The writer on the Albigenses omits noticing Innocent III's savage and bloodthirsty orders for the repression of this sect, and by the words, "Innocent counseled moderation," he leaves in the mind of the reader a view of history which is not true. The author of the article on the Armada glosses over the Pope's co-operation with that expedition, and ignores the antecedent Papal deposition of Elizabeth, which constituted the Papacy a deadly

* THE CATHOLIC ENCYCLOPEDIA: AN INTERNATIONAL WORK OF REFERENCE ON THE CONSTITUTION, DOCTRINE AND HISTORY OF THE CATHOLIC CHURCH. In fifteen volumes. Volume I. Aachen—Assize. New York: The Robert Appleton Co.

menace to the liberties of England. Of Antoine Arnauld we are told that his attacks on Jesuit moral theology were based upon prejudice and credulity, and there is not a word to let us understand that many of the purest and most enlightened men of that and succeeding times cried out with equal vehemence against the excesses of laxity into which casuistry had fallen, excesses which later Popes had to condemn as subversive of morality, and which Thyrsus Gonzalez, General of the Jesuits, sacrificed his peace and risked his office to oppose. The statement as to Vergilius, whose opinion that men lived at the antipodes was severely condemned by Gregory II, flies in the face of Gregory's own words in dismissing the matter merely as "an incident in the imaginary warfare of science and theology." Yet the author of the article, with a hardly credible inconsistency, concludes by warning Catholics that the Vergilius episode, "like the parallel case of Galileo," is "a solemn admonition against a hasty resort to ecclesiastical censures." The extensive study of Absolution, while containing much that is good, is seriously defective. It does not discuss the vital question whether in the early Church absolution was not merely reconciliation with the body of the faithful; it absolutely ignores Jerome's classic exposition of Matthew xvi: 19, which, directly, formally and decisively denies the absolving power to bishops and priests, and it makes no mention of Gratian's words, which practically repeat in the twelfth century the opinion expressed by Jerome in the fifth. The article on Antichrist has made no use of modern research on this subject, and refers to the great scholar, Hermann Gunkel, in language which will make the judicious grieve. With this article the one on Asmodeus may well be yoked for incompetence and unfairness. The sketch of Arianism states, without condition or limitation, that, from the beginning of Christianity, Catholics had always maintained that Christ was truly God. Certain famous texts of Justin, Origen and Tertullian might well have stayed the reverend author ere he set down so intemperate a proposition. The long article on Asceticism, we are bound to say, is utterly unworthy of that important subject, and is so chiefly because the author seems to be totally unacquainted with the science of comparative religion. To "pagan asceticism" he devotes five lines! and they contain almost as many ludicrous errors. The article gravely says that the Nazarites of the Old Testament took their vow in order to edify and reprove the self-indulgent Canaanites—a statement that makes one ask if this is really the twentieth century. Finally, some of the articles on the saints are rank with inconceivable superstition. To say that a ray of light frequently darted from a picture of the Virgin upon Alphonsus Liguori while he was preaching; that Anthony of Padua was simultaneously delivering a sermon and chanting a lesson miles away; that the same saint, about whom not twenty lines of authentic history can be written, preserved from getting wet a servant who was returning to the monastery in a heavy rain with vegetables for dinner; and that the sea formed a protecting wall of water about Father Anchieta at his prayers—to put this sort of medieval rubbish into a serious work which aims at giving the people of this age a favorable view of Catholicism is a procedure which we cannot pretend to understand. To make an end of criticism, we regret that nearly all the Hebrew words are wrongly printed (three wrong of the five given for *Adonai*), one of many indications of incompetent editorship.

We may sum up our estimate of this volume by saying that it contains specimens of as fine work as could well be done; it gives a great deal of highly valuable information; but it is thickly blotched with unfair, antiquated and mediocre material.

Recent Books on Italy

How vital is Italy's hold on the interest of civilized men! And deservedly so: for Italy appeals thru her history and her romance, her art and her antiquities as no other country can. Her experiences have touched the rest of Christendom at every point. She has had passions, exaltations, failures which posterity would share vicariously. And as the modern fashion in these things changes every decade or so, the romancers and

historians turn back to see how the Italian prototypes look in the new light.

Latterly, the Renaissance has had the cry and the three books we have under consideration are all concerned with that period. The first, on *Sigismondo Malatesta*,[1] is the most pretentious of the three, but it has the fatal defect of being a humbug. Mr. Hutton pretends at the outset that he has merely translated the contemporary chronicle of Pietro Sanseverino; and at the end of the book he confesses that there was no Sanseverino nor Italian original, and that he resorted to that dodge (the word is vulgar but exact) in order to make his "study" seem more life-like. So we have a product that is neither history nor romance, something that historians will not read because they must regard it as fiction, while novel readers will avoid it because it advertises itself as history. In his attempt to be too clever Mr. Hutton has overreached himself. He would have done better to write a straightforward romance, using his material as Mr. Hewlett uses the personages and setting of the Renaissance; or to have put his facts into a well-ordered biographical study. We see plainly that Mr. Hutton has honestly searched high and low for his material; that he has tried to saturate himself with the feelings of the time; that he has visited every place and gazed on every building he describes. It is equally plain that no real chronicler of Malatesta's epoch would write as he writes, or think as he thinks. As to the accuracy of his pages — who cares? since the reader can never know whether any particular passage be fact or fancy. The waste of time that might have been valuable and of interesting material is so obvious as to leave the reviewer with a sense of pity for the misguided author. But a word of hearty praise should be said for the illustrations, which are genuine, well-chosen and well-executed.

Mrs. Champney's beautiful book on *Italian Villas*[2] is not open to the same censure, because she resorts to no pretense of giving an authentic historical document. She tells the stories and legends connected with a dozen or more famous pleasure places, and she uses such artifices as are proper to a story-teller to make his narrative vivid, but that is all. Here are Vittoria Accoramboni—"The White Devil"—the Medici and the Tornabuoni, Jacopo della Quercia and Ilaria del Carretto, Pia dei Tolomei, Countess Matilda and Sordello and many more *dramatis personæ* to act as heroes and heroines in Mrs. Champney's twice told tales. She writes with verve, communicating to her reader the charm she feels herself. The views of the villas and gardens are a delight.

Vittoria Colonna[3] was among the most fortunate of women. Not a genius, she inspired the devoted homage of one of the mightiest geniuses the world has ever seen, sincerely pious in an age of irreligion, virtuous in a society which scoffed at virtue, a poet of no mean ability, a steadfast friend, she had the best that life affords while she lived, and she has been held in sweet remembrance for more than three centuries and a half since her death. Mrs. Jerrold has made a biography of her which is exhaustive and discriminating. The Marchesa's life was on the whole internal rather than external, so that it does not furnish many incidents. Mrs. Jerrold has done well, therefore, to bring on the scene her friends and contemporaries—Michael Angelo, of course; Veronica Gambara, Ochino, Gaspara Stampa, Isabella d'Este, and a throng of nobles and prelates. She gives us specimens of Vittoria's poems and of Veronica's, with well-chosen extracts from letters of the time. Altogether, a book to be recommended, and to be enjoyed. Like the two preceding, it has some excellent illustrations.

The Thirty Years' War

THE world's urgent need of a great historian, possessing the genius, the desire and the determination to rewrite the history of its modern eras as it should be written, is apparently not on the road to fulfillment. He may be laboring even now over the task of a lifetime, but if he

be he keeps the secret of his gigantic undertaking well to himself, dooutful, perhaps, of ultimate success. Meanwhile the science of history struggles along as best it can with a collaborative halfway measure of monographs, one of the most satisfactory of whose products is, no doubt, the *Cambridge Modern History*, planned by the late Lord Acton, whose fourth volume now lies before us.

No less than eighteen students have contributed the contents of the last bulky volume,* which, chronologically the fourth of the series of twelve, is the fifth to be issued, Vols. I, II, VII and VIII having preceded it. The three editors—Messrs. A. W. Ward, G. W. Prothero and Stanley Leathes—are well represented, notably the first, who has written seven of the twenty-seven chapters, dealing with the Seven Years' War proper and with the English Commonwealth and Protectorate. Mr. Leathes has furnished two chapters, on Richelieu and Mazarin; Mr. Prothero also two, dealing with the early years of the Civil War in England, and two more on other phases of its history, in collaboration with Col. E. M. Lloyd. Among the other contributors may be mentioned Mr. Horatio F. Brown, with an important monograph on the Valtelline; Prof. C. H. Firth, on "Anarchy and the Restoration" in England; Col. Martin Hume, who writes of Spain and Spanish Italy, of course; and Prof. Emile Boutroux, of the University of Paris, to whom has been entrusted the study of Descartes and Cartesianism, with which the volume closes.

The period covered is that from 1530, when the Grey League obtained possession of the Valtelline, till 1670, the year of the death of Mazarin, who carried out with unfailing subtlety the policies laid down with overriding force by his predecessor and master, Richelieu. The title of the volume, against which protest has been raised by one reviewer, is justified by its contents. However "obscure," however unimportant the Thirty Years' War itself may be to the student of the history of England, which alone was not drawn into the bewildering vortex of its plots and counterplots, its passions, motives and policies, the struggle certainly involved all the rest of the civilized world of that period—even Turkey—and it is from the international, not the English, point of view that the *Cambridge Modern History* has been projected. It was a war of and for the Empire, a war of and for religions, a struggle of the Hapsburgs for the realization of their "A. E. I. O. U." motto—*Austriæ Est Imperare Orbi Universo*—but it became much more than all these, a cause and a pretext for the carrying out of many conflicting policies, of which only those of France yielded fruit commensurate with the cost—to others. It was also, Mr. Leathes opines, "a blind, unconscious struggle of the nations to achieve their own realization, to attain self-determined, organic unity." Gustavus Adolphus, Wallenstein, Richelieu, soldiers and statesmen, owed their success to this impulse, he holds, in greater measure than to their own wit and skill.

A notable feature of the volume—it will remain an exceptional feature of this particular volume, the editors inform us—are its bibliographies, especially that of the extant original manuscripts and contemporary narrative and controversial literature of the Thirty Years' War, based on the collections in Lord Acton's library, without which, indeed, it could not have been compiled.

* THE CAMBRIDGE MODERN HISTORY. Vol IV. THE THIRTY YEARS' WAR. New York: The Macmillan Co. $4.00.

Graham of Claverhouse. By Ian Maclaren. New York: Authors' and Newspapers' Association. 50 cents.

The death of the Rev. John Watson, at Mount Pleasant, Ia., on May 6th, makes the duty of reviewing his latest book a painful one. Not that we have to soften any harsh criticism of it, but one must sadden at the thought that we shall never see more of his touching stories of Drumtochty or of his broad-minded and practical theological works. He did not, as some of the papers have said, die away from home. America as well as Scotland claimed Ian Maclaren, and honored as they deserved the gentle humor and deep humanity that sweetened and enriched his religion. *Graham of Claverhouse* is in quite another vein from the "Kail-yard Stories." It is the life of the Viscount of Dundee, "Bonnie Dun-

dee" of song and legend, one of the best-loved and the worst-hated men in all history; fair of face, brave of heart, a remorseless foe, a loyal friend, a "devil" in the eyes of the Covenanters whom he hunted among the hills of Scotland, an "angel" to the Jacobites, whose best officer he was; a brilliant but tragic figure among the many who gave their lives for the ill-fated family who were the curse of Scotland and of England as well; James Stuart had no more loyal follower, nor one more unhappy than John Graham, of Claverhouse. Yet it is strange to read his story, told by a Presbyterian minister whose sympathies would naturally lie upon the side of the Covenanters whom Claverhouse harried across the mosshags! There is no trace of unfairness in this presentment of the cavalier by the Presbyterian, and the portrait is attractive.

"All a man can do, Jock, is to walk in the road that was set before him from a laddie, and to complete the task laid to his hand. What will happen afterwards doesna concern him, so be it he is faithful."

No one could accuse Claverhouse of unfaithfulness to his King or to his duty—as he understood it. That his loyalty was wasted upon the Stuart line, and the orders he obeyed were cruel to the Covenanters, was his misfortune. But the sun that set upon the field of Killiecrankie lighted no more brilliant nor more tragic figure than that of "Bonnie Dundee," fallen in the moment of victory, nor did he find an unfitting historian in Ian Maclaren.

John Calvin, the Organizer of Reformed Protestantism. By Williston Walker. **Balthasar Hubmaier, the Leader of the Anabaptists.** By Henry C. Vedder. New York: G. P. Putnam's Sons. $1.35 each.

Both of these biographies are conscientious and scholarly, and each presents in brief compass the essential facts concerning a great religious leader, together with a fair critical estimate of his virtues and limitations. With a difficult subject, Professor Walker has taken particular pains to be impartial and just, both to his hero's greatness and his failings, and he has succeeded well. Hübmaier was the greatest preacher and scholar, as well as the sanest and noblest man, of the German Anabaptists—a people despised almost to our own day, but in reality the truest Christians of their time. Professor Vedder has done well to tell the story of his heroic life and martyrdom on the basis of original investigation. A list of twenty-six chief writings of Hübmaier is given, and a translation of the more important of these is promised later. Both these biographies contain interesting photographs of the scenes in which their subjects spent their lives.

Christopher Columbus and the New World of His Discovery. A Narrative by Filson Young. With a Note on the Navigation of Columbus's First Voyage, by the Earl of Dunraven, K. P. 2 vols. Philadelphia: J. B. Lippincott Co. $6.50.

The knowledge of motives and mental processes of Columbus which Filson Young displays in his new two-volume life of the navigator is enough to make the world of Columbian scholarship stand aghast. The author writes for the general public, admits that he has not "added one iota of information or one fragment of original research," and pleads guilty to a "purely human interest" in his subject. Yet he incessantly rushes in to analyse the mental condition of the admiral on all possible occasions. His training consists of a fair reading in secondary works. He cites enough titles in his preface for the foundation of a worthy popular biography. But he seems not to realize that all of the Columbian literature is not rated as equally valuable, and that to disprove certain claims is less an evidence of keenness than of lack of understanding. "The historians," he writes, "have been committed to the austere task of finding out and examining every fact and document in connection with their subject. . . . It has been my agreeable and lighter task to test and assay the masses of bedrock fact thus excavated by the historians . . . to discover . . . what Christopher Columbus *was*." We fear he has not succeeded. Mr. Young is unable to take Washington Irving "seriously," finding him "so one-sided, so inaccurate, so untrue to life, and so profoundly dull." But in literary form, at least, we prefer the maligned American. Our author abounds in the historical present;

uses the frequent pious interjection and exclamation; and makes transitions of thought thru tricks of compositors' work. No man, however, can always be wrong, and an overvivid imagination occasionally really portrays. For this, on Isabella, we can forgive many things —"for in that strange duet of government it is her womanly soprano that rings most clearly down the corridors of Time." Professor Channing has said that she had "great capacity as a manager of men—including Ferdinand."

Literary Notes

....Duffield & Co. have just published *Business and Education,* a collection of important essays and addresses written by Frank A. Vanderlip, vice-president of the National City Bank, of this city.

....A book of suggestions to ministers in reference to their work with Young People's Societies is *The Young People's Pastor,* by Amos R. Wells. (United Society of Christian Endeavor. 75 cents.)

....Mrs. Anna Brown Lindsay's *The Warrior Spirit in the Kingdom of God* is issued in new form by the Macmillan Co. ($1.50 net.) The book is a plea for an earnest and aggressive spirit in the Christian Church.

....Questions connected with the future life are accorded popular, homiletical treatment in the Rev. John Balcom Shaw's *Life That Follows Life.* The author is a Presbyterian pastor of Chicago, formerly of New York. (Fleming H. Revell Co. 75 cents.)

....Mr. S. D. Gordon, who has secured a large following for his "Quiet Talks" on religious themes, sends out another devotional volume entitled *Quiet Talks on Personal Problems.* (A. C. Armstrong & Son. 75 cents.)

....Those who follow the work of the Rev. G. Campbell Morgan will be interested in two recent volumes. *The Practice of Prayer* (75 cents) and *The Simple Things of the Christian Life* (50 cents). Both are devotional and practical. (Fleming H. Revell Co.)

....All of the printing and publishing of Charles Scribner's Sons will be done in their new building, now being completed at a cost of $1,000,000. Books will be begun on the ninth floor, printed on the eighth, and so gradually carried down in the process until they are ready to ship from the lowest floor.

....McClurg & Co., Chicago, will soon publish the second set of two volumes of Molmenti's *History of Venice,* a beautiful edition of this standard work. Among their other spring books are *The Iron Way,* the story of the Central Pacific Railroad; *Indian Love Letters,* by Marah Ellis Ryan, and a guide to the city of Paris for tourists, students and shoppers.

....Mr. Julius H. Greenstone writes of *The Messiah Idea in Jewish History* from the Jewish point of view, with endeavor to produce fair and impartial history. His book traces the Messianic idea as it continued in the Middle Ages, paying special attention to the Jewish medieval philosophers. (Philadelphia: The Jewish Publication Society of America.)

Pebbles

DICK DEAD-EYE'S COMPENSATION.

"THE night hath a thousand eyes";
I have but one;
But I have a mouth and nose,
The night hath none.
—*Princeton Tiger.*

THE baby rolls upon the floor,
Kicks up his tiny feet,
And pokes his toes into his mouth,
Thus making both ends meet.

WHERE CUPID WORKS OVERTIME.

WHILE passing thru Neel last Friday we had the pleasure of meeting W. J. Roberts, the fruit tree and razor-back hog agent.

Rube Puckett, East Danville's nicest young man, and Will Evans, of Oak Grove, paid Decatur a bluebird trip last Monday. Of course, Will had business at the court house.

Miss Ethel Puckett, the sweet little belle of East Danville, spent Saturday night and Sunday with Miss Emma Shipp.

Ask Miss Ethel Puckett about the letter she received while at Neel.

Van Dees, the handsome young man of Second street, made a trip to Hartselle Saturday.

A certain young lady of this place says Van Dees is the best looking young man in Danville. Hurrah for you!

Van Dees, of Second street, attended preaching here Sunday night.

They say—

That your scribe is all smiles this week.

That Miss Annice Stover is going to get married.

That the wedding bells will soon ring for Rube Puckett and Miss Mattie Kirby.

That Oscar McCaghren and Miss Ethel Puckett have joined the sweetheart list.

That Miss Gertrude Sparkman, of Oak Ridge, is a pretty girl.

That Bud Payne would like to meet Miss Rosa Vest.

That Miss Lillian Roberts is as pretty as a winter pink.

That Van Dees is a perfect ladies' man.—*Danville Correspondence New Decatur (Ala.) Advertiser.*

Editorials

Presidential Candidates

SECRETARY TAFT will have the support of his own State in the Republican National Convention, and it may be given to him without a contest. The "reactionary" opposition is melting away. Those who were inclined to assist Senator Foraker in making war upon the Secretary surrendered last week. Even Boss Cox now urges the party to support the man who so sharply attacked his methods two years ago, and to whose righteous hostility was due, in part, his loss of power. All this will surprise no one who is familiar with politics in Ohio. We have not believed that the Republicans of that State would permit a factional contest involving both denunciation and defense of the policies to which the party, under the leadership of Mr. Roosevelt, is committed. We remember saying six weeks ago: "Perhaps after a time we shall see harmony restored and the Senator, at the head of the Ohio delegation, nominating Secretary Taft in the National Convention. Stranger things have happened." For the Senator that role will still be reserved, altho now, withdrawing his approval of them on the 8th inst., he protests against the plans of his friends for a restoration of harmony.

Now that the first obstacle in Secretary Taft's path appears to have been removed, he stands before the country as the foremost Republican candidate, at the present time, for the Presidency. We assume, of course, that Mr. Roosevelt is not a candidate. The Secretary does not seek a nomination because he greatly desires the office. It is known that he prefers another place. He has been made a candidate mainly by the efforts of his friends, and especially by the desire and influence of that one of his friends who is now President. It is probably necessary for the success of the Republican party in the election of 1908 that its nominee shall be a man known to be an earnest supporter of the domestic policies so vigorously promoted by Mr. Roosevelt, and especially those which relate to the regulation and control of railway companies and other great corporations. Mr. Taft's attitude toward those policies has not yet been clearly defined.

He has been in public service on the bench, in the Philippines, and at the head of the War Department. The public is satisfied that the tasks in which he has been engaged have, on the whole, been well performed. Some of them have required much tact and ability. They have been in fields apart from those to which the policies in question relate. The evidence as to his attitude toward those policies must, in the public mind, at the present time, be confined to the fact that he has been a loyal member of Mr. Roosevelt's Cabinet, and to the additional fact that Mr. Roosevelt desires that he shall be nominated and elected. The president's opinion, thus expressed, will probably be sufficient for many. We presume that in the near future the Secretary's own opinions will be given to the public.

He is the foremost Republican candidate today, but he is not the only available one. At Washington, it is said, they are talking of a Taft and Hughes ticket. We believe that the Governor of New York is qualified not only for the second place on the national ticket, but also for the first.

It happens that the attitude of Governor Hughes toward the domestic policies of which we have spoken has been defined plainly and continuously since the beginning of his term, in the framing of important projects of legislation, in contests with unworthy and corrupt legislators, and in many admirable public addresses. The Governor's earnest and persistent efforts in behalf of his Public Service Corporations bill closely resemble President Roosevelt's fight with the Senate for the Railroad Rate bill. By this measure the Governor seeks, thru effective regulation and restraint, to remove and to prevent great evils in the conduct of the railway and other public service corporations of a commonwealth containing the greatest of American cities and one-tenth of the nation's people. It was a formidable undertaking. A week ago, his failure seemed inevit-

able. But he had relied upon the people, and his confidence in them was not misplaced. Now it appears that their influence, exerted in response to his appeals, has driven to his support the politicians whose opposition promised, a few days ago, to defeat his entire program of reforms.

This program includes a radical improvement of administration at the capital, the purification of elections, and other changes suggested to the keen mind that brought to light the manifold iniquities of the financial management of the great life insurance companies. That part of it which affects the public service corporations strikes at the same evils against which the President has contended and still contends. At Elmira, on the 3d, Governor Hughes, answering a speaker who opposed official regulation and who asserted that it was causing popular unrest and revolt, said:

"Will any one suggest to an intelligent audience that American citizens are in revolt against their own prosperity? What they revolt against is dishonest finance. What they are in rebellion against is favoritism which gives a chance to one man to move his goods and not to another; which gives one man one set of terms and another set to his rival; which makes one man rich by giving him access to markets, and drives another into bankruptcy or into combination with his more successful competitors. It is a revolt against all the influences which have grown out of an unlicensed freedom and of a failure to recognize that these great privileges, so necessary for public welfare, have been created by the public for the public benefit, and not primarily for private advantage."

A few days later, speaking in New York City, he said:

"It is not necessary that I should talk to citizens of New York on the need of the regulation of public service corporations. You have witnessed in this community the most flagrant disregard of public duty on the part of those who enjoy public privileges. You have witnessed stock jobbery and financial operations which no one has the audacity to defend. You have seen economies enforced at the public expense in order that fixed charges and guarantees improperly created could be met. You have seen the public convenience ignored and the people herded together, not simply when the pressure of traffic during certain hours exceeded all available means of transportation, but at other times when there was no necessity for it except in improper financiering. Now, I propose that we shall have a just and efficient regulation of public service, that the State shall exercise its power to see that the people get their due."

Many other passages from his recent addresses might be cited to show his vigorous and intelligent treatment of such questions. In a smaller field he is dealing with the same problems that the President has sought to solve, meeting the same opposition of powerful private interests and of legislators controlled by them. He is cool, patient and persistent. His conception of the duties and proprieties of a high executive office is ideal. From the beginning he has steadfastly refused to use executive or political influence in the Legislature, to invite the support of the organization leaders of his party by any patronage favors whatever, to encourage the formation of any group of personal advocates, or even to accept offers of Federal patronage designed to assist him in overcoming selfish or corrupt opposition. But he is no visionary or mere theorist. He simply aims to serve the people honestly, effectively and justly. And he is content to serve them within the limits of the field in which by their votes he has been placed.

Secretary Taft and Governor Hughes are by no means the only Republican leaders who would serve the people faithfully and effectively at the White House. We have spoken at so much length of the Governor because it seems to us that his exceptional qualifications, not yet widely known, deserve to be considered by his party thruout the country.

The Stability of Motion

THOSE who have watched the itinerate toy vendor give his demonstrations will remember that one of his most fetching miracles is to pick up a little cubical pasteboard box and stand it on one corner on the point of a pencil. With the corner caught in a loop of thread, the mysterious box stands out horizontally without support, ostentatiously indifferent to the force of gravitation. Then he sets it up on a wire slightly inclined, down which it travels in a dignified way like a rope walker, straightening up proudly whenever the demonstrator flips it with his finger. This behavior of the box seems quite uncanny until he opens it and shows that it contains a spinning gyroscope top; then we understand it, or

think we do, which is equally satisfactory to the perturbed mind.

The principle that a whirling wheel resists all forces tending to tip it out of its plane of revolution has had few practical applications hitherto. The best known is the rifle bullet, which is sent out spinning from the gun in order that it may not be easily deviated from its course. The automatic torpedo is kept in its level by means of a gyroscope flywheel, which may also serve as the motive power.

It was probably his familiarity with this use of the gyroscope that led Louis Brennan, the inventor of the Brennan torpedo, to conceive the idea that the same means could be used to insure stability to a single-rail car. Last Wednesday, according to a report in the New York *Sun*, he gave a very interesting demonstration of its practicality before the Royal Society of London. His model locomotive, one-eighth the contemplated size, ran around the room on one rail, and along a wire cable, maintaining its balance just as well when its track was steep and crooked as when it was level and straight. When tipped it righted automatically, and when the load was piled on one side of the car it tipped just enough to balance it directly over the rail. The balancing mechanism consisted of two flywheels rotated in opposite directions at a very high velocity by an electric motor. Since the wheels were mounted on almost frictionless bearings in a vacuum the power required to keep them running was very small. The weight of the apparatus was only about 5 per cent. of the total weight of the vehicle.

Mr. Brennan believes that the plan is entirely practical on a larger scale, and would be of especial value in wild and mountainous country, and in carrying supplies to the front in time of war. A single rail of the ordinary weight may be laid on short ties on the ground without regard to level or curves, and rivers crossed on a single swaying hawser. The road wheels are placed in a row under the center of the car on pivoted trucks so as to turn short corners and go over uneven ground. Since there is no flange friction or jolting two or three times the speed can be obtained with the same power. The gyroscope wheels will run for several hours with their own momentum, so even if the power were cut off the car would not fall over. The inventor thinks that roomy passenger cars, fifteen feet or more in width, can be safely run at a speed of more than a hundred miles an hour. He also believes that the gyroscope can be applied to flying machines to overcome the instability which is now their great difficulty. The weight of the flywheel would, of course, be a disadvantage, but since its power in resisting tilt increases with the square of the speed, the weight need not be great if it is run very rapidly.

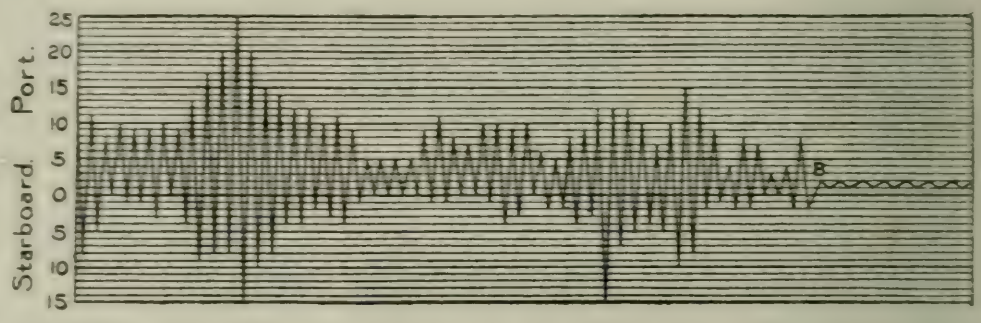

Diagram Showing How the Rolling of a Boat is Stopped by a Gyroscope Applied at the Point B.

Another practical application of the gyroscope recently demonstrated is for steadying ships. An apparatus for this purpose has been constructed by a German engineer, Dr. Otto Schlick, and has been tried by Sir William White on a torpedo boat, the "Seebar." The boat was 116 feet long, 11.7 feet wide, 3.4 feet draft, and of 56 tons displacement The gyroscopic apparatus contained a flywheel a meter in diameter, weighing 1,106 pounds, run by steam as if it were a turbine.

Its effect on stopping the roll of the boat is graphically shown by the accompanying diagram, which we copy from *Nature* of April 11th. On the left is the record of the boat's oscillation under ordinary conditions. At the point marked B the gyroscope wheel was released and,

as will be observed, the rolling was promptly and almost completely stopped. When the boat was tipped in still water to an angle of 10 degrees and then released, there were twenty single oscillations before they were reduced to half a degree when the gyroscope was at rest. With the gyroscope in motion at the rate of 1,600 revolutions a minute, the rolling was reduced to the same extent after two oscillations. The perpendicular heaving of the boat was, of course, not affected. Whether this contrivance can be profitably used on a large ocean vessel remains to be seen. Sir Henry Bessemer's attempt to use it on a Channel steamer thirty years ago was not a success. It is pointed out by Sir Hiram Maxim that a strong wind blowing at right angles to the track would gradually tip over Mr. Brennan's train, and he does not believe that the gyroscope will be of any value for steadying ships or cars.

Public Courage

We have grown accustomed to such phrases as "public opinion," "public sentiment" and "the public conscience." They stand for realities, despite the fact that there is no great being composed of human individuals which has a consciousness above or apart from the personal consciousness of ordinary men and women. To the extent that ordinary men and women have similar feelings at the same given time, or at the same given time have agreeing thoughts, there is social or public sentiment, social or public opinion. In like manner, to the extent that men and women form agreeing purposes and concertedly strive to achieve them, there is a public will.

Many signs encourage us to believe that very soon we shall have occasion to use yet another phrase which, like those named above, will be the name for a great social reality. There are indications that here in the United States we are developing a public courage, and that it will prove to be a decisive factor in maintaining a democratic social order.

The powerful interests that have been assailing the politically organized people of this American republic have not hesitated to resort to intimidation. Their initial threat was the vague and general prediction of disaster to "business" that must inevitably follow any attempt by legislative and executive action to regulate corporate activity in the interest of common rights and fair play. No people, we were told, can afford to discourage enterprise; and disaster overtakes the community that fails to remember how shy and retiring is that good and dainty fairy known as "capital seeking investment." Notwithstanding these threats the people had the temerity to enact much State and Federal legislation restrictive of combinations and prohibitive of certain modes of trust organization.

Encouraged, doubtless, by the happy circumstance that, notwithstanding this bold conduct, business continued to occupy the attention of the captains of industry, and "capital seeking investment" continued to lend its gracious aid to promising undertakings, the public ventured to call the great insurance corporations to account. It dared to expose the rascalities whereby a most beneficent form of financial enterprise had been made to serve less the well-being of millions of common men and women, anxious to provide for their future, than of the promoters, eager to control the uses of vast surplus funds. This proceeding struck almost at the foundations of the financial structure. Not a few experienced wise heads in the business world in all sincerity expected that the edifice would fall in ruins about the moral Samsons who thus intruded beyond its portals. Yet the temple stood, and the buyers and sellers of credit continued their vocation.

By this time public courage had undoubtedly come into being, and, what is more, the public was beginning to be conscious of its courage. Summoning its strength, it now began to deal with the railway situation, and in so doing to awaken a degree of alarm which was unmistakably general and profound. The various States entered upon a drastic course of two-cent fare legislation after the Federal Congress, enacting the rate bill, had given the Interstate Commerce Commission far-reaching powers of regulation. Intimidation this time expressed itself in specific threats. The railways would countermand orders for exten-

sions, improvements and adequate equipment. They would take off their fast trains. They would let roadbed and rolling stock run down. The situation was made to look really dire.

It put the public courage to a serious test, and no one looking at the situation today can doubt that the test has been met. The public has held its ground, grasping interests have been defeated at every point. It has been made perfectly clear to every intelligent mind that the public not only can remain in control, but that it has the courage to do so, and that beyond a doubt it will do do.

Train schedules have not been materially changed. Freight and passengers are "being moved" quite as usual. No great scheme of improvement has been abandoned. Railway managers have no intention whatever of resting content with present facilities and operation. Mr. Harriman is again busy with gigantic schemes for re-financing the Union Pacific properties.

In short, public courage has come into existence in the American nation, and already it has justified itself and given us fresh assurance for the future.

Ethics and Religion

In the combination of these two words we are just now putting Ethics first because the organization of the American Ethical Union, composed of the so-called Ethical societies in the country, gives the present occasion for comment. Ethics also comes before religion historically, altho it includes less and is less effective even for its own purpose.

It is some thirty years ago that Dr. Felix Adler, because of his radical views, was rejected as successor to his father, who was rabbi of the principal liberal Jewish temple in this city. He was too advanced for the advanced Hebrews. He had given up the obligatory character of the Mosaic legislation, with all the supernaturalism on which it was based. So he went out from ecclesiastical Judaism, and took with him a small number of adherents of his own race.

But the young Felix Adler, in giving up his ancestral religion, had not given up its ethical teachings, but had been ready to add to them anything he might gain from Christianity or Buddhism. He held that it was not religion, but the Ethics, in religion or out of it, which is effective to save society, and he felt the obligation on himself to teach the eternal No and Yes of Ethics to those who had parted with their religious faith. When religion goes, with all its imperative, men must make all the more of the basal moral requirements, or they will settle into weakness and vice. Unitarians have learned this lesson. and the Ethical Culture movement, which cannot easily be distinguished from radical Unitarianism, had the same task, to define and broaden individual and social duty, and add the obligations of Christian love to those of Hebrew righteousness.

Dr. Adler's work has been a noble one. He has attached to himself others not of Hebrew birth, and other societies have been organized in leading cities of this country, in Europe and even Japan, led frequently by those who had withdrawn, for theological reasons, from the Christian ministry. A most admirable kindergarten and other schools have been conducted, and the members have taken the greatest interest in questions of social and political morality. Too high praise cannot well be given to their unselfish faithfulness in these duties, or to the consecration of their acknowledged leader.

Now the question comes to us, What is the use of religion if Ethical Culture will do all for the world that religion will? This, first, Ethical Culture lacks: it omits all duties to God. It must do it, because it does not know any God; it is either agnostic or atheistic. But if we believe in God, we have ethical relations to him and he to us. We have the same duties to him that a child has to a father, the duties of love and obedience to his laws. All that warmth of passion and devotion toward the loving Heavenly Father which religion teaches Ethical Culture loses. There remain, to be sure, love and devotion to Humanity, but religion has all that also. Especially does Ethical Culture lose the passionate devotion which Christianity fosters toward God as manifested in the cross of Christ.

Still further, Ethical Culture loses the incitements toward right living which religion presents. We do not say that the altruism of Ethical Culture may not

be developed to all the hights of the love of the Christian religion, so far as duties to Humanity are concerned; but this altruism is taught simply as duty; and there are attached to it none of the enforcements which belong to the future life; for Ethical Culture knows nothing of a life of either joy or sorrow in a future world. For detached and resolute souls, it is possible to feel the compulsive power of right and the repulsive nature of wrong; but to the ordinary man stolen waters may taste sweet, and he needs to be drawn and driven by hope and fear into the right way. All human law knows this, and natural law teaches the same lesson, and divine law adds its tremendous sanctions. So it is that religion has almost seemed the only basis of morals—which it is not, altho Paul in a moment of rhetorical fervor said: "If the dead are not raised, let us eat and drink, for tomorrow we die." He was stoic enough to know better. He did not mean it literally, for it is not true. Yet it is practically true to a vast number of people; and prudence, foresight, is a large part of both virtue and wisdom. History and every man's knowledge show that when religion fails the moral standard also drops, often out of sight; so religion is of the greatest importance to the community, altho there are those, and we rejoice there are such, who would do right, tho the heavens fall and tho Heaven falls also.

So, if there are those who have lost their hold on God, and so have no place for religion, we rejoice that they can practise and teach Ethical Culture. It is almost a Church. It is a full Church, so far as Humanity is concerned. It is the ally and not the enemy of the Church; and we add our tribute to the noble work which Dr. Felix Adler has done. It magnifies, it glorifies conscience, and so is a saving salt to society.

The Little Pedagogs

When we come to judge by the results, which are the greater educators the university doctors from whom a man takes his degree for a certain amount of memory work in books and laboratory experiments, or the little pedagog who begins to discipline him from the day he is born to him till the day of his death? It is the baby who teaches him patience, as distinct from the pedantic persistence of the scholar; it was the baby who thrust new responsibilities upon him, forced him to work overtime and to lead a new life generally for his sake. It was the baby who led him back with toddling steps to strange intimacies with nature, made him see the rose with his joy and enabled him to recognize the butterfly as a companion. No mere biologist could have imparted this inspiring kind of information. But that is the peculiarity of this young pedagog. He takes you in hand with a serene optimism after you have past the acquisition age of youth, and he teaches you more than any college faculty can possibly impart. And his is a course you cannot "flunk" once you have begotten him. After that he has got you. He offers no degrees, no medals; he is expensive, exacting, but you learn the things you must know, and you do the things you must do for his sake, because, bless you, the baby is a pragmatist. You do not get your lesson by rote from him, but by experience. He saves you from the dotage of covetousness, by needing all you have, and makes the whole Decalog not only "workable," but obligatory.

All this explains the existence of babies. They are the great disciplinarians. And we learn more from them first and last than they ever do from us; for, at best, we can only give them second-hand information and wisdom that was only wisdom for us, but they reveal the future to us. They are born with it—hidden in them like a secret, and they hint it to us with their first stammering words, only we are too dull to understand. They pierce our darkness with a thousand questions which we think are idle, but later on they work out answers that amaze and terrify us. For the first ten or twenty years we have the advantage only because we are too dull to learn as much from them as they do from us. But after that they escape and become that insufferable thing known to us as "the younger generation." They are the blessed wild oats we sowed unawares and they survive by outraging our convictions. They contradict us at every turn, show a contempt for our very "ancients." They have no taste and no manners according to our standards, but

they get there in spite of the way we cling to their flying coat tails and hinder them.

The trouble is that while we do not overestimate the importance of the education of our children, we do greatly underestimate the good and the importance of their discipline and influence upon us. And we are neglecting the educational advantages of being the parents of these brand-new creatures, whose very innocence is informing, whose vision of things is often more immediate than that of the philosophers and whose confidences make us kin to the angels in heaven. No man ever went astray under this wonderful tutelage; and one reason why the mother-woman is so often superior to the father-man is because she learns so much more than he does from these little nursery pedagogs. Her babies keep her in the spirit. It is not so much the bearing of them that sanctifies her, but it is her knowledge of them, the love-searching which enables her to interpret their every cry. They are her texts, her prophesies, her revelations from day to day. She forgets the wisdom of this world. She becomes "a poor hand at figures," neglects her own "accomplishments" and becomes a ridiculous conversationalist in society with her quotations from the nursery; *but* she graduates under the tutelage of such as are of the kingdom of heaven, and she shows it. We feel over and above their narrowness and simplicity the infallibility of such women, and they keep to the last those tender cradling hearts which change strong men to little children in their presence. This is the most serviceable kind of education to have. But these women and a few others are about the only people who profit enough by their association with children. And the rest of us would not have gone as far wrong as we have gone if we had been more mindful of the things that only children teach.

The British Ministry

The Liberal British Government is in no present danger of overthrow. It is passing thru a period of criticism and reverses, but not of peril. To be sure, the by-elections have shown losses of seats and popular favor, but that is natural and usual after so tremendous a success. The Government has past its first measure, the Education bill, to have it rejected in the House of Lords; but that has not weakened its strength. Now come other questions of policy, each one of which will estrange some friends, so that there will be the appearance of popular loss; and yet the majority is too strong to be overcome, and we believe the people are still with the Government.

The Irish bill is just now the object of attack. Of course, the Tories are all against it; but that does not count. It comes far short of Gladstone's brave attempt to give Ireland a Parliament of her own; for this is devolution and not home rule. It is not all that Ireland has justly asked for, but it is all that is now possible; and while the Irish leaders say they are dissatisfied they are sure to accept it as a long step toward what they demand, and they will take it gratefully. The bill gives, out of the public funds, a handsome amount to the new Irish Council, which will have the executive administration of eight departments of government, including education. So we believe that this Irish bill will be seen to be a great boon to Ireland, and that it will not really weaken the strength of the Liberal Government.

The meeting of the Colonial Premiers has been an occasion for no little public criticism of the Liberal policy. Already the courage and the generosity of the Government toward the Transvaal had excited the fears of the Opposition. Why trust, they said, those with whom we were so lately at war, and who have elected General Botha as their Premier? But with the Premiers came to London General Botha, and he has been the popular idol of their meeting, tho he talked only Dutch. Mr. Chamberlain's policy had encouraged the Colonies to hope that Great Britain would reverse its free trade policy and give preferential tariffs to them. But altho they asked this, and then asked for preferential rates on the few articles, sugar and tobacco, on which Great Britain puts a tariff, it was impossible to yield this demand, and it was not expected. Some enemies are made, but Great Britain and the Premiers also will allow that in this case the Cabinet did only what it must.

Now, a new evidence appears of the

foreign policy of the British Government, and one which will strengthen rather than weaken it. A treaty has been made with Japan, whereby Great Britain and Japan agree each to respect the present interests of the other in Asia. Then follows, under the good will between Great Britain and France, a similar pact between France and Japan, under which each of these two Powers agrees to respect the present Asiatic rights and claims of the other. It would not be strange if similar treaties were made between Japan, on the one side, and Russia and the United States on the other. This seems to be the wise policy initiated and aided by the Liberal Government of Great Britain. Much has been said, in past years, of the weak foreign policy of the Liberal party, but this is an evidence of the broadest statesmanship. It assures peace in the Orient. It protects Japan's interests in Formosa and Korea, while it eliminates the so-called Yellow Peril, so far as Japan is concerned. The Yellow Peril becomes the Yellow Safeguard to American possessions in the Philippines and Guam, to the British possessions in India and Burmah, and to the French possessions in Tonkin and Siam. Further, it assures peace; and it may be quite as effective to that end as is the coming Hague Conference.

We see, then, only a flurry of opposition in England to the Government. We believe it will hold its power, and that it will prove one of the greatest and wisest administrations that Great Britain has ever possessed.

Sanitation of Small Towns

We hear much of the reduction in the death rate of large cities in recent years, but very little about the improvement of the health of small towns. It is well known that all the infectious diseases claim many less victims in city life than they did twenty-five years ago, and the reason for it is not far to seek. Cities established departments of health, gave to them ample powers, and then insisted on their being effective if their appropriations were to be continued. The consequence has been that not only has much suffering been spared, but thousands—nay, even hundreds of thousands—of people are now alive who, in the words of one prominent sanitarian, have no business being alive—they would have been dead if the death rate that prevailed twenty years ago still obtained. Had they died their death would have been considered as from the hand of God. We know that their living is the result of the taking of some very simple measures for the prevention of disease.

What is needed at the present time is that the benefits of such sanitary progress shall be conferred upon the smaller towns and even the villages as well as the large cities. All the infectious diseases are proportionately more common in the country, especially in small, close-living communities, than they are in the city at the present time. Diphtheria works more ravages in towns of ten thousand inhabitants and less, in this country, in comparison to the population, than it does in our cities of over one hundred thousand. Typhoid fever is frankly conceded to be a rural rather than an urban disease. Unfortunately, its occurrence in the country places leads to the contamination of city milk supplies, with the consequent serious distribution of the disease among city dwellers. Typhoid fever as a suburban disease affects the water supply and this proves another source of city typhoid.

There is need then, not only for the organization of boards of health in the smaller towns, but for intelligent care on the part of the citizens that they shall accomplish their task of protecting town health. We have before us an excellent example of how much has been accomplished by the board of health of one small town by the application of what may be called city methods in the enforcement of sanitary measures. This town is Montclair, N. J. It has a population of only 17,000, yet it employs and has employed for more than ten years a sanitary engineer as Health Officer, who devotes all his time to the work of caring for the town's health, and who has, besides, two assistants who also give all their time to this department. The result has been eminently satisfactory. The Health Officer was originally appointed as the result of a milk epidemic of typhoid fever, during which some eighty cases of the disease occurred. This

brought home very emphatically the necessity of protecting the milk supply, and that desideratum has been secured with so much success that no further such untoward incidents have occurred. The work of the department of health in this regard has received the support not only of the general public, but also of the milk dealers, and now the milk supply is so thoroly under control that it would be practically impossible for another epidemic of typhoid fever to be traced to this cause.

School inspection has been taken up very seriously, with the result that always comes from this, a lessening of the epidemics of so-called children's diseases. It is rather ludicrous to realize now that the reason why these affections were called children's diseases was that the young were expected so inevitably to acquire them that they were denominated "the usual diseases of childhood." In old case histories one finds the expression, "the patient had the usual diseases of childhood," without further determination, because there seemed to be so little use in differentiating. Now, it is well understood that not only is there no necessity for children having these diseases, much less any advisability of any exposure to them, but that their after life is likely to be much more healthful if they have escaped them. The only possibility of escape, however, lies in thoro control from a medical standpoint of the schools, since it is from association here that children acquire them, to a great extent. It is the very early stages of the disease; long before it is recognized by ordinary persons, and when only the trained intelligent medical inspector can detect, or often only suspect, that infection takes place. Montclair has suffered from many less cases of children's disease since medical inspection came into vogue.

As might well be expected in New Jersey this department of health has the mosquito problem on its hands. It has succeeded in solving it so far as the larger bodies of water are concerned by the abundant use of mineral oil. The present report points out, however, that there are many small receptacles containing water kept near houses which prove to be fertile breeding grounds for the ordinary form of mosquito. Even an old tin can containing at most half a pint of water provides sufficient opportunity for the breeding of thousands of mosquitoes. Catch basins of any kind that hold water for some days are sure to add to the mosquito nuisance. While there was practically no breeding in any of the ponds, the town cannot expect to be free from this pest until precautions are taken with regard to such private nuisances. Only a department of health would be able to call attention effectively to this state of affairs. Ordinarily it would be presumed that since all the large bodies of water had been thoroly oiled and the mosquito plague still existed, therefore the water theory of mosquito birth was a mistake. Here is the evidence to the contrary, however, placed before the citizens with a practical solution of the problem.

There is only one disease with which the Montclair board of health finds itself in the position of not being able to report progress; that is tuberculosis. In spite of every effort the death rate from this disease during the last five years had increased rather than diminished. This is not an actual increase, but is probably only due to the better collection of statistics. It is recognized, however, that there is no diminution in the death rate of tuberculosis as from other infectious diseases. The reason is that the affection is not reported properly, and that when families in which there are tuberculous patients move from one house to another, no notice is given such as would enable the board of health properly to disinfect and so safeguard incoming tenants from the disease.

In a word, sanitary problems are discussed in this twelfth report of the board of health of Montclair quite as they are in large cities, and the expenditure necessitated by the service has been amply returned to the taxpayer. If every town in the neighborhood of New York that expected to have summer visitors could only make a showing like this, it would be easy to pick out summer quarters with a reasonable amount of confidence, that some infectious disease would not be contracted during the summer that might have been

avoided in city life. We commend the report to the serious consideration of the officials of the smaller towns and country places who have the health of their people at heart. It is a model that well deserves to be imitated.

President Tucker

The unwelcome announcement is made that on account of his health President Tucker positively resigns his office as head of Dartmouth College. That college, in living memory, has had very strong men as presidents, such as Nathan Lord, Asa D. Smith, and Samuel C. Bartlett, all men of force and able administrators and teachers; but to no one of them have students and alumni been more attached than to William J. Tucker. He came to Dartmouth from Andover Seminary, at a time when, in a theological flurry, Andover had lost its hold on its public, and on its students and professors as well. Professor Tucker was one of its most beloved teachers, and his loss, followed by that of Professor Harris, who went to Amherst as president, and of Professor Moore, who went later to Harvard, very nearly caused the collapse of the old institution. But what was loss to Andover was immense gain to Dartmouth. The students have more than doubled in numbers during these fourteen years, and their enthusiasm for their president has been beyond all bounds, while new courses of instruction and new sources of money have given the college fresh strength. It will be very difficult to fill President Tucker's place, and no more successful and no better loved successor can be found. But men pass, but institutions move on, and Dartmouth's best days may still be before it.

Bishop Horstman's Warning

It was a startling address which the Catholic Bishop Horstman, of Cleveland, made last week to the Builders' Exchange, an association of employers, on "Labor." We quote characteristic passages:

"Society is becoming divided into two hostile classes, the rich and the poor. We in Cleveland can look back to a time when the city was under martial law and men were flying at each other's throats. . . . Forty years ago Mr. Rockefeller was happy to get $5 a week as a clerk in a Euclid avenue store. Now his income is estimated at $40,000,000 a year. I believe in a reward for initiative, for industrial courage and genius, in a right profit. But when the employer takes four-fifths of the profits while the men who create the wealth work for life in a hovel and raise a family of six or eight or ten or twelve children, as they do, God bless them; when they do this on from $6 to $9 a week, I say it is a wrong that cries to heaven for vengeance. . . . We may see the day when the tension will snap and the workingmen, long beaten down from what they consider their rights, may rise in their might, as we have seen men do when they forgot their religion in the French Revolution and the French Commune.

"Talk of the militia and martial law! How the workingmen of Cleveland could barricade Euclid and Superior avenues and laugh at the boy militiamen who attempted to quell them! Do not misunderstand me when I say that there is but one man in Cleveland who could restore order at such a time, and that is myself.

"I would put on my episcopal robes and walk from the Cathedral, bearing the cross of the Lord before me and demanding peace. In the fury and bitterness of the conflict I would be shot dead. But there would be Catholics behind those barricades, and when they saw their bishop fall, there would be a reaction, and religion would take the place of madness. Over my dead body would peace be restored."

Possibly the good bishop underestimates the popular force that would be behind the "boy militia," and also, perhaps, the reaction after his martyrdom. It did not come so soon in the French Revolution. And we have a notion that there are other men in Cleveland whose appearance before the mob would be equally effective. What we least like in his address is his suggestion that the working men of Cleveland might be justified in raising barricades, and might do it safely. It approaches incitement to violence.

The Doctors

The physicians are a perennial topic of interest and discussion. Men that ought to know, physicians themselves, have lately declared that the large majority of doctors that come out of the medical schools with handsome diplomas are very inadequately trained, and are incompetent to conduct an autopsy. Doubtless; and doubtless the majority of those that come out of other professional schools, lawyers and ministers, are only second or third rate men. That is because the majority have not the brains to be at the top of their profession, or

lack that gadfly of ambition which makes experts. But this is to be remembered, that while the average is much inferior to the best, yet the poorest of them, the dunces and laggards of the profession, have yet picked up vastly more knowledge than the Galens of old time, and the Paracelsuses that followed. They cannot but have learned much, and will pick up more. And now Dr. Osler tells us that medical students need less lectures and more practical training, and patients fewer drugs and more hygiene and patience, and doctors more courage in telling the sick when they can do them no good.

Secret French History

There is something more than appears on the surface in the announcement in the European press that the French Government will publish the documentary history of the war of 1870 with Germany and has appointed a commission for that purpose. It is not usual with European governments to publish such secret official documents until after fifty years, altho we began to publish our Official Records of the Rebellion full twenty years ago. This publication appears to be a move in the war in France between the Republicans and the Clericals, for it is freely asserted that the documents will furnish proof that France was sacrificed, thru Eugenie, to the temporal power of the Pope. The French people have found many occasions to complain of the Vatican during the steps before and since disestablishment; but if it should be proved that it is Clericalism that is responsible for the loss of Alsace and Lorraine, they will be inclined to forgive Gambetta for his famous saying, *"Le Clericalisme, voila l'ennemi."*

Fifty Years Ago

Time changes the relative value of news. An inconspicuous item which we find published in THE INDEPENDENT, May 14th, 1857, is really far more important than events and questions to which columns were devoted, for it marks the beginning of the great Indian mutiny. The last sentence shows how little the British appreciated the depth of native resentment:

> Some time ago the native troops at Barrackpore exhibited considerable excitement in consequence of an idea which prevailed among them, that their cartridges were greased with beef suet instead of mutton fat, it being pollution for a Hindoo to touch the former. After a time they were convinced they had been deceived in the matter, and quietly returned to their former habits of obedience and discipline.

We do not think that the escaped prisoner, Charles W. Anderson, of Kansas City, has any great reason to be dissatisfied at the decision of Secretary Bonaparte and the President that he must serve three months, from his arrest, in prison before getting his pardon. He was a youth when he was brought by bad company into the offense for which he was sent to prison, and since his escape years ago he had changed his name, lived an honest life, and married and created a home for his wife and child. It is true that he has made a man of himself, and that a chief purpose of punishment has been reached; but now, if he takes his medicine of two months more in prison, he will then have peace of mind and no longer be haunted by the fear of detection.

Mr. Stead cannot make the American public believe that there is anything more than wind behind the words of "a very prominent American statesman," unnamed, that if he had been Secretary of State at the time when Canada sent soldiers to the South African war, an ultimatum would have been given to Canada, as it would have been regarded as a flagrant violation of the Monroe Doctrine. There was no danger, as no intelligent statesman thought of war on that account.

In *The Voice*, the ablest magazine representing the negro, which was moved from Atlanta to Chicago after the riot, Professor William Pickens, of Talladega College, declares that Alexander Dumas, Poushkin, Robert Browning, Alexander Hamilton and Henry Timrod all had negro blood in their veins; and he asserts that the genealogy of Hamilton will for the first time be published this year.

Insurance

Insurance Legislation in Texas

LEGISLATION in Texas which sought to compel the various insurance companies doing business in the Lone Star State to invest 75 per cent. of their respective reserves on Texas business in Texas securities is not working out according to schedule. Twenty-five different companies have already given notice of withdrawal from Texas on June 1 because of this legislation, and the end is not yet. The companies propose to make collections from offices in other States. This move on the part of the insurance companies will be met with an amendment to the gross receipts tax bill, which, in case of its passage, will reach the Texas premiums for taxation at least.

The amendment provides that the companies shall make annual reports to the State of all moneys collected from policyholders in Texas, wherever the collecting agency may be located, and a percentage tax will be levied on the gross receipts from Texas.

In 1905 the forty-three life insurance companies doing business in Texas wrote insurance to the amount of $63,668,642, and at the close of that year they had $256,144,573 of insurance in force. Their premium collections then amounted to $8,212,455. It is estimated that the accumulated reserves now amount to $40,000,000 in round numbers. Texas has a lesson to learn in connection with insurance.

Haste as an Accident Hazard

A RECENTLY published street railway report contains an interesting summary of the manner in which those of its patrons who suffer because of accidents receive their several hurts. During the year covered by the report in question about 400 people were variously injured. Of this number 138 were hurt while stepping off a moving car; 78 persons received injuries because they tried to board a moving car. The company's injunction of "Wait until the car stops!" was thus openly and disastrously defied by a total of 216 persons, or over half of all those who suffered because of accidents during the twelve months. Contributory negligence got in some exceedingly fine work, even if it be assumed that the proportion of women included in this total who got off the car backward is a negligible quantity. Undue haste, the besetting sin of all Americans, and the feverish inability to give due regard to proper repose and to "wait until the car stops," is a precaution doubly needful since the advent of the trolley, with its higher speed and the difficulty of estimating the momentum of a moving car. Haste is fast becoming an accident hazard with which it is needful to reckon. It leads a mob of both sexes to storm the local trams, L trains, subways and bridge cars morning and evening. It inspires a trainload of people to rise from their seats and stand in the aisles for several minutes before the depot is reached, and to this haste is frequently due the spoiling of the last act of a good play, because hats and wraps are donned and the hasty ones are moving toward the exits some time before the final fall of the curtain. We might all do well to recall the old story of the man who died in some haste and was very sorry afterward. It is easy also to get hurt quickly and to recover therefrom only too slowly. It is a good idea to make haste slowly.

THE new president of the Security Life Insurance Company of America, whose home office is in Chicago, is W. O. Johnson, well known as the counsel to the Erie Railroad. The capital of the Security Life is $500,000, its surplus to policy-holders $1,185,000, and its assets $1,500,000.

AN interesting point recently arose in Nashville, Tenn., regarding the way a brick wall should be divided when it is mutual property. Mrs. Louisa Nelson owned a building which she insured against fire. The adjoining building burned and Mrs. Nelson claimed insurance on her partnership wall. It was contended by the insuring company that the damage to the wall, which was 12 inches thick, did not extend beyond 6 inches, and that Mrs. Nelson's interest, therefore, remained intact. Mrs. Nelson's attorneys claimed on her behalf that her interest in the wall was one-half and that her insurance should in consequence cover one-half the damage. The point is a nice one.

Financial

Wheat and Securities

DISAGREEABLE surprise was caused by the Government's crop report issued on the 10th, altho it had been known in a general way for some time that the wheat sown last fall was not coming out of the cold season in good condition. Last year's crop of winter wheat was 492,888,000 bushels; this year, on April 1st, before the damage done had been measured, there were indications of a crop fully as large as that; but on May 1st the Government (reporting results on the 10th) could see promise of not more than 405,000,000 bushels. The reduction is due mainly to the hard weather, altho in some parts of the country the green bug (whose ravages have been of little account since 1890) has recently caused considerable loss. Winter wheat area has been cut down since the April report by 3,533,000 acres. That is to say, so many acres, planted last fall, have been winter killed or otherwise ruined, and have been abandoned so far as wheat is concerned. There was a greater loss of acreage in 1902 (4,868,000) and in 1904 (4,432,000), but the average for the last two years was only 1,550,000. With this loss of 11.2 per cent. in acreage (equivalent to about 88,000,000 bushels), there has been a decline of condition to 82.9, which may be compared with 91 a year ago, and an average of 85.5 for the last ten years. The abandoned area is 70 per cent. in Texas and 35 per cent. in Oklahoma.

Spring wheat will also be affected to some extent by the unseasonable weather, which has delayed seeding in the Northwest and in Canada. Owing to the reports, the price of wheat for July delivery advanced at Chicago to 91⅜ on Saturday, making an increase of 17 cents within a short time. The market for securities was affected unfavorably by the Government's figures, but a greater depressing influence had been exerted on the 9th by the announcement of forthcoming new issues by the Harriman railroads. These are $75,000,000 of convertible bonds by the Union Pacific and $36,000,000 of preferred stock by the Southern Pacific, with an expected addition of $100,000,000 Union Pacific common at a later date. Owing to the recent increase of dividend rates and the expenditure of $131,000,000 for the purchase of stocks of other roads, the announcement made an unfavorable impression.

New England Roads

MUCH has recently been printed about an approaching absorption of the Boston & Maine road by the New York, New Haven & Hartford. By acquiring the Boston & Maine, the New Haven company would obtain control of substantially all the railroad mileage of New England, except the Boston & Albany, which is leased to the New York Central. It was reported that the Central might take the Ontario & Western from the New Haven company, and give in exchange concessions affecting the Boston & Albany. On Saturday last, however, after the regular meeting of the New Haven directors, President Mellen said: "No consideration was had of any arrangement with the Boston & Maine, either by purchase, lease or otherwise, nor is there any proposition of such a character to be considered."

....The pig iron output in April was 2,216,558 tons, a quantity exceeded only in March of this year and in December last. At the beginning of the present month the capacity of furnaces in blast was larger than ever before.

....The Central Trust Company of Illinois, of which Charles G. Dawes, ex-Comptroller of the Currency, is president, and whose capital stock is $2,000,000, with surplus and undivided profits amounting to $966,161, now has total resources of $15,476,000.

....After a thoro examination the New York Clearing House has admitted to membership the Fourteenth Street Bank, of which R. Ross Appleton is president. During the past five years the Fourteenth Street Bank has shown a remarkable growth. In 1901 its capital was $100,000; in 1905 it was $500,000, and it is now $1,000,000. The deposits are now $8,225,000, and the surplus exceeds $400,000.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

National Politics

Following the suggestion made by Chairman Brown, George B. Cox, and other prominent Republicans of Ohio that a conference be held, in order that all factions might unite in supporting the candidacy of Secretary Taft for the Presidency, and of Senator Foraker for re-election, such a conference was called by Senator Dick, chairman of the executive committee. Then, on the 12th, as we said last week, Senator Foraker withdrew his approval of this plan and declared that he would not regard the action of such a meeting as binding upon himself or his friends. His action appeared to have been caused by the published statement of Congressman Burton that the Secretary had "conscientiously refused" to enter into any agreement by the terms of which he should have support for the Presidency in consideration for an indorsement of Senator Foraker for re-election. Some say that the cause was the Senator's discovery that his re-election would not be recommended by the proposed conference. On the 13th, Senator Dick withdrew his call for a conference. No bargain concerning the Senatorship had been made, he said, but there has been a desire to secure harmony in the party. It was evident, however, that harmony could not thus be obtained, and therefore the conference had been indefinitely postponed. On the 17th, Governor Harris and several other prominent officers of the State government published a statement expressing their opinion that all the Republicans of Ohio ought to stand together for the nomination of Secretary Taft, and that the Senatorship should be considered afterward. On the same day a long interview with Chairman Brown was published. Substantially all of the Republican leaders in the State, he said, were for Taft. Such was the attitude of the politicians in three-fourths of the counties, according to their personal reports to him, and he had information that those in the remaining counties agreed with them:

"There are, of course, a number of men in various parts of the State indebted to Senators Foraker and Dick for benefits received. Some of these are, as is natural, a little noisy in behalf of the Senators, but even among them there is not, in my opinion, any feeling for any presidential candidate except Taft. What is much more important, however, is the fact that the people of Ohio are overwhelmingly in favor of Taft. There is not the slightest doubt of this, and anybody who does not know it is ignorant of real political conditions in Ohio. There is absolutely no human chance of stopping the Taft movement in Ohio. It is not possible for any man or any number of men to do it."

But no one who assumed any responsibility for the Taft movement, he added, had expressed a desire to eliminate Senator Foraker from politics. This interview drew from the Senator, on the 18th, a sharp rejoinder. The State officers, he said, had a right to declare their preferences, but the decision of a regular convention was still needed. If the Republicans were overwhelmingly for Taft, the latter's friends should not fear a vote at the primaries. To a part of Chairman Brown's statement, he continued, it was difficult to make a polite answer:

"For rank, dictatorial and offensive bossism, it far exceeds anything I can recall. It amounts to a threat that unless I straightway declare for Mr. Taft I shall lose the Senator-

ship. That may be, but, if so, the fact has no terrors for me. I said at Canton that I would not be dictated to by any kind of a boss, big or little, inside or outside of the State. I meant that announcement for just such bosses as Mr. Brown, and for just such performances as he is now giving us. To be specific, I emphatically resent his dictation, and give him notice that my choice for the Presidency will be named at the next Ohio Republican convention that is lawfully held to nominate State officers, and that, so far as I am personally concerned, I shall abide by the action of that convention as to whether I shall be a candidate again, for any office, and, if so, what that office shall be."

Some who think that the Senator is in sympathy with the reactionaries express the opinion that, in the face of a large majority for Taft, he continues to fight in order that an apparent division in the Secretary's own State may restrain the Republicans of other States from giving him their support.——It is announced upon what seems to be good authority that the Republicans of Pennsylvania at their approaching convention will support Senator Knox for the Presidency as a representative of Mr. Roosevelt's policies, which they will commend; also that in the Illinois convention there will be united support for Speaker Cannon. ——Senator Allison remarks that the greatest issue at the coming session of Congress will probably relate to the capitalization of railroads, and that the tariff question will be prominent in next year's campaign.——Senator Tillman says it looks as if the Democrats would have to nominate Mr. Bryan. In his judgment, the second place on the ticket should be given to a Southern man, Culberson, Hoke Smith or Daniel. In a long article, Henry Watterson considers the candidacy of Mr. Bryan, pointing out that his most recent policies provoke opposition in the South. To promote the candidacy of Mr. Hearst, he says, would be sheer insanity. Mr. Hearst, he adds, has sought the Presidency "with nothing more than a check book and a brass band." If Mr. Bryan, he continues, is not averse to playing the rôle of Warwick, he can tell him of a Democrat who has all the qualities to be desired and who "could still the discords." He does not name the man, but some think he has in mind Governor Johnson, of Minnesota.——Owing to certain reports recently published, Thomas F. Ryan, the railway and Trust capitalist, denies that he promised to Mr. Bryan, last year, a large contribution to the campaign fund if Mr. Bryan would assist him in getting elected to the Senate from Virginia.

New Report on the Oil Trust

Another report concerning the Standard Oil Company was published by the Government on the 20th. It is very long and was prepared by Herbert Knox Smith, Commissioner of Corporations. Parts of it were withheld by order of the President because the publication of them might interfere with the prosecution of the Trust in the suits now pending. The Garfield report was devoted mainly to the Trust's dealings with railroads; the subject of a considerable part of this report is the pipe lines. There is also a history of the consolidation of companies and of the Trust's war upon independent refiners. In 1904, the Trust "refined over 84 per cent. of the crude oil run thru refineries; produced more than 86 per cent. of the country's total output of illuminating oil; maintained a similar proportion of the export trade in illuminating oil, and transported thru pipe lines nearly nine-tenths of the crude oil of the old fields and 98 per cent. of the crude oil of the mid-continent field." The monopoly does not rest upon ownership of the sources of oil supply, for the Trust owns wells yielding only one-sixth of the output, but it was built up, first, by flagrant discrimination in railroad rates; second, by acquiring control of pipe lines and withholding from independent interests the transportation facilities to which they were both morally and legally entitled; and, third, by other unfair practices to be discussed in parts of the report which are to be published hereafter. The Trust's "abuse of its pipe line monopoly" is one of the greatest sources of its power. Commissioner Smith's conclusions are, in part, as follows:

"In brief, the history and present operation of these Standard interests show thruout the past thirty-five years a substantial monopolization of the petroleum industry of the country, a deliberate destruction of competition, and a consequent control of that industry by less than a dozen men, who have reaped enormous profits therefrom. The commercial efficiency

of the Standard, while very great, has been consistently directed, not at reducing prices to the public, and thus maintaining its predominant position thru superior service, but rather at crippling existing rivals and preventing the rise of new ones by vexatious and oppressive attacks upon them, and by securing for itself most unfair and wide-reaching discriminations in transportation facilities and rates, both by railroad and pipe line, while refusing such facilities, so far as possible, to competitors."

In his letter transmitting the report to President Roosevelt the Commissioner directs attention to the failure of the Trust to comply with the common carrier requirements of the new Railroad Rate law:

"While most of the Standard's trunk lines do an interstate business, and should therefore, under the law, file tariffs of rates, four of these interstate lines—the Prairie Oil and Gas Company, which furnishes the only outlet from the mid-continent field; the Ohio Oil Company, which furnishes the only outlet from the Illinois field; the New York Transit Company and the Tide Water Pipe Company—have not filed any such tariffs at all, refusing entirely to accept or deliver oil owned by others. Other Standard lines, while filing certain rates, have done so in such a manner as to reduce their apparent compliance to an absurdity—by filing rates only to insignificant points, where no one desires to ship oil, or to points where the Standard Oil Company only has refineries (for example, naming no rates to New York harbor), by placing impossible restrictions upon the acceptance of shipments (requiring single shipments to be at least 75,000 or even 300,000 barrels in amount), and by fixing even the rates so filled at a point wholly excessive and unreasonable in amount, when compared with the cost of the service. The Standard, having prevented the rise of independent pipe lines, having destroyed or absorbed the few that were successfully constructed against its opposition, having then refused the use of its own lines to producers and refiners who had no other outlet, now plainly intends to nullify, so far as its own lines are concerned, the common carrier requirements of the rate law."

Ruef Admits His Guilt

Abraham Ruef, intimate associate of Mayor Schmitz and known in recent years as the boss of San Francisco, unexpectedly pleaded guilty in court on the 15th, at the beginning of his trial for extortion. Ach, Shortridge and Murphy, his counsel, at once withdrew from the case. His purpose had been made known to them only half an hour earlier. Ruef was pale and weak. After reading his statement he wept and was in a pitiable condition. His health, he said at the beginning, would not bear the strain of a trial, and those nearest and dearest to him had been so affected that their lives were in danger:

"I have occupied a prominent position in this city of my birth, in which I have lived all my life and where, when the time comes, I hope to pass into the eternal sleep. Heretofore I have borne an honored name; on my private and professional life there has been no stain; in my public affiliations until the election of the present board of supervisors, the abhorrent charges of the press to the contrary notwithstanding, no act of mine gave just ground for adverse criticism or deserved censure. But the assault of press and people fails to credit honesty of purpose; and desire to hold together a political organization corrupted the high ideals for which I had been striving. To offer excuses now would be folly. To make an effort at reparation for the public good is more than possible. To assist in making more difficult, if not impossible, the system which dominates our public men and corrupts our politics will be a welcome task. Whatever energy or ability I possess shall be devoted to restoring the ideals that have been lowered. As soon as opportunity is afforded, I shall reenlist on the side of good citizenship and integrity. May it be allotted to me at some time hereafter to have some small part in the esteem of those who move on a plane of high civic morality. In the meantime I begin by an earnest purpose to make the greatest sacrifice which can befall a human being of my disposition, to acknowledge whatever there may have been of wrong, and so far as may be within my power to make it right."

He denied that he was guilty of the charge in the pending case. Later in the day, in a statement for the press, he explained that he had pleaded guilty to save the lives of his father, mother and sister. He had been guilty, he said, of conniving at the corruption of municipal officers by corporations:

"I have made no confession. I know much. Some things I shall tell, some things I shall not tell. Whenever an innocent man has been forced into corruption against his will, that man I shall protect. Whenever a man, be he high or low, has entered into corruption with his eyes open, that man I shall expose. I will not say at the present moment that Mayor Schmitz is guilty of the charges that have been brought against him, or that he is innocent. I will say this: I wanted to break away from Schmitz before his re-election a year ago last November, and said to him: 'I am sick of the whole thing and I want to get out. I can't stand for all these labor union "bums" you have gathered around you and will appoint. They would eat the paint off a house.' In answer the Mayor begged me to stay with him and put up the argument that these fellows must be allowed their share or we could never hold the machine together. There was all too

much truth in that. And I stayed with Schmitz and with the machine."

He found that to hold the machine together he must connive at corruption. In a long explanation of the street railway case he virtually admitted that he had taken a fee for conducting the bribery negotiations. He testified before the grand jury on the 16th, and it is reported that the indictment of several prominent men was ordered. Mayor Schmitz has transferred the powers of his office to a committee of seven men chosen by himself and taken from five commercial organizations. He has promised, in writing, to obey them.

Visitors from Japan

Two cruisers of the Japanese navy, the "Tsukuba" and the "Chitose," came up from Jamestown to New York, on the 15th, and anchored in the Hudson River, where they were joined by five American battleships. On the same day, General Baron Kuroki, hero of the Yalu, came to New York with his staff from Jamestown, where they had represented the Japanese Government at the Exposition. All these visitors from Japan, 1,200 sailors included, were entertained in the city. On the 16th General Kuroki went up to West Point on a visit of inspection. On the following evening he was the guest of honor at a grand banquet given by a joint committee of Japanese residents and Americans. President Finley, of the College of the City of New York, was toastmaster, and Admiral Dewey and Secretary Straus were among the speakers. General Kuroki, when presented by General Grant, expressed briefly his appreciation of his cordial reception. He does not speak English. Secretary Straus read the following message from the General to the American people:

"The Japanese people love peace. They fought for peace. My nation wants peace in which to develop the opportunities that are hers. We have no other desire. The profession which I have the misfortune to follow is noble only because sometimes it is necessary to establish conditions in which peace may be maintained and in which the arts of peace may flourish."

The General entertained many prominent guests at lunch on the 19th, when it was announced that the Japan Society of New York had been formed. Promotion of friendly relations between Japan and the United States is the object of this organization. Viscount Aoki, the Japanese Ambassador, is honorary president, and the president is President Finley, of the College of the City of New York. After lunch, General Kuroki visited the tomb of General Grant and placed a great floral wreath on the American soldier's bier. Japan's two cruisers had sailed that morning for England.

Coming Federation in Central America

Unofficial but apparently inspired dispatches from Mexico point to an approaching federation of the Central American republics, which is to be brought about by means of a revolution in Guatemala for the overthrow of President Cabrera. Guatemala withdrew, on the 14th, her refusal to consider Mexico's demand for the extradition of General Lima. She consented to have Lima tried in his own country for procuring the assassination of ex-President Barillas, and to send to Mexico Colonel Bone, said to be an accomplice. The substance of Mexico's comment upon this was that the action had been taken too late. It is said that Guatemala will be invaded by four columns of revolutionists from Mexico, and that at the same time an attack from the south will be made by an army having the support of President Zelaya, of Nicaragua, whose forces now have possession of Honduras. One of the columns from Mexico (said to have started on the 12th) is commanded by an American, and all are well equipped with artillery. Among these invaders are many Guatemalans who recently fled from their country to escape persecution by President Cabrera, who, it is alleged, is a tyrant guilty of atrocious cruelty in the treatment of persons not in political agreement with him. General Toledo (a supporter of the late Barillas) is the leader of the revolutionary movement. Cabrera, it is predicted, will be driven out of power within ninety days, and Toledo will take his place, but only to facilitate confederation, which will be accomplished by the co-operation of Salvador and of the Provisional Government of Honduras, under pressure from Zelaya. It has been predicted that Zelaya would be the first President of

the federated republics, but it is now reported that he will propose the selection of Policarpo Bonilla, a predecessor in office some years ago of Manuel Bonilla, whom Zelaya recently drove from the presidency of Honduras. Those who make the federation will give to the United States and Mexico a pledge that a general election shall be held within a short time. Costa Rica and Panama will be invited to come in. The population of the proposed confederation (Panama excluded) will be about 4,200,000. President Diaz, of Mexico, now declares that, in his interview last week with the representative of a New York neswpaper, he said nothing about federation and a joint protectorate. There are indications, however, that he holds the opinions which were ascribed to him in the published report.——It has been said that amendments adopted by the Dominican Congress would necessitate a resubmission of the treaty with Santo Domingo to the Senate at Washington. Late reports show, however, that there were no amendments, altho several explanatory paragraphs were attached to the agreement. A second ratification at Washington will not be required.

The Vinegrowers of the Midi

The depression in the wine trade, threatening practical ruin to certain departments in the south of France has produced extraordinary demonstrations against the Government. The departments immediately concerned are the four along the Mediterranean shore next to Spain—Herault, Pyrenees Orientales, Aude and Gard. The land here is almost exclusively devoted to viticulture, and there has been of late years a great falling off in the demand for the wines of this region, which is in part due to new methods of manufacturing cheap wine. After the first pressing, the grape skins are wet up and extracted a second and even a third time, with the addition of sugar for fermentation. A great deal of wine is also manufactured artificially from the cheap alcohol of the beet-sugar factories. Threatened with the complete destruction of their sole industry and even with starvation, the people are assembling in immense numbers to demand of the Government relief from taxation and the suppression of synthetic and adulterated wine. Marcelin Albert, a peasant vinegrower from an insignificant village, has come to the front as a leader of the movement, arousing the people with his Southern eloquence and organizing them for action in the most efficient manner. At the instigation of his committee the peasants have turned out in mass, leaving their villages to parade to the principal towns. Demonstrations in Beziers and in Perpignan in both cases included over 100,000 men, women and children. Trains were run from all parts at intervals of a few minutes, but these and other conveyances were entirely inadequate to carry the crowd. Thousands walked in, even from a distance of 30 or 40 miles, carrying their own food. The town of Capestang, with 6,000 inhabitants, sent a delegation of 4,600, and Argeliers, with a population of 1,100, sent 1,000. Peasants wore their characteristic native costumes and many were in mourning. Musicians of all kinds were utilized to provide bands for the parade. Flags and banners were numerous, bearing such inscriptions as these: "Death to the fakirs," "The Midi is aroused," "Tools for sale," "We will wait only till June 10th." In the delegation from Cruisson marched fifteen mothers with babes at the breast. So far the leaders have kept the demonstrations from serious disorder, but, considering their extremity and temper, it is not expected that the people can be long restrained from more violent measures. Premier Clemenceau ordered troops to Perpignan, altho Albert telegraphed him that it was a great mistake, as they would not be needed. At Beziers, however, a few days before, a mob formed and sacked the police station, and soldiers had to be called upon to drive them out. Taxes are due next month and many of the villages have declared that they will not pay them. At Narbonne the people unanimously refused to vote in the municipal election. There were no candidates and the election official did not appear. The Mayor of Narbonne declares that if Parliament does not take measures to relieve them, he and the entire City Council will resign. Other towns are expected to follow the same policy of passive resistance, preferring to be without government rather than to pay taxes.

Clemenceau Triumphant

On the reassembling of the Chamber of Deputies the Government received the expected attack from the Socialists, who denounced the repression of the May Day demonstrations and the dismissal of the Government employees who have been organizing unions to affiliate with the General Federation of Labor. The Socialists claimed that Government employees had a right to form unions to protect themselves against the favoritism and tyranny of their superiors, and that the Government had failed to recognize any of its promised reforms, because all its energies were devoted to attacking workingmen. Minister of Education Briand, in reply, declared that he was, as he always had been, a Socialist, but that he was not an anarchist, and that the Government had acted in the true interests of both the Republic and the workingmen in opposing the violence and tyranny of the General Confederation of Labor. The Government, so long as it was retained in office, would resolutely resist any attempt at insubordination and revolutionary activity on the part of school teachers or other employees of the State. Premier Clemenceau's reply to M. Jaurès was characteristically frank and determined, as the following quotations indicate:

"There has been much eloquence, much lightning and much thunder, but the weather has spoiled the powder of all the gods, and I beg you not to be terrified. Why all this to-do because we have dismissed refractory functionaries, anti-militarists and anarchists? The principal question is to know whether the majority is with the Government. If we quit power we will quit cheerfully, and those who replace us will do so cheerfully. [Laughter.] The efforts of functionaries to form syndicates constitutes an act, as the revolutionary M. Jaurès himself says, which forms a point of departure for the transformation of society. These associations which are formed for a defiance of the law we cannot tolerate."

"The Confederation of Labor, of which I am an adversary and enemy when I examine its anti-militarist, anti-patriotic and anarchist propaganda, includes 3,000 workmen's unions. Certainly these unions are not anarchist, or you would not have seen a peaceable May Day.

"I have been at pains to inform myself and assure myself that these unions comprehend excellent elements, unfortunately terrorized by a minority, where 80,000 members are represented as speaking thru the voices of five or six men. We have been misconstrued by those who have seen in our acts an attempt to smash the unions like a bull in a china shop. We have only wished to show the union syndicates the dangers of ways of violence in which some of them engage.

"But I cannot tolerate appeals to murder and pillage. We expect to progress by other means than violence and wholesale expropriation. It is not a crisis of government, but a crisis of the majority of the Chamber which presents itself at this moment, and the Government would rather have a reduced majority, composed of men of spirit, than an enlarged majority. Let those, then, who are not satisfied vote against us without fear.

"I have answered MM. Deschanel, Ribot, Jaurès and others. I turn now to the Radicals and say, Are you not satisfied with the democratic reforms we bring? Why, then, these conventicle secrets? Why these plots under the breath? I have had enough. I do not wish to be strangled by mutes of the harem. Stand up and speak out, Messieurs les Radicals. I await you."

The response to this was a vote of confidence in the Government of 351 to 213.

——The budget estimates for 1908 amount to a total of $770,800,000, which is $4,000,000 more than the budget of last year, notwithstanding rigid cutting down of expenses in many directions.

Russian Affairs

It appears that a dangerous plot for the assassination of the Czar has been discovered, but the authorities have so far refused to give out details. The unusual feature is that the conspirators were members of the Czar's own Cossack guard at the palace of Tsarskoe-Selo. A Cossack sergeant became alarmed and confessed that he had received a large bribe from the Terrorists to admit a large body of conspirators thru the gate in his charge. The police has been very active recently in breaking up revolutionary organizations. In a Finnish village five miles from the Russian frontier a school of applied chemistry was found in which a group of young Terrorists, some of them university students, were being taught how to manufacture bombs. Eight powerful bombs of a type similar to that used in blowing up Premier Stolypin's villa were seized. The Finnish Senate, in compliance with Russian demands, has established a passport system to prevent the return of the delegates to the socialist congress now meeting in London. A raid on the headquarters of the Social Democratic group of the Duma resulted in the capture of thirty-eight revolution-

ists. It is expected that the Premier will endeavor to force the Duma to declare its abhorrence of the methods of terrorism under threat of dissolution as a revolutionary body if it fails to take such action. The Council of the Empire, which may be considered the upper house of the Russian parliament, has rejected the bill passed by the Duma abolishing the field courts-martial. On account of the robbery of a mail wagon in Lodz the Cossacks invaded a cotton mill opposite the post office and cut to pieces the managers, bookkeepers and clerks found at the entrance. Then, passing into the workshops under cover of the noise of the machinery, without warning, they fired volley after volley thru the rooms, killing or wounding about seventy-five men and women working at the looms.——The meeting of the Russian Socialists in London is carefully guarded from Russian spies by the system of passwords and grips, and very little information is given out. They are divided into two general factions, the Majorites (said to number 83), who were in favor of an immediate attack upon the Government by an armed rising, and the Minorites (79), who believe in adopting a more moderate policy of securing what concessions can be wrested from the Government and in the meantime organizing the workingmen. Besides this there are the racial revolutionary groups, the Poles (39), Letts (24) and the Jewish Bundists (54). There are thirty women delegates, most of them very young. At one session addresses were delivered by Ramsay MacDonald, M. P. (Socialist), Mr. Quelch, of the British Social Democratic Federation, and Rosa Luxemburg, on behalf of the German Social Democrats.

Women's Education in Germany

The University of Jena has opened its doors to women on equally the same footing with men, making the eighth in the twenty-one universities of the Fatherland, and following the three of Bavaria, namely, Munich, Erlangen and Würzburg; the two of Baden, viz., Heidelberg and Freiburg; that of Würtemberg, Tübingen; that of Alsace Lorraine, in Strassburg; and that of Saxony, viz., Leipzig. Prussia, which generally takes the lead in educational matters, has stubbornly refused to open any of its ten universities to women for matriculation or graduation. However, this is evidently on the way, according to the reform for girls' schools which Minister von Stadt recently laid before the Prussian Diet. According to this the regular ten years' course in the girls' schools is to be followed also by a four years' special course in the Lycées, which the State proposes to establish for girls, which course is to be modeled, as far as possible, after that of the boys' gymnasia and scientific school and to lead up to the university. In Berlin, the women's contingent has increased from 96 ten years ago to 783 during the past semester, of whom 601 are German subjects. The situation is thus not the same as in the Swiss universities, where of a total of 2,101 medical students no less than 1,171 are women, but the great bulk of these are Russian Jewesses. The proportion of women students in Germany is less than in France, where out of a total of 38,197 university students, 2,259 are women, but of these 1,195 are foreigners.

Universal Suffrage in Austria

The first general election under the new Austrian suffrage law occurred on May 14th and resulted in a decided change in the constitution of the lower house of Parliament. The overthrow of the German party is complete. The new House of Delegates will be chiefly composed of extremists, for both the Clericals and the Socialists have increased their strength immensely at the expense of the Liberals. In the last House of Delegates the Socialists numbered eleven. In the new House, when the second elections have been held, they may have as many as seventy seats. The Anti-Semites had twenty-six representatives in the old House, and are likely to have sixty-four in the new. Burgomaster Lueger, who has been one of the most violent of the Anti-Semites, was elected as a Christian Socialist from the Vienna Inner Town. The Young Czechs were beaten almost everywhere by Socialists. Altogether the election indicated that party divisions will not be as strictly maintained on

racial lines in the future as they have been in the past. The new suffrage law requires that every qualified person must vote. It has been found that nearly 50,000 voters in Vienna and lower Austria failed to cast their ballots, for which they are liable to a fine not exceeding $3. Under the old régime the system of electing was very complicated, the Lower House of the Reichsrath, the House of Delegates, being elected by four classes; landed proprietors, boards of trade, large cities and citizens in general. It required only sixty-four votes of the first class to elect a representative, while there was one representative for 67,500 of the population in the fourth. Under the new law all male citizens under twenty-four years of age are entitled to vote. Austria is districted in the following manner: The Kingdom of Bohemia is allotted 130 seats, the Kingdom of Dalmatia 11, the Kingdom of Galicia and Lodomeria with the Grand Duchy of Cracow 106, the archduchies of Upper and Lower Austria 64 and 22, the duchies of Salzburg, Styria, Carynthia, Carniola, Bukovina and Silesia respectively 7, 30, 10, 12, 14 and 15; the margravates of Moravia and Istria 49 and 6; the counties of Tyrol and Görz-Gradiska 25 and 6; the land of Voralberg 4; the city of Trieste 5 seats.

The Rumanian Riots

The Rumanian Government is now endeavoring to alleviate the distress caused by the recent agrarian riots and to remove their causes. In order to enable those whose property has been destroyed to resume agricultural operations the Government will make loans to proprietors payable in three years at 6 per cent. interest. The land owners are urged to return to their property and put in crops this spring. At a meeting of some two hundred large landowners, held at Bucharest, the Government was blamed for its failure to protect property by the prompt action of the troops, and a deputation was appointed to wait upon the King to demand that the Government take immediate steps to ascertain all damages and to compensate every one for his losses. The Government is held responsible for the disorders because the agitators were mostly priests and school teachers, who are salaried by the Government. The Jews of Jassy recently appealed to the prefect for protection, but the Prefect declared that he was powerless to save them and advised them to emigrate before they were expelled by force by the peasants.

India

There was serious apprehension in India and England that May 10th, the fiftieth anniversary of the outbreak of the great Indian mutiny at Meerut, would be made the occasion of a native rising, but the energetic precautionary measures of the Government prevented this, if, indeed, there had been such a plan. Large bodies of troops were sent to Lahore, the center of the recent disturbances, and on May 9th Lala Lajpatrai, a pleader in the Punjab Chief Court and organizer of the seditious manifestations, was arrested, together with a number of similar agitators. It is not known where Lajpatrai was taken, but it is thought that he has gone to the Andaman Islands, India's penal settlement. Mr. Morley, Secretary of State for India, authorized the deportation of the agitators and defended it before the House of Commons as a necessary measure in view of the emergency. General Lord Kitchener, Commander-in-Chief of the British forces in India, declares that the seditious movement has not affected the native troops. The Sikhs of Lahore have declared officially that they have no sympathy with the Hindu agitation. The Mohammedans also as a rule have taken no part in it, but in Eastern Bengal Hindus and Mohammedans joined together in plundering and burning the villages of Mymen Singh. Even the southern parts of the Indian peninsula have not been free from disorder. The ravages of the plague continue and add to the alarm and disaffection of the natives. During the first three months of 1907 there were 495,000 deaths from the plague. During the week ending April 13th there were 87,161 cases of plague and 75,472 deaths. The Earl of Minto, Viceroy of India, has prohibited meetings for the discussion of political affairs without a week's notice being given to the authorities, who are empowered to forbid them. Promoters of unauthorized meetings and those who participate in them will be punished by imprisonment or fine.

With Agassiz at Penikese

BY DAVID STARR JORDAN, LL.D.

[On the 28th of May will be celebrated the centenary of the birth of Agassiz. We are fortunate in being able to give to our readers the following recollections of the great naturalist by one of his pupils, now president of the Leland Stanford, Jr., University, California. It is of interest to mention that lately the famous island of Penikese has been purchased by Massachusetts, to be used for a leper colony after the fashion of Molokai, in Hawaii.—EDITOR.]

IN all of Agassiz's career, dramatic, devoted, impulsive, emotional, bubbling with enthusiasm as he always was, there was no more dramatic and no more characteristic scene than the one Whittier has described in his poem, "The Prayer of Agassiz."

Agassiz was of the rare type of scientific man who worked because he loved to work, just as he loved to sing, or to play games, or to climb mountains. The study of nature was the joyous expression of the play impulse, and from this arose his overwhelming influence in stirring up enthusiasm among his students.

And so it chanced that fifty of us, young men and young women of thirty years ago, were gathered in June, 1873, in an old barn on the island of Penikese, to study nature and to catch the enthusiasm of the robust life of this man, a leader of an earlier generation of naturalists, and who yet was always younger than any of his students.

The old barn on the little forgotten island was hastily adapted for a dining hall and lecture room. The lecture and the dinner went together. At the end of one of the three long tables, a movable blackboard always by his side, sat Agassiz, and when the dishes were being cleared away, the lecture would begin. One day we had scup for breakfast, and the lecture was on the osteology of *Stenotomus*, while the bones of the fish we were to study lay nicely cleaned about our plates.

It was on the second morning that occurred the memorable incident of the summer.

He arose as the dishes were taken out, this time without chalk in his hand, and began to speak, with that wonderful touch of eloquence which is denied to most men of science, of his purpose in calling us together. The swallows flew in and out of the building, grazing his shoulder in their flight. He told us that the people of America needed a better education, one that would bring them in closer contact with the realities of nature, and therefore with truth. He told us how this training of people to think clearly and rightly and righteously ought to be accomplished, and he dwelt on the results which might come to our country from the training and consecration of fifty teachers, young men and young women armed with enthusiasm and with youth on their side.

This summer at Penikese was to be no ordinary piece of school work, still less a merry summer's outing. We were there for a mission work of the highest possible importance. He spoke with intense earnestness and with great dramatic power, and this was hightened by the deep religious feeling so characteristic of his mind. For to Agassiz each object in nature, as well as each law of nature, was a thought of God, and trifling thoughts and conduct in the presence of God's ideal expressed in nature was to him the most foolish form of sacrilege.

What Agassiz actually said that morning can never be said again. No reporter took his language, and no one after all these years can call back the charm of his manner or the simplicity and impressiveness of his zeal and faith. At the end, he said abruptly as he sat down, "I would not have any one pray for me now." For a moment we were surprised, not knowing what he meant. Then it flashed over us that he wished to say that he would not like to call on any one else to pray instead of him. And he concluded with the hope that each one of us would utter his own prayer in si-

lence. Whittier has perfectly described this scene:

"Even the careless heart was moved,
And the doubting gave assent
With a gesture reverent
To the Master well beloved.

As thin mists are glorified
By the light they cannot hide,
All who gazed upon him saw,
Thru its veil of tender awe,
How his face was still uplit
By the old sweet look of it,
Hopeful, trustful, full of cheer
And the love that casts out fear."

And after this, during the summer at Penikese with its succession of joyous mornings, bright days and calm nights, with every charm of sea and sky, the master was with us all day long, all the time ready with help and encouragement, always ready to draw on his own wide experience in Europe and in America, always ready to give us from his own stock of knowledge. Whatever he said was translated into language we could understand, and to be intelligible is the best mark of the great teacher. The boundless enthusiasm which surrounded him like an atmosphere was always present. In this atmosphere relative values were sometimes distorted, and little discoveries and little achievements appeared very large when seen in its light. But all this was good for us, for the world has plenty of means of taking away delusions. He was always an optimist, and a large part of his strength lay in the realization of the value of the present moment. The thing he had in hand was the one thing best worth doing; the people around him were the men best worth helping, and "the bit of sod under his feet" was "the sweetest to him in this world, in any world." Picturesque and dramatic he was in every situation, as befits the race from which he sprang. He rejoiced in the love and approbation of students and friends, and the influence of his personality was thrown into every scientific discussion. This, again, has been a matter of criticism, but it was helpful to us. With no other leader of science has the work and the man been so unified as with Agassiz. No other great investigator was ever so great a teacher, and, perhaps, after all, notwithstanding the hundreds of memoirs, large and small, which he contributed to technical natural history, it may be that the greatest impulse he gave to science was thru his influence on other men. He was a constant stimulus and a constant inspiration, and no greater testimony to his power as a teacher can be asked than this.

While Agassiz was thoroly opposed to Darwinism, and Darwin called him "his most courteous opponent and most formidable," yet every one of the men trained by Agassiz in biological research has joined the ranks of the evolutionists. Agassiz believed in absolute freedom of the mind, for no power on earth can give answers beforehand to the problems science has to solve. He trained his men to think for themselves, not to think as he did.

Of all his lectures to us, the most valuable and the most charming were those on the glaciers. In these the master spoke. He knew Switzerland as well as he knew the Harvard yard, and every rock of the glacial moraine, which made our island, was a mute witness to the truth of his stories.

Equally delightful were the reminiscences of his early life in Neufchâtel, in Munich, and in Paris, and his memories of the great workers in science with whom he had been associated. Above all the rest he placed the three men he acknowledged as masters, Cuvier, Humboldt and Döllinger. "I lived at Munich," he once said, "for three years under Döllinger's roof, and my scientific training goes back to him and to him alone."

He often talked to us of the Darwinian theory, to which, in all its forms, he was most earnestly opposed; and yet, his opposition carried with it the underlying feeling that if he had been thirty years younger, his life philosophy yet to be developed, he would have been found in the front rank of those who believed in the derivation of species; in this case, he would have stood among those who would look for other causes of this derivation than those purely physical and mechanical. Agassiz once said to me that thirty years before he had been "on the verge of anticipating Darwinism," he had been thrown off the scent by a slight misunderstanding, not of fact, but of phil-

osophical interpretation of facts concerning the succession of fishes, which he had himself discovered.

Agassiz was an idealist. All his investigations were to him, not studies of animals or plants as such, but of the divine plans of which their structures are the expression. "That earthly form was the cover of spirit was to him a truth at once fundamental and self-evident." The work of the student was to search out the thoughts of God, and as well as may be to think them over again. To Agassiz these divine thoughts were especially embodied in the relations of animals to each other. The species was the thought-unit, the individual reproduction of the thought in the divine mind at the moment of the creation of the first one of the series which represents the species. The marvel of the affinity of structure—of unit of plan in creatures widely diverse in habits and outward appearance—was to him a result of the association of ideas in the divine mind, an illustration of divine many-sidedness. To Darwin, the relation of forms one to another illustrates the results of individual variation repeated thru the force of heredity and acted upon by the influences of selection and segregation and other results of varied and inevitable environment.

Agassiz never doubted the sufficiency of his own philosophy. His mind was not constructed for philosophic doubt. In this confidence in his own methods, his own mental and physical resources, lay his strength and his weakness as a philosopher.

In the same year, December, 1873, after the end of the first and worthiest of all summer schools of nature, Agassiz died. In the words of one of his students, Col. Theodore Lyman,

> "We buried him from the chapel that stands among the college elms. The students laid a wreath of laurel on his bier, and their manly voices sang a requiem. For he had been a student all his life long, and when he died he was younger than any of them."

The next summer we came together again, the students of the first year, with many new ones eager for the experience which had been so inspiring to us. The island was there, the sea, the sky, the living creatures, but Agassiz was not, and there was all the difference in the world. We met one evening in the lecture hall, and each of us said the best he could of what Agassiz had been to him. The words that lasted longest were these of Samuel Garman, of Harvard, "Agassiz was the best friend that ever student had." We put on the walls these mottoes, written on cloth, and taken from Agassiz's lectures:

Study nature, not books.*
Be not afraid to say: "I do not know."
Strive to interpret what really exists.
A laboratory is a sanctuary which nothing profane should enter.

These mottoes remained for fifteen years on the walls of the empty building, whence they were carried as precious relics to the laboratory at Wood's Hole, which has been the lineal descendant of the school at Penikese.

At the end of the summer of 1874 the authorities of the museum closed the doors of the school at Penikese forever. They had no choice in the matter, for no college could be found which would spare the small sum needed for its maintenance. No rich men came forward, as others had done before, to the assistance of Agassiz in his lifetime, men who would not stand by "to see so brave a man struggle without aid." For nearly twenty years the buildings stood on the island just as we had left them in 1874. An old sea captain, the skipper of the "Nina Aiken," was in charge of them until the winter of 1891, when he was drowned in a storm. A year or two later the buildings were burned to the ground, perhaps by lightning.

But while the island of Penikese is deserted, the impulse which came from Agassiz's work is still felt in every field of American science. With all appreciation of the rich streams which in late years have come to us from many sources, and especially from the deep insight and resolute truthfulness of Germany, it is still true that the school of all schools which has had most influence in the development of enthusiasm in scientific teaching in America was held in an old barn on an uninhabited island some eighteen miles from the shore. It lasted but three months, and in effect it had but one teacher. The school at Penikese existed in the personal presence of Agassiz; when he died it vanished.

* The whole sentence was: "If you study nature in books, when you go out of doors you cannot find her."

STANFORD UNIVERSITY.

King Leopold's Views on the Kongo Question

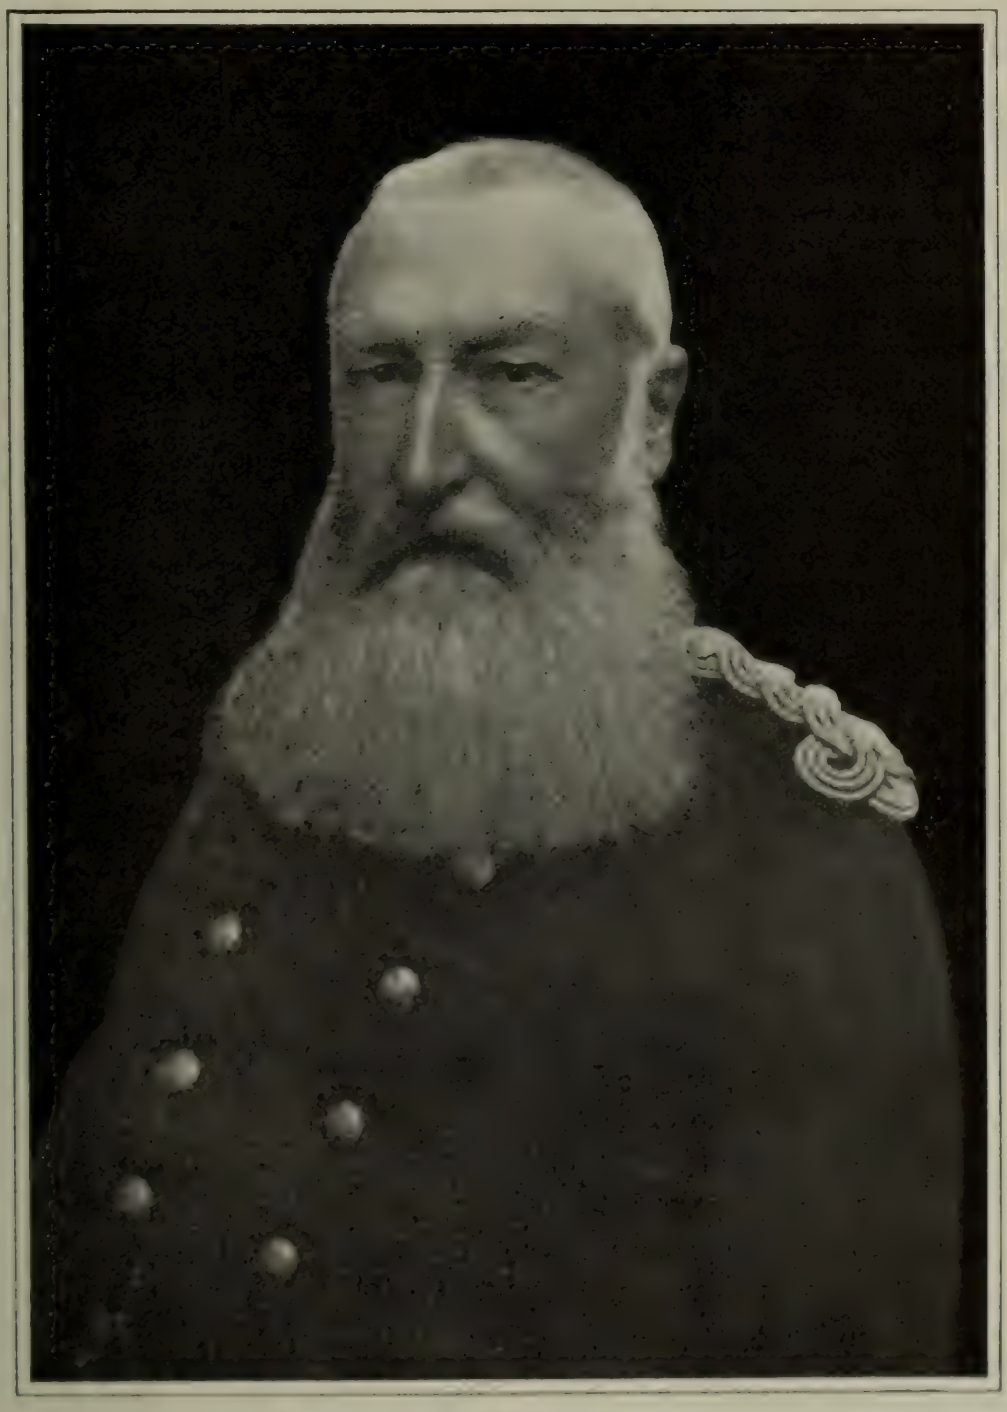
BY M. VAN HOESEN

[The writer is Secretary of the Federation for the Defense of Belgian Interests in Foreign Countries, and we are authorized to state that if etiquet permitted King Leopold to express his views in a periodical, concerning the Kongo controversy, they would be those which follow.—EDITOR.]

FIRST a word about the sovereign position of the Kongo Free State. According to the anti-Kongolese party the State is the creation of the Berlin Conference. This is a mistake. The Kongo State is not the creation of the Berlin Conference, because it existed before the conference was even thought of. What is the proof of this? The Berlin Conference opened on November 15th, 1884. But on April 22d in that year the United States had recognized the International Association of the Kongo as "a properly constituted state." The next day France did the same. On November 8th—that is, one week before the conference met, Germany recognized the Association as "an independent and friendly state." The Conference then met, but long before it had come to any agreement, Great Britain, on December 16th, and Italy on December 19th, recognized the new state as independent and sovereign. On February 23d, 1885, three days before the signing of the Berlin act, Colonel Strauch, president of the International Association, informed the conference that almost all the Powers (thirteen out of fourteen) had recognized "its flag and status as a friendly and sovereign state." Therefore, what "existed before" could not be "the creation of" the Berlin Conference.

Our critics say that the Kongo State owes its existence to the Powers, but this is not so either. The Kongo State does now owe its existence to the Powers, because it had come into existence before any of them recognized it. In April, 1884, the United States and France did not recognize a shadow, but a fact. When they said that the flag of the association was entitled to recognition as that of a "friendly and sovereign state" they had in their eye the work done and actually accomplished. What was that work? It was represented by the efforts from 1876 to 1884. The evidence of the leading statesmen at the Berlin Conference on this point is conclusive.

Prince Bismarck said: "All of us here render justice to the lofty object of the work to which His Majesty the King of the Belgians has attached his name; we all know the efforts and the sacrifices by means of which he has brought it to the point where it is today." Baron de Courcel (France) said: "The new state owes its origin to the generous aspirations and the enlightened initiation of a Prince surrounded by the respect of Europe."



Count di Launay (Italy) spoke in the same sense. Sir Edward Malet (Great Britain): "The part which the Queen's Government has taken in the recognition of the flag of the association as that of a friendly government warrants me in expressing the satisfaction with which we regard the constitution of this new state due to the initiative of His Majesty the King of the Belgians."

From the four leading participants in the conference came, therefore, the unanimous avowal that the Kongo State was created by the efforts, sacrifices and initiative of King Leopold.

What one conference has given another can take away, say our critics. Our reply is that as the Berlin Conference did not give the Kongo State its existence, no other conference of the signatory Powers could take it away. The American Secretary of State's letter of February 20th, 1906, clearly shows that the American Government recognizes the sovereign position of the Kongo State, and that no other Power has a right to interfere in its internal affairs. The British Government has never attempted

to meet this point, and has left the arguments of Professor Nys in 1903 in support of this thesis unanswered, solely because they are unanswerable.

I come now to the question of "atrocities." Our enemies say that "mutilations, and especially hand-cutting, began with the collection of rubber." But this allegation is refuted by the evidence anterior to the appearance of Belgians in Central Africa showing that mutilations, and especially the cutting off of a limb (hand, foot, ear, woman's breast, etc.) were common forms of punishment among the blacks. The following reference will suffice: "For the least offense they cut off a finger, a lip, etc.; for more serious they cut off the hands." Lovett Cameron, "Across Africa," published in 1876.

KING LEOPOLD.

They further assert that the Casement report supplies proof of these "atrocities." Now, the Casement report was, and, perhaps, still is, the chief proof relied on as to "atrocities." It, therefore, calls for special notice as being (up to

the present) the one official compilation of what purports to be evidence. The Casement report is contained in Parliamentary Paper (Africa, No. 1, 1904). There are numerous references in it to alleged cases of cruelty and mutilation, but, by the admission of the Consul himself, these cases can only be matters of *hearsay*, because on page 58 he writes in reference to the boy II (subsequently identified as Epondo): "In the only case which I was able *personally* to investigate." Mr. Casement's proof then relates solely to the Epondo case. The value of his testimony, his credibility as an inquirer after truth, must stand or fall by that incident.

What are the facts? On pages 56, 58-9 and 78-9 of his report Mr. Casement records his examination of the boy, his hearing of evidence and his dogmatic conclusion: "I found this accusation proved on the spot without seemingly a shadow of doubt existing as to the guilt of the accused sentry." It is true that he records that the sentinel denied the charge, but he brushes that denial loftily aside. (See page 79.)

HATENDE,
Chief of Jafunga village.

After Mr. Casement had departed a rumor got about that the boy had been lying, and as the sentinel stoutly denied his guilt, a *juge de première instance*—Baron Bosco, an Italian—was sent to make an inquiry into the matter, and he re-examined the boy Epondo, and took independent evidence, with the result that Epondo withdrew his statement and admitted that he had lost his left hand in consequence of the bite or wound of a wild boar when accompanying his master on a hunting expedition. A subsequent surgical examination of the arm resulted in the conclusion of the surgeons that the cause of the lost hand was a wound inflicted by some wild beast.

The matter was gone into again by the Commission of Inquiry, and it came to the conclusion (see page 89 of its report) that "Epondo really did lose his hand as the result of a bite from a wild beast." Moreover, an English missionary (Rev. —— Weeks) stated that this was known to be the case in Malele, Epondo's native village, as he had himself verified during a recent visit.

It is, therefore, proved up to the hilt that Mr. Casement, in the one case that he personally investigated, and about which he declared that there could not be a shadow of a doubt, was completely wrong and entirely misled. It was not a case of cruelty nor an atrocity, but merely an accident.

While this is now generally admitted, the consequences that flow from the collapse of the Epondo case are not taken into account. The proof thus furnished of how easily Mr. Casement was deceived and how rapidly he came to conclusions unfavorable to the Kongo Government deprives the Casement report of all value.

In the course of the lectures and addresses which Mr. Harris is delivering thruout England, he refers to hundreds and even thousands of cases of cruelty and atrocities. At the Regions Beyond Mission meeting of March 26th he spoke of "one case out of a thousand that he had on his records." He also referred to a wonderful diary of his, in which he had recorded thousands of cases. But on turning to the report of the Inquiry Commission it is only recorded (page 89 of translation) that "the Rev. Mr. Harris showed us at Baringa Isekosu and the woman Boali, the first having lost his right hand, the second her right foot."

More important. At the anti-slavery meeting on March 29th, Mr. Harris admitted that he could not give the dates of certain cruelties that he described, re-

plying vaguely in 1902 or 1903, and that he had never himself seen these acts of cruelty, which he only knew about secondhand from the blacks. His stories of atrocities are consequently based on hearsay and secondhand evidence. It must occur to every one that he may have been misled and deceived just as Consul Casement was in the Epondo affair.

The conclusions of the commission on the subject of mutilations, expressed in grave and weighty language becoming the seriousness of the matter, are entitled to consideration. They furnish the real refutation of the sensational account by Mr. Harris of cruelties and atrocities which he admits he never saw:

"The observations made by the commission, the evidence taken, and information obtained combine to prove that the mutilation of dead bodies is an ancient custom among the natives, and one which, to their eyes, does not appear as profane as it does to ours. The fact of cutting off certain parts of a dead body simply satisfies the natives' desire of possessing a trophy or some proof of prowess. It was common practice to mutilate fallen enemies in the wars between the tribes of certain regions. Even now, if natives wish to prove that one of their family is dead and either cannot or will not produce the body, they simply show the official in authority his hands or feet. One point, however, is undisputable: no European ever inflicted or ordered such mutilations to be inflicted on living natives as punishment for shortage of labor tax or any other offense. Not a single witness testified to occurrences of this nature, and we failed to come across a single case during the whole course of our investigations."

The law of the Kongo State is as clear on the points of murder, cruelty, cannibalism and mutilation as the law of any civilized government, whether British or Continental. The penal code is as stringently enforced against white offender as it is against black. The fact that there is crime on the Kongo only shows that it resembles England, Belgium, France and other countries in being inhabited by peccant human beings and not by saints. If there is unpunished or even undetected crime on the Kongo, it only completes the analogy between it and, for the sake of comparison let us say, England. But the Government is to be judged by its code and the honesty of its judges, whom the bitterest enemy of the Kongo has never attacked, and not by the failure of its officers to discover the authors of every crime or illegal offense.

And now a final word in order to dispose of the charge that we are "rubber" or "nigger-killers." Our opponents say on this point:

"It is the system of *making* the natives collect rubber that we attack. The profits of the Kongo State are derived from rubber, 'red rubber,' because all the atrocities are committed in collecting it. Sir T. Fowell Buxton, at the anti-slavery meeting on March 29th, threw some light on the motives of those who desire to see the natives free to collect the rubber and sell it to outsiders. 'Rubber has become most valuable. It is an article of necessity for many increasing manufactures, such as the tires for motor cars and cycles.'"

Our reply is that all governments have to derive the support necessary for their existence from taxation. In the Kongo State the chief resource up to the present has been rubber. In British Colonies in Africa it is alcohol, more definitely the coarse raw spirit known as "nigger-killer."

Which is the more open to objection, rubber, that does no harm to any one, or alcohol, which debases and kills the negro? Moreover, rubber was unknown to the native. In the Lower Kongo his improvidence resulted in the destruction of the trees. In exploiting rubber it is clear that the Government is not robbing the native of what he possessed. It is an entirely fresh source of revenue, which only became very valuable about 1892. It is one of the most innocent and inoffensive sources of revenue to be found in the world.

In this respect the contrast with opium in India and alcohol in Nigeria is very striking. To keep to Africa, the import of alcohol into Nigeria and Lagos represented about 80 per cent. of the revenue of those colonies. In reply to several questions asking for the stopping of this traffic, the British Government has replied that it is impossible to stop it because the revenue from this traffic alone enables the administration to be carried on. Still no one denies that in this part of West Africa raw spirit is debasing the native and proving a veritable "nigger-killer."

There is a passage in the Inquiry Com-

mission that deals effectively with this very point:

"We consider that the prohibition of the spirit trade and the suppression of slavery are the two chief claims of the Kongo State to glory. Humanity in general must always be grateful to the Kongo Government for having refused to make use of the powerful factor so many others used, as thereby a scourge even more terrible and disastrous than the slave trade was averted from the Kongo."

The Kongo Government not merely declines to derive any revenue or profit from a traffic in alcohol, but it absolutely prohibits the import of spirit in any form into any part of the Upper Kongo, that is to say above the river Mpozo, which enters the Kongo a mile or so above Matadi.

But it may be said that if these two systems are both bad, there is still another which is a good one. What is it? Will some one point it out? Is it the hut tax? Remember what happened in Sierra Leone in 1898. Is it the poll tax? Look at the occurrences in Natal at the present time. What is beyond dispute is that all taxation in savage countries is difficult—then let us have fair play.

BRUSSELS, BELGIUM.

An Indian Hurricane

BY JAMES H. WILLIAMS

[Here is another true "yarn" from our old sailor friend, James H. Williams. Mr. Williams is for the present in New York City, and may be found almost any day at the headquarters of the Atlantic Coast Seaman's Union in South Street.—EDITOR.]

NEVER shall I forget that strenuous Sunday, that fearful, fateful Easter Sunday, the 5th of April, 1890; when the terrific windstorm blew across the Indian Ocean; when two of the best built men-of-war and three modern mail boats were literally swamped; when a score of stately merchantmen were driven into the solitary depths, and hundreds of able seamen lost the "number of their mess." I am not much of a church member, and I don't study movable festivals, but if you will take the trouble to read the almanac for that year I think you will find I have got the date right, for it is so indelibly impressed upon my memory that I can never forget it.

I was out in that storm, and weathered it, with the worst bunch of raniks that Paddy West ever sent to sea.

I was about twenty-six years old then (ladies, please forgive me), and I just gloried in storms.

Fine weather never made a good sailor. I was in the ship "Restitution" at the time, a Blue-nose clipper, hailing from St. Johns. Her captain's name was Hurley, one of the worst brutes that ever crossed blue water.

He carried his wife with him; she was the owner's daughter, and the dearest and sweetest little creature in petticoats that ever graced a ship's poop. It may be wrong to say so, but I fear it is true, that I loved her better than Hurley did, and I am sure she had more respect for me than she had for him.

I was only a plain sailor before the mast, and whatever I did that day I did for her sake, for a man will gladly risk his life for whom he loves.

In the forecastle we had eighteen hands and fourteen languages, and only four men who could steer.

In heavy weather we only had one man that could steer, so while we were running our Easting down I spent all my spare time, which was nearly all the time, at the wheel.

The "Restitution" was a timber ship, built at St. Johns. She had the heaviest breast hooks, the highest sister keel and the sturdiest frames of any ship I ever knew.

She also had a "swallow-tail" stern and the biggest and clumsiest old-fashioned windlass ever built; the same kind Noah invented when he built the ark. She also had tiller ropes instead of the

modern patent steering gear, and you had to use yourself some at her wheel to keep her straight. That's the reason some of the boys couldn't steer her; they were not strong enough to give her helm in time.

She had sturdy pitch pine masts, with sixteen bands, a splendid gang of lower rigging, and bows like Sheba's breasts.

She was not what we call a handsome ship; she was built to carry, rather than to sail, and she was full to the hatches with case oil.

The mates were a pair of huge, unflinching bull-dozers, and they hunted and hounded the crew to desperation. Yet they were both splendid seamen, and always treated me with respect; and, I think, all hands would have been treated better had all hands been sailors.

The most sensitive barometer in the world is the human barometer.

A sailor can always tell when a great storm is brewing by the tingle of his nerves, by the color of the sky, the oily smoothness of the sea, the strong smell, like gurry-weed, and the low flight of the molly-hawks and gonies.

Such were the conditions the day before Easter Sunday, 1890.

All that day we drifted along, in company with two other ships, over the glassy sea, an American ship and a German bark, and all day long we kept within signaling distance. But we all knew a cyclone was brewing and did our best to prepare for it.

On our ship we bent a brand new main lower topsail. Of "oo" cotton canvas it was made, the strongest fabric known, and sewn onto hempen bolt ropes as thick as a man's arm.

At eight o'clock that night, Mr. McElroy, the second mate, came forward and met me outside the starboard forecastle door. His voice was calm and subdued and his manner was grave and solemn. "Jim," he said, "there's a terrible storm coming up and we can't get out of it. Try to get the crew together and we'll shorten her down before it strikes. The glass is down in the chain locker."

So we got together, as well as we could, and shortened her down; then we watched a-wait for the coming roar. During the night we had a constantly rising sea, but no wind. The mighty tempest was pushing the whole ocean ahead of it.

When we went below, at four o'clock in the morning, the storm had not struck us yet, but, except for the main lower topsail, full set, the ship was under bare poles.

About ten minutes after we got below we heard a tremendous commotion on deck; the ship's bows arose in the air until she seemed to stand on her stern post, and we heard a heart-rending cry, which told us that some one was in mortal anguish.

The ship had "pooped" before the ever-increasing on-rushing sea, because she had no wind to drive her out of the smother.

A tremendous sea had breached across her stern, from aft forward, washed away everything movable about the decks, dashed the two men at the wheel overboard, and crushed one poor fellow to death against the starboard bulwarks.

I rushed out of the forecastle door and started aft for the wheel. Just as I got into the narrow alleyway, between the after-house and the waist, I encountered the big wooden binnacle, with the compass and clock and the upper half of our wheel broken off at the spindle.

This group of furniture, drifting on the crest of an on-rushing sea, struck me full and by, and naturally knocked me down, but it didn't kill me, and as soon as I could recover from the collision I climbed the poop ladder and took charge of the broken wheel.

Ten minutes later the cyclone struck us, butt end on, and hove our sturdy ship down to her rails. The force of the wind was so terrific that no man could speak. It seemed to blow from all points of the compass at once, and the sea suddenly swirled up into mountainous heaps of crested smother and boarded us in all directions.

I pulled off my sea boots and threw them away, in order to get a decent footing on deck in my stocking feet.

Altho we were within the Tropic of Capricorn the temperature fell amazingly, and the weather suddenly became cold.

A hurricane is a revolving storm. It may be a mile or a hundred miles in ex-

tent, but its peculiarities are ever the same. It revolves with terrific rapidity and force and at the same time travels ahead with amazing speed, precisely as the earth spins on its axis and follows its given orbit at the same time.

But there is a law of storms as well as a law of motion, and it is part of a seaman's business to know those laws. It is an established law of nature, well known to navigators, that in the Northern Hemisphere a cyclonic storm will always revolve from left to right, while in the Southern Hemisphere it will always revolve in the contrary direction—from right to left. Why this *is* so we cannot say, but knowing that it is so we handle our ship accordingly, and the law of the elements has never failed us yet.

Ergo, if you ever get caught in a hurricane north of the equator, heave your ship to on the port tack; if south of the equator, heave to on the starboard tack.

Lay a watch, a chronometer or marine clock down on the table, face upward, and observe the trend of the hands. A northern hurricane will revolve with the hands, but a southern storm will revolve against them. Such is the law of storms.

A ship hove to drives sternwise and sideways; therefore, our judgment tells us to lay her on the tack whereon the tendency of the wind will be to force her toward the margin of the storm. A ship on the wrong tack will be sucked into the center of the tempest, and in the vortex of an able-bodied hurricane no ship can live.

The average life of a cyclonic storm in the open sea is about sixteen hours. Sometimes it may be diverted from its course or caused to collapse by meeting an immovable obstruction—an island, for instance. But we were away to the northward of Saint Paul and Amsterdam, heading for the Straits of Sunda, and there was nothing to obstruct our hurricane. So it hurled and swirled and blew and raged for full thirty hours, from four o'clock Sunday morning until ten o'clock Monday forenoon.

By that time our ship was almost a wreck, and had the storm continued a little longer I would not have been here to write about it.

When the first shock of the big storm struck us, the raniks bolted into the forecastle to a man, like the cowardly cravens they were, and barricaded both doors.

So we were only four hands on deck, outside of the captain and officers and old Aleck Jackson, our negro cook, a thoro sailor from backbone to breakfast time.

We tried to take in the main lower topsail, the only sail we had set. But we did not have men enough to haul up the buntlines, and the sail split with a roar like a cannon the moment we started the sheets.

Then Captain Hurley came out of the cabin and handed me an axe. "Go up, Jim," he said, "and cut down that topsail or we'll be dismasted and lost."

"Aye, aye, sir," I answered, obediently, as I took the axe, "I'll cut her down if I can."

As I was crawling over the iron sheerpole on my way aloft I saw Mrs. Captain Hurley gazing at me with such a pitiful look thru the cabin window, and then I knew I *could,* and I did.

I cut the sail from the yards, tho it was an awful job, and when I came down Mrs. Hurley, still gazing thru the cabin window, paid me for it with a smile.

Our next job was to get our ship to the wind. So we lashed the foot of our leg-o'-mutton spanker to the boom, loosed the brails and hoisted the head about half-way aloft. Then we rolled the broken wheel down and let her come to. Heaving to in a storm is always a dangerous expedient, but it often has to be done. Just as the laboring ship came to the wind three tremendous seas boarded her and hove her down under thousands of tons of water. I could feel the wooden fabric struggling like a live creature under my feet. When she arose she was partly dismasted, her jibboom was gone at the cap, her fore-to'-gallant mast, still clinging by the stays, was pounding her with fearful violence in the sides; the forward house was stove in; all five of our boats and our windmill pump were gone, sheer-legs, skids and all, and four of our craven raniks had been swept into eternity like chalk off a slate.

Fore and aft we did not have a strip

of bulwarks left nor an ounce of movable property left about the decks, and for miles astern the sea was covered with driftwood, the flotsam and jetsam and planking wrenched away from our gallant ship by that awful storm.

By dint of strenuous and exhausting effort we managed to chop away the jibboom guys and to'gallant lanyards and let the crashing spars go adrift.

We had two jury masts and a spare jibboom lashed in the waist. The lashings got adrift and the big spars fetched away and took charge. Oh, heavens, what a mess!

One spar was obliging enough to wash over the side and thereby saved us a lot of trouble, but the other was a terror. It floated endwise and sideways and backward and forward with awful velocity, and there was no way to control it.

But at last, after a two hours' tussle, we got it aimed between two of the timber-heads, where the bulwarks were gone, and getting together on the other end we gave it the grand rush overboard and let it go to sea.

About the same time the spare jibboom got loose from its fastenings, and wafting astern on the crest of a mighty sea it crashed thru the forward cabin like a battering ram, butt end first, drove for fifteen feet of its length into the house, and crushed the steward to death in the pantry.

It afterward became a part of my job to get rid of that big stick.

I went down onto the main deck with a bowline around my waist and got a strap around the spar. Then I rigged a luff tackle to the main-fife-rail, and the men standing on top of the house hauling on the fall dragged the big 21-inch spar out of the bulkhead.

Then I got another strap on the heel of the spar and hooked on the mizzen topsail halyards, and they hoisted the big stick up and dropped it over the stern, and whoever found it had a fine jibboom.

About four o'clock in the afternoon, when everything had been done that could be done for the salvation of the ship, I was sent to the wheel. I was the favorite wheelsman on that ship, and somehow I knew her motions and how to anticipate them better than the rest. The ship was head to wind now, her yards braced in the line of least resistance, and nothing set but the head of her leg-o'-mutton spanker.

I only had half a wheel, for, as I have explained, the first sea that boarded us broke it off at the spindle.

We did not dare to lash the wheel, for fear the sea would destroy our steering gear.

So I had to stand there, lashed to a stanchion, until ten o'clock the next forenoon, without food or water, sleep or relief. And all that live-long Easter night I cursed those raniks from the bottom of my soul, and I curse them to this day.

Sometimes during my long trick little Mrs. Hurley would come to the after cabin window and look out to see if I was still there. And her presence gave me courage; I would look at her piteous, disconsolate little face and grasp the broken spokes harder than ever.

Next morning, about ten o'clock, Captain Hurley came to the wheel; the binnacle was gone and I was steering by the wind. "Jim," he bellowed close to my ear, "Jim, the glass is rising and I think the storm is about blown out. I want to get the topsails onto her and see if we can't drive her out of this region. Do you think you can keep her off without broaching? I'll send another man to the wheel if you want him."

"No, captain," I shouted against the wind; "one bad man is better than two good ones on an occasion like this, and, besides, you will need all the hands you've got left on the braces. When you're ready, sir, let me know, and I'll keep her off to a dot on the chart."

Captain Hurley struggled forward against the wind and smother to give the necessary orders.

The fore upper and lower topsails were loosed, hoisted and sheeted home. Then the old man stood on the forehatch and waved his hand as a signal for me to keep her away.

Never in my life did I have such complete confidence in myself as I did that moment. I eased the ship away gradually as fast as the laboring seamen at the braces checked in the yards.

As the big ship fell off gradually be-

fore the wind. I watched the climbing seas and the men at the braces in the waist without the quiver of an eyelid.

Thruout the whole maneuver I don't think she shipped a bucketful of water.

I felt absolutely safe and fearless, and I also felt manly and proud; proud of my power and ability to do what I was doing with that broken wheel, for the safety of that ship and all within her were delivered into my hands that day.

At last, the yards were squared, the two big topsails puffed out their cheeks and the "Restitution" blew away before the wind like a startled albatross.

About an hour later the storm subsided, almost as suddenly as it had arisen. Then the lashings were taken from my waist and I was relieved.

Stiff and sore and hungry I was, but not fatigued; I even think I could have managed another hurricane had there been one handy.

The working of the ship in that storm crushed nearly every case of oil in her hold, and, when we got to Japan, the most of her cargo had to be discharged from the hulk thru the bilge pumps, like so much sea water.

When I got relieved from the wheel that morning, Captain Hurley came and laid his hand on my shoulder, and speaking as kindly as tho I had been his only son, he said: "Jim, you'd better go below and have a rest; I know you need it."

"Thank you, sir," I said, as I started forward, "I think a nap would do me good."

But the old man grasped my arm, and turned me aft again.

"Come down here, Jim," he said, and he led me to the after companionway.

I descended, with Captain Hurley, into the cabin. The floor had been flooded with water, which had now drained out the scuppers, but the carpets were wet and sodden.

Captain Hurley tapped the spirits cask and handed me the best noggin of brandy I ever drank. Then he brought out cabin biscuit and a tin of preserved meat and gave me food, for it had been impossible to cook anything for two days. When my hunger had been satisfied he told me to lie down and sleep. I sprawled out of my dripping oilskins and turned in on the big couch in the after cabin.

Mrs. Hurley brought a pillow and a quilt from her stateroom and tucked me away, just like mother used to do. Then I thanked her and went to sleep, unmindful of the storm. I slept like a handspike till eight bells in the afternoon, oblivious to all creation. When I turned out and went on deck the storm had abated; the sea had subsided, the ship was under all the canvas it was possible to set, and driving away to the east-north-east for the Straits of Sunda before a moderate gale.

We rigged up the flywheel pumps and pumped her out, to the stirring strains of that ironical old pumping chanty, "Fire Down Below," where there's nothing but water to light it with, and good briny sea water at that.

The night after the hurricane we raised the white light on Aujer Point, the northern extremity of Java, and then came the inevitable long calm, about the longest and smoothest one I ever encountered.

Sometimes a calm will wreck a ship quicker than a storm, for she will lay and roll herself to pieces when she has no wind to steady her.

But that calm was absolutely smooth and quiet. It seemed as though the hurricane had carried all the wind out of the Indian Ocean, and the sea was perfectly still and aggravatingly limpid.

So, for fourteen days we lay and drifted between an azure sky and a glassy sea, surrounded by an atmosphere of intangible ether.

Every night we saw the first gleam from the tower of the white lighthouse, and every dawn we saw it extinguished.

One tide would drift us in toward the Straits, and the next would drift us back again.

Around us floated hundreds of immense island trees, which had been torn up, root and branch, and sent adrift by the irresistible power of that fearful hurricane.

Eventually a fair wind sprung up from west-sou'-west, and wafted us in thru the Straits. And so, with the smoking volcano, rising sheer from the depths looming up on our larboard hand, Java

Island to starboard, Sumatra away to leeward, and Borneo clothed with verdant, waving trees just visible in the dismal distance, we dropped our mudhook abreast the tall lighthouse at Aujer Point.

Next day, one of our old sailing chums, the aforementioned American ship, towed past us completely dismantled, and proceeded up the bay to Batavia for repairs. They had saved their monkey gaff and lashed it to the stump of their broken mizzen mast for a signal-pole.

They spoke us as they passed and reported that they had lost four men and the skipper. The German bark was never heard from again.

We made such temporary repairs as we could at Aujer, and proceeded on our way across the China Sea, without any bulwarks, without fore-to'-gallant mast or jibboom, and our wheel lashed up with oaken billets in place of spokes.

We reached Hiogo on the 19th of June, and remained there three months and two days.

There were thirteen sailing ships and seven men-of-war in the port, a sight that will never be seen there again. Among the war fleet was the old American frigate "Omaha," at that time flagship of the Asiatic Squadron; the wooden corvette, "Alliance," and the old composite gunboat, "Palos," the first warship that ever passed thru the Suez Canal, in 1869.

She died on the Asiatic Station and never returned to her home port.

Among the foreign warships were the French composite frigate, "Triomphante," an old tub with a fake ram and a bow-chaser under her martingale. She was accompanied by her consort, the corvette, "Chasseur," manned, principally, by Martinique negroes.

There was also the German gunboat "Wolfe," and an English fighting ship, the name of which I somehow forget.

All our raniks were driven over the side and paid off, with the jib down-haul, during our stay at Hiogo, and we sailed away from that interesting port late in September, with a full crew of Japs, with the exception of myself and three others, who served as quartermasters on the passage home. Owing to the lateness of the season, it was decided to take the Cape Horn passage on our return.

So we completed the circumnavigation of the globe on that voyage. We reached New York on the 20th of March, 1891, 176 days out from Japan; six months all but two days, just fourteen months and fifteen days from the date I joined the ship. It was the biggest pay day I ever had, $257.

We were obliged to lay in the lower harbor and strike our to'gallant masts to pass under Brooklyn Bridge, then we docked at Pier 19, East River, and went to the British Consul to be discharged.

That is the end of the voyage and the Easter hurricane.

When we were lined up at the shipping office, and Her Majesty's Consul was about to hand me my written discharge, Captain Hurley took it from his hand, and dipping a pen into red ink he dashed across the face of the document these words: "Helm Excellent, John W. Hurley."

That was the very highest recommendation which the law permitted any shipmaster to bestow upon a merchant seaman, and I could not have felt prouder of that discharge if it had made me the ruler of a nation.

A couple of voyages later, when I returned from Calcutta in the "Record," I was told that Captain Hurley had committed suicide by poison in Australia.

He was certainly a notorious villain and a most inhuman brute.

He treated his crew like dogs and his wife like a slave. She left him at Kobe and paid her fare home by the way of San Francisco. His sailors left him everywhere they got a chance.

But in spite of his calloused, insane, almost inhuman nature, I could not help feeling grieved over the news of his death, for he appreciated a sailor's work when he saw it done, and treated me as an equal when I did it, and, therefore, I shall always respect his memory.

New York City.

The Women's Movement in Germany

BY HELENE STÖCKER, Ph.D.

[Dr. Helene Stöcker, of Berlin, is today one of the foremost figures in the Women's Movement in Germany. She occupies a prominent position as a lecturer and writer on philosophical and ethical matters pertaining principally to the women's question. One of her best known works is entitled "Love and Women," in which the problems of love and marriage, friendship and parentage are treated from her standpoint of heroic optimism. Fräu Stöcker is also a professor at the Lessing Hochschule, Berlin, and president of the Society called "Mutterschutz," which was organized about two years ago for the purpose of protecting the rights and furthering the interests and welfare of wives and mothers.—EDITOR.]

IN Germany it is doubtless due to the individualistic view of life taken by Goethe, and to romanticism, that the women's movement owes its origin and development and its consequent constraint of domestic relationships. To believe that it is the outcome of cleverly arranged agitation is merely to betray a certain naïve ignorance of historical and psychological events and conditions which have brought the women's movement into existence. Were it not for the revolutionary changes brought about by the invention and introduction of machinery, etc., we would have stayed practically where we were at the beginning of the nineteenth century. That is to say, the more refined and intellectual women would have rejoiced quietly in the excellence of their own gifts, without a thought of making this excellence attainable for the other members of their sex. Even if women had had a fully satisfactory activity—satisfactory in the sense of its being productive as regards their household work, the changed conditions of industry would still have abolished it. From a productive activity, a more administrative activity developed. And the possibility of giving occupation to the numerous feminine element in the household was therefore lost. New kinds of work had to be created to take the place of those that were lost. The old saying that "A woman's place is at home" had its application only so long as the woman could do everything which belonged to the home. When the advancement of machinery took that out of her hands there was nothing to do but to seek employment outside of the home, without which employment every person degenerates physically and mentally.

In this way the women's movement became a necessity. Two ways only were open for a woman to whom the opportunity for work was denied, providing she was not fortunate enough to have come into the world blessed with a yearly income. These were *disgrace* or *death*. Even those who could have no conception themselves of what *mental* hunger was, had to realize that woman was acquainted, at all events, with *physical* hunger, and therefore she should be allowed to provide for her physical needs with the work of her own hands. Even if there had been no women's movement, it would have been necessary for the leaders of the State to have originated it—unless they had had the intention to pension off all the women and maintain them at the public's expense.

The two roots of the women's movement, the material and the ideal, are so closely allied that it was not possible to do away with the *material* need without at once conceiving the *ideal*. The first German women's association in behalf of the movement was founded in the year 1865, two years after Lasalle had founded, in Leipsic, the first German workmen's association. For the first few years the associations were very modest in their claims for the higher education of women, perhaps in the hope of gaining more sympathy by their modesty. But about the year 1890 they began to change their policy. The idea had risen among a certain number that, in women's movements, as in politics, the saying of Bismarck applied: "Dutiful children get nothing!" In this way a more radical tendency was created which we have doubtless to thank for the more energetic

progress which the last ten years show.

In the year 1894 the various German women's organizations were brought together for the first time as the "Bund deutscher Frauenvereine" (League of German Women's Associations). This league originated from the stimulation which German women received at the International Congress at Chicago in 1893. An international women's league has been in existence since 1888; it includes several millions of women, and it held an international women's congress in Berlin two years ago. But the *first* international women's congress which was held in Berlin was in 1896, and it marks an epoch in the German women's movement. By it we gained the press to our side and in this way procured a powerful ally, for till that time the press had for the most part maintained absolute silence. There are several organs now in support of the movement, for example, *Die Frauenbewegung*, the Radical organ, edited by Frau Minna Cauer; *Die Frau*, the organ of the Moderates, edited by Helene Lange; the *Centralblatt des Bundes deutscher Frauenvereine*, edited by Frau Marie Stritt; and *Mutterschutz*, a magazine for the reform of sexual ethics, of which I am the editor. But however necessary and instructive these various organs may be, it is of greater importance, perhaps, for publicity that the representatives of the leading daily newspapers have so much understanding for our demands, and thereby are able to awaken the interest of their readers.

But the international congress of 1896 gave us in Germany much more than this: For the first time we were enabled to enjoy the most intimate association with the best women of all civilized lands, and to realize that the further development of woman is a necessary and ever increasing factor of our civilization, in the growth of which men have as much an interest as women.

No small amount of praise for the success of the movement is due to the energetic propaganda made by the so-called radical women, under the leadership of Frau Minna Cauer, Dr. Anita Augspurg, Maria Lischnewska, Lida Gustava Heymann and others. The more energetically the women advanced and fought, the more obvious became their division into various groups. Even at the time of the League's foundation in 1894 the working women's associations were debarred from it, on account of the still ruling moderation, for they were looked upon as political associations, and in Germany women may not legally organize political associations. In consequence, the so-called proletarian movement of the Social

HELENE STOCKER, PH. D.

Democratic women strove with great energy to have no connection with the middle class women's movement. The Social Democrats were even until lately of the opinion that a *women's* movement was foolish and impossible at the side of the workmen's movement, and that it could be left for the middle and higher classes of women to support.

Frau Lily Braun, who is herself of the middle class of women, and is now one of the leaders of the Social Democrats, has for some years held the opinion that a movement especially for women, in this connection, is an "evil." But, in the meantime, the necessity for a union of women to represent their separate interests has been recognized, and the much maligned women's organization has been undertaken. And as the Social Democratic women are in the very gratifying position of having a few million followers, it is to be expected that in ten or twenty years their movement will surpass the middle class Liberals in number and power, just as at the present day the Social Democratic party surpasses the few really Liberal men. Among the Clerical-Conservatives it has also been recognized that it is now time to take up a position in the women's movement, unless they want to drive the women into the camps of the Progressive parties. In this way two religious women's leagues have come into existence. The first is the Evangelical Women's League, under the leadership of Paula Mueller, who is as energetic as she is fanatical. In her organization all women are invited who do not wish to take part in the women's movement without giving expression to their religious convictions. The other is the Catholic Women's League, under the direction of the Center party. The fact that the Center is now taking the women's movement officially under its wing is the best argument that this movement is being considered seriously and that it can no longer be ignored. And among the masses that stand behind the Center the growth of a Catholic women's movement is to be observed, tho we must count on a slower growth here than among the proletarians.

Between these two extremes to the right and the left lie the numerous parties with varying shades of difference which are all joined in the "Bund deutscher Frauenvereine." These loosely-connected associations could, however, only resolve upon such matters as every one could heartily give consent to, and therefore they were in no way capable of advancing the women's movement, as Helene Lange, the leader of the Moderates, characteristically declared some years ago. Meanwhile, however, an organization has sprung up which has become more and more conscious of the difficulties of its task. Indeed, the differences of view are so great in it that at the league meeting held in Nuremburg a few weeks ago one might have thought it was a fight between Agrarians and Liberals. Naturally this development must progress continually, corresponding to the party changes of the political men. At the present moment the forces of the "moderate" partisans of women's rights and of the "liberal-radicals" almost counterbalance each other; on some questions the right had the majority and in others the left, at the Nuremburg meeting. This points to a tremendous progress of radical thought among middle-class women, which, in a few years, must lead to a complete victory, or to a division between the two principal groups of middle-class women, of which the first might almost be counted among the free conservative and national liberal politicians, while the second represents the "liberal union," or the standpoint of the real Liberals.

The division of the women's movement according to the religious and political standpoints just mentioned proves sufficiently that the women's question is therefore not the same for the different classes of women, and requires a different solution for each. The Social Democratic women are wrong in their assertion that only the success of the Social Democracy will guarantee the success of the women's movement. There are enough men among the Social Democratic party, as among all other political parties, for whom the women's problem is a book with seven seals; while, on the other hand, there are members of all parties who have already realized the significance of this struggle.

If the ultimate aims of the women's movement are not yet quite clear to every one, namely, the complete civil and

political equality of women with men, the possibility of having a home and children and a profession corresponding to their individuality is so evident a need for women that even the most backward cannot deny the necessity of forming new possibilities of industry with regard to domestic relationships. Consequently the greatest amount of success has been attained in the fields of education and training and the preparation for various professions. Thus far the question of education and the preparation for certain questions has been of most importance in the women's movement, and, I think, rightly. Only those who are sufficiently trained for the domestic and mental struggle can hope to win.

In the last few years in all the larger towns of Germany gymnasium or real-gymnasium "courses" for girls have been opened. In South Germany, however, they hit upon the much happier plan of allowing girls to enter the higher institutions for boys, if they wish to obtain a higher education. The education in mixed schools, which has long been a feature in American and Scandinavian schools, certainly paves the way for a more friendly and natural intercourse between the sexes, from the very beginning. If the women's movement aims at bringing the sexes nearer together, its most powerful means will be the education in mixed schools, which will doubtless be the form of education of the future.

The opening of German universities to women which has taken place in the last ten years has not yet led to official matriculation of women in all the universities. However, the refusal to allow matriculation is a simple formality, for the semesters are reckoned for the women students of medicine, and they are permitted to enter for the State medical examinations. At the present time we have already quite a number of qualified women doctors in Germany. Even a small number of women have been trained for legal professions; unfortunately the field is not yet open to women to practice as barristers. As a recompense for the lack of advocates a large organization for female legal protection has been formed among the women legal experts whereby poor women can receive legal advice and help in matters of jurisprudence.

In the last decade here in Germany women have also been trained for head teachers, and a short time ago they received permission to enter the State examinations for head teachers, which had hitherto been reserved for men alone. The profession of preaching has not as yet been opened for women in Germany, as it has in England and America, altho the Rev. Anna Shaw, at the last international congress, proved to the most stubborn opponent that even a woman can be a born preacher.

But not only in the sphere of education and charitable works have the women in Germany made the most progress in the last ten years. The understanding of the need for women's suffrage has grown in an astounding manner. The German League for Women's Suffrage was founded only about five years ago by Dr. Anita Augspurg and others. At the international congress for women's suffrage held in Copenhagen last August they were able to announce the formation of quite a number of separate associations. And not among women alone, but among men also, has the idea gained ground, and the political parties have been obliged to take up a position in regard to it. In addition to the Social Democrats and the members of the Liberal Union, a few representatives of the Center have declared themselves in favor of women's suffrage.

The latest phase in the German women's movement, however, is in the direction of motherhood protection. At the head of this movement stand men and women of all scientific and political opinions; famous lawyers, such as Professor von Liszt; well-known authorities on sex science, such as Professor Forel, Dr. Havelock Ellis, Dr. Albert Moll and Dr. Ivan Bloch; the socialist Lily Braun, Maria Lischnewska and others. The president and the writer of this article edits the official organ of this movement, *Mutterschutz, Zeitschrift zur Reform der sexuellen Ethik* (published by J. B. Sauerländer, Frankfort a-M.), a magazine which deals with the problems of love and marriage, friendship and parentage, and all the questions of sex

morals, viewed from a philosophical, historical, legal, medical, social and ethical standpoint. A number of prominent personages have taken up the practical work of the league, by direct help to mothers and children, and thru the medium of the magazine have greatly influenced public opinion of the necessity and importance of the movement. In a recent article in the *Fortnightly Review*, entitled "The Awakening of Women in Germany," Dr. Havelock Ellis called attention to this question. Among other things, Dr. Ellis calls attention to the fact that this movement is not the demand for political rights, but the right of feeling, and a judicious arranging of all those social functions which are founded on this feeling. In any case, the basis of this movement is the desire of woman for motherhood. Its object is to insure her this right and to regulate the personal and social relationships which spring from this function. It differs characteristically from every other women's movement, inasmuch as every other is based on what woman has in common with man, while it is here a question of that in which woman differs from man.

The motherhood movement intends not only to give women the right of motherhood, but also to protect women as mothers. For altho motherhood has been idealized in art and poetry, in real life it has remained an empty word. Yes, there are innumerable cases where the mother stands without rights and without protection. Again, at the present day, the parental power of the mother over her children is extremely limited as compared with the husband, notwithstanding that it has been demanded of women thus far that they should make the training of their children their sole aim in life. As for the unfortunate woman who has given birth to an illegitimate child, and has been deserted by the child's father, every one knows the disgrace which is her lot, and with what contempt she is looked upon. It is the object of the motherhood movement to call attention continually to the horror and repulsiveness of these conditions. We know that all human beings have developed under certain fixed conditions, and must further develop. So we do not need to clasp our hands helplessly, but should use them for the purpose of altering untenable existing conditions. Our whole social development, which demands for women of all positions a greater pecuniary independence and fitness for professional life, is, in other respects too, advancing in the direction of better conditions.

What still remains to be done by the movement for the protection of mothers is to institute inquiry offices for situations, for legal protection, medical help, etc. Besides this, it is necessary that the work should be recognized by every one. This must be not merely by women receiving fit recompense for their work, but also by increasing the assurance of their protection. For it is not only the unmarried mother for whom motherhood is a physical, moral and social martyrdom. As the statistics of all countries show, even married men, who are perhaps the fathers of several children, refuse the claims of fatherhood. They leave wife and children, and these fall into dire misfortune, and have to be cared for by public charity. Marriage protection, of which we hear so much, is therefore often lacking, and, as for the legal protection of unmarried mothers, it is out of the question, and, in fact, is nothing more than an empty form. There are only 16 per cent. of the unmarried men who can be persuaded to perform their very modest duty of providing for their illegitimate children. We must continue to strive for a recognition of the fact that the bringing up of children is a social duty, of which the burden must be borne by all. If we can attain that by the formation of a motherhood annuity, or, better still, a childhood annuity, we shall be able to protect the marriage bond in critical cases much more securely than by the most rigorous marriage laws which see a merit in making divorce impossible. When we have succeeded in rendering mothers and children no longer so helpless, when we consider the motherhood of women, with all its consequences, as a social work, we shall have taken one of the most significant steps toward the solution of the women's question, and which leads from barbarity to culture. And it seems sometimes as if we were not very far distant from this object.

BERLIN, GERMANY.

The New Farmers' Movement

BY JAMES A. EVERITT

[Mr. Everitt is one of the founders of the American Society of Equity, and is now its president. Since the first annual meeting, in November, 1903, the society has so extended its membership that, as the article states, it exists in no less than twenty-eight different States, while it has a membership of over 500,000, having an alliance with the American Federation of Labor. We comment on this article elsewhere.—EDITOR.]

The American Society of Equity is the title we have chosen for an association of American farmers and friends of the American farmer, because it is a very appropriate title, considering the purposes of our organization. If you study the meaning of the word "equity" as given by the dictionary you will find it explained as that which is equally fair or just to all concerned—in other words, justice to all; consequently the American Society of Equity is a name as well suited to those who till the soil as to a body of merchants, bankers, lawyers—perhaps is more suited to us when we remember the position the farmer occupies as a wealth-producer and as a citizen of the United States.

The American Society of Equity is a young organization in point of time, but such is the interest now manifested in it that our members can be counted all the way from the Atlantic to the Pacific Coast. In fact, we have members in 2,700 out of 3,000 counties of the United States, and in 35,000 post office neighborhoods out of a total of 68,000. We now have 4 department unions, 13 State unions, and neighborhood and county unions in 28 States. To show that other classes of citizens recognize the value of our policy, I may add that our last annual meeting was attended not only by farmers, but by men high in the councils of organized labor, tradesmen, professional men. One of the speakers was a man who is eminent as a priest in the Roman Catholic Church. All such are welcome, as the society is not intended for the farmers alone, altho its membership is principally composed of them. It recognizes any one who is a friend of the agriculturist, and I may say here that we are in thoro accord with the great army of union labor, since the objects for which it is working are so similar in many respects to ours. It is a happy coincidence that the association originated in that great center of labor—the city of Indianapolis, the home of John Mitchell — which is also the market for one of America's greatest agricultural communities.

JAMES A. EVERITT.

Already organized labor has recognized the benefits of co-operation with this society, and at the national meeting of the American Federation of Labor in 1906, a working agreement was made with it. President Gompers, in referring to the possibilities, voiced the sentiment of the large gathering when he said: "The very presence of these representa-

lives of the farmers of our country bodes the greatest good for all our people. May it be the harbinger of a greater swiftness of the movement for the protecting and uplifting of our common people."

To attempt fully to describe the policy of our organization would be impossible in an article of this character, but I can briefly refer to some of its principal objects and plans of work which may give the reader a conception not merely of its importance, but of its necessity to the class of Americans it represents.

The chief object of the society *is to secure profitable prices for all the products of the farm, garden and orchard.* This is chief and paramount, for if farmers cannot gain the first object they cannot gain any of the others, and their products will always be used to enrich the small class who try to control the result of their labors. The founders of the society chose the word "equity" because they realized the tremendous power that would be in the hands of the farmers organized and in possession of all the food and other supplies on which the comforts and very life of human beings and domestic animals depend, and desired that there should always be the motto before them to do equity, while they are demanding equity.

In the organization of the American Society of Equity are local unions, county unions, State unions, and a national union. These are the component parts of the society as relates to its development and maintenance and are supported by small membership fees and dues. But included are district unions, section unions, and department unions. A department union is organized for each important crop or class of crops. There is a fruit and produce department, a tobacco growers' department, etc. A district union is a part of a department union, as the district union of Burley tobacco growers. The New York City district of the Department of Dairymen is another illustration. A section union comprises a group of States and is the active organization in receiving reports of supply and demand and in directing the supply to meet the demand. The department, district and section unions are maintained from a small sum, merely the fraction of a cent, added to the price of each crop above the minimum price agreed upon. The farmers transfer the expense of marketing their crops to the buyers, who pay for it just as the farmers have always helped to pay the marketing expenses for other people's goods that they bought.

In operating the society never buys any crops. It acts only in a directing capacity. The section unions get reports of all the crops ready for market any day, also the daily demand, and then they properly distribute the supply in proportion to the demand. For example, a member will report what he will have to sell next day, or may report a few days in advance, to his local union. The local unions in a county will report to the county union, also informing it as to the transportation routes. Thus the county union will have a report of all the marketable grain, live stock, vegetables, fruit and other staples. It reports a summary of the supply to the section union, which in turn reports to the national union. The national union will then have a report from all over the country of the supply ready for general distribution—not the part that the producer intends to sell in the local market. On the other hand members will get a report of the demand from the society representatives in the principal markets. Thus we expect to regulate the law of supply and demand. We will try to hold the products in the sections where they are produced until the demand for them enables them to be sold at a fair price to the farmer. The national society has no capital, and is simply a controlling power to direct the movements of the different local societies. We are not a trust or combine, and the capital is held by the stock companies which are formed at the various shipping points.

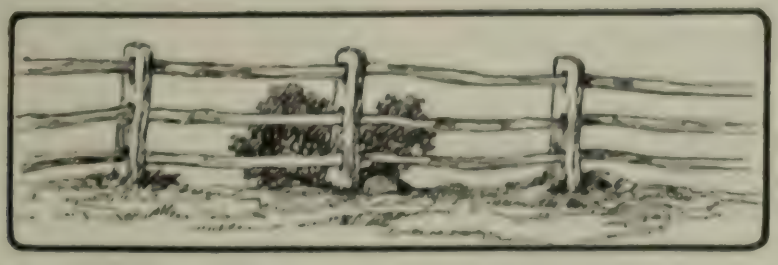
We expect to provide granaries, warehouses, cribs, elevators, hay barns and cold storage houses for the use of the farmers in storing their products if the market is below our minimum price. To illustrate this, suppose a farmer has his products ready for the market and cannot afford to hold them and needs the money. He can haul them to the shipping point and store in the society's warehouse. He will be given a shipper's receipt, and can take that receipt to the

bank controlled by the society and draw two-thirds of the marketable price of these products. When the market goes up to the agreed price, his products will then be sold and he will receive the balance of his money.

We also expect to establish a system of price bulletins by which the members will be told each day what is the market price made by the society and not by "bulls" and "bears" on the boards of trade for products, and what market it is best to ship to. In this way we can prevent any certain market being overloaded.

The American Society of Equity means to make steady, uniform and profitable prices for farm products; to prevent speculation in farm products; to enlarge markets at home and abroad; to establish elevators, warehouses, cold storage houses, etc., belonging to or controlled by the producers; to remove unnecessary agents between producers and consumers; to prevent adulteration of food; to induce boys to stay on the farm; to increase farm values; to protect farmers from the products of cheap labor in foreign countries and our island possessions; to establish parcel posts, postal currency and savings banks; to promote honest insurance and safe banking.

These are among the things we think should be obtained, but we are not unmindful of our fellow toilers. The American Society of Equity recognizes the right of labor to organize for its right and welfare, and that such organization has lifted up and dignified labor, guaranteed the excellence of its product, saved the working man from serfdom, secured him a fair proportion of wages for work done, lessened the hours of his toil, saved his children from unduly early toil and saved posterity thereby from becoming a race of degenerates.



Believing these assertions to be true, then should organized consumers in any of the labor organizations decide to cultivate friendly and trade relations with the producing classes—farmers—and for this purpose decide to establish agencies, exchanges, etc., or other means of directly meeting the producing classes and receiving their products at first hands, the American Society of Equity will be more than willing to co-operate to the end that consumers may secure the necessities of life at equitable prices.

It is the belief of the society that all laws or regulations compelling the sending out of the monthly reports of growing crops should be repealed or modified to the extent that any and all crops should be reported only at the time of maturity of such crops.

It is also believed that the system inaugurated in many States, either by enactments of their legislatures or by the regulations of the agricultural departments of such States, compelling farmers to list the acreage of growing crops, is manifestly unfair and unjust to the producers, in that it furnishes weapons to the brokers, speculators and distributors to break down and destroy the equitable prices of such crops even before they are harvested, and that all laws, enactments or regulations of this kind should be repealed or modified.

While the society is not in any sense a political party, with the millions of farmers organized, and a multitude of their friends in the society all demanding equity, I expect it will make its power felt in laws and government thru whatever party may be in power.

INDIANAPOLIS, IND.

Simplified Spelling in French and English

BY LOUIS HAVET

[The author of the following article is one of the distinguished scholars of France. He is a member of the Academy of Inscriptions and Belles-Lettres of the Institute of France, and professor of Latin Philology in the great post-graduate school of the Paris University, the College of France. Professor Havet has always been one of the most active members of the French Spelling Reform Commission appointed some years ago by the Minister of Public Instruction, and his learned report on the subject has met with much the same opposition in France as has been experienced by the American reformers in the United States. —EDITOR.]

WHEN a French child learns English, he finds it absurd that *wrong* begins differently from *right*, and that *enough* is not pronounced like *plough*. If I am not mistaken, when a child in London or New York learns French, he also thinks it odd that we write *boeuf* differently from *neuf*, and that we pronounce *mille* differently from *fille*. These children are perfectly right to be surprised at this queer fashion of spelling and pronouncing. The instinct which gives rise to this dissatisfaction is a just instinct; for, the alphabet itself being phonetic, it ought to be used in such a way as to render sounds perfectly.

Furthermore, these children are right not only in theory, but what their common sense demands is perfectly practicable. It would not only be a good thing, but it is a possible thing, to better the spelling of words in all languages. The Frenchman of today writes *fantôme* and not *phantosme*, as did his ancestors. The American prints *honor* instead of *honour*, and begins to substitute for the perfectly astounding forms *though* and *through*, *tho* and *thru*. Every one of these changes stands for a victory of clearness over blindness; and these are victories whose effects will last. If a child is accustomed from the start to write *fantôme* or *thru*, is there any likelihood that at forty he will go back to *through* and *phantosme?* It appears absurd even to ask the question. It is a proved fact, therefore, that we may go from complicated to simplified spelling, but the inverse cannot be done. And this is an important fact.

The more complicated and absurd the orthography of a language is, the more useful will be its simplification; but, unfortunately, at the same time, it is these languages that it is the most difficult to reform. The two worst systems of spelling in the civilized world are, without question, those of the French and English languages. Consequently, it is the duty of the French, on the one hand, and the English and Americans, on the other—and I count more in this matter on the Americans, who are not afraid of new things, than on the more old-fashioned English—to make the chief effort looking toward a general simplification of spelling thruout the world. But nowhere else will the reformers meet with such difficulties and nowhere else will the victory, once won, carry with it so much good.

The essential element of spelling reform is simplification. In every language and in every country, it means the suppression of what is not pronounced, and the writing in the same way sounds that are pronounced in the same way. Everywhere, it tends to diminish the number

of rules and to lighten the dry part of school work. In the old as in the new world, the reform will be made in the interest of the living as against the thoughtless tyranny of the dead, in the interest of children and in opposition to the stolid routine of adults, for the multitude in spite of the pedantry of a false élite. This reform concerns whole nations, individuals, the human race in general. Let us touch on these three categories.

It is to the best interests of a nation

LOUIS HAVET.

that its language be rapidly accessible to all its citizens. It is very necessary that a little Breton or Fleming learn French easily; that a child in the Highlands or a young Welshman master English without too much difficulty. This easy acquisition of a language is especially important in countries which are open to immigration, like French Algeria and the Western United States. Every foolish subtilty postpones the moment when the new citizen will be no longer distinguishable from his fellow men, and so checks in a serious way the perfect unity of a nation.

The individual suffers in his personal development by a bad system of spelling. The child of French or English speech is far from knowing how to read when he has mastered the fundamental mechanism of the alphabet table: b, a, ba; e, n, en; g, o, t, got, etc. This is something; but this same unfortunate child still has but a ridiculously small number of words at his command—words that he can read. He can make out *ten cats,* but not *eight calves; hat,* but not *shoe; red,* but not *blue; America,* but not *United States.* How much better off is the child who has as his maternal language Italian or Spanish? If he knows the alphabet and its simple combinations, he is immediately able to read any text suited to his years. While the other child, aided by grown persons, consumes whole months in making the acquaintance of odd combinations of letters, the Spanish or Italian child, without any assistance or waste of time and patience, himself quite alone, discovers the written thought in the book before him.

Humanity also, the universal democracy of the future, will be benefited by a reasonable reform of the orthographies of the different nations. In fact, nothing is more aristocratic, in the bad sense of the word, than a vicious system of spelling, whose difficulties are sometimes unsurmountable to children born in the lower strata. "You are quite right," a Paris cabman said to me in 1889, when I was making an active effort to simplify French orthography; "for it is so hard for us to read the newspapers." The fact is that the daily paper and books also are shut against thousands of persons of both sexes and of all countries, because, in their childhood, they were discouraged by the artificial difficulties which surrounded the task of learning to read. Their monotonous days are now passed in ignorance of what other beings, more fortunate than they, are enjoying, and they die unconcerned about the greatest misfortune of their life. Democracy should feel remorse when it thinks of these intellectual pariahs; that is, if democracy is to be governed by a brotherly sentiment. And humanity, even if it were aristocratic, should recollect what is expected of it from the very etymology of the word.

Modern society the world over is very proud of the way in which it educates its children. It takes great praise to itself for having built fine schoolhouses, for the good teachers put at their head, for the excellent text-books furnished free and without stint. But this same society seems to take less interest in the way in which study is conducted in these schools and yet here, too, might be found a subject of self-congratulation. A slight reform in orthography would be an act that we might well be proud of, for it would make school life more congenial to many a poor pupil, would render his work more fruitful and would be a blessing for society in many ways. In America, President Roosevelt has looked at the matter in this light, and so have our French Ministers of Public Instruction, who appointed an official commission for the reform of our orthography; and this is the point of view from which the question should be regarded on both sides of the Atlantic by all Americans and Frenchmen, by all citizens capable of examining seriously a serious question.

PARIS, FRANCE.

To My Black Mammy

BY ETHEL AMANTHIS MORRISON LACKEY

To my old Southern mammy, with kind, ebon face,
And her air of but living by means of God's grace,
Do I drink
As I think
Of her love for my race;

How her bosom so ample, in kerchief of white,
Was ever a haven from grief or from fright;
And how we
At her knee
Said our prayers every night.

Self-respecting, she naught but respect would allow:
To her dignified mien the most pompous must bow;
While calm
Like a balm
Anointed her brow.

Her care of her "mistis" with suasion and wile,
Her croons o'er the cradle of each "baby chile,"
Are all parts
Of our hearts,
Tho she's dead this long while.

Ah, mammy, I think, truly what's in a name,
For "mother" and "mammy" meant almost the same
In those days
Of whose ways
Nothing's left but the fame!

In today's bitter cup of race hatred and strife,
Of turmoil and curses—of war to the knife—
Let me pore
The sweet lore
Of my old mammy's life.

RIDGETOP, TENN.

A People's Lobbyist

BY JOSEPH LEE

[Few men have more effectively devoted themselves to civic interests than has Mr. Joseph Lee, of Boston, whose Town Room on the summit of Beacon Hill has attained a national reputation. How and why he devotes both time and money to the betterment of people and conditions; what he has accomplished and what he hopes to accomplish, he has told at the request of THE INDEPENDENT in the following article.—EDITOR.]

MY principal interest and activity in social work has been as a people's lobbyist. Besides appearing before committees and talking with many individual members of the Legislature and explaining to them the merits of different bills in which I have been interested, I have had a hand in the organizing of the Massachusetts Civic League, the object of which is to achieve team play in work of this kind. The League has originated and supported many bills that have become law, and has, indeed, for the last dozen years, been almost uniformly successful. Our function is not so much to form public opinion as to give effect to it. We serve as a lens to bring public opinion to a focus, or as a sort of social precipitant for the public purpose already existing in solution.

The common way of treating a Legislature is to leave it so far as possible in ignorance of public opinion until after it has acted, and then blame it very severely for not having done the right thing. Our idea is that it is better to say what you want beforehand than to say what you didn't want afterwards.

There is more nonsense talked about the corruption and lack of spirit in our Legislatures than on any other subject. The lack is far more in the people than it is in the Legislatures.

In my experience as a lobbyist, I have practically always had a respectful hearing, and such opposition as I have encountered has in the majority of cases been the result of honest conviction. I think the Legislature is becoming increasingly interested in the progressive social work.

The hitch in the past has been that we have passed resolutions and depended on the Legislatures to do the rest. Surely if it is worth while to send a special counsel to a State capital for the purpose of furthering a law to provide that a sidewalk assessment shall be five dollars or ten dollars less, it should be worth while to send a man to talk to the legislators and explain a possible plan to save the lives and souls of children.

If civic movements have lost their force in the past I feel it is simply because means were not taken to make the situation plain and to put in solid work of the word-saving variety for what is desired.

A thing that is not generally understood of the Legislatures is that their functions are largely judicial. They do not, as a rule, originate legislation.

A Legislature is to a great extent a court, and hears only what is brought before it; so that the people's cause will not get heard unless somebody acts as counsel for the people and makes it his business to represent them.

The Massachusetts Civic League attempts to serve that function in this

State, and I believe there should be a similar organization in every State.

The policy represented in the bills that we have gone in for may be described as the policy of watering the plant rather than tying on the flowers. We think it is better to attack an evil at its source than to attempt to deal with it after it has occurred.

As a result of the work of the Massachusetts Civic League I am proud to state that we now have on the law-books of this State a measure providing for medical examinations in all the public schools.

The bill provides two things:

First—that each child who looks to his teacher to be in ill-health, or shows symptoms of any particular disease, or who comes back to school after being sick without a doctor's certificate, or who comes back after an unexplained absence, shall be reported by the teacher and seen by the school physician. If the school physician sees anything the matter with him, notice must be sent to his parents, who are told that the child is sick and that they had better see about it. If it is an infectious disease the child is kept out of school until it is well.

Second—That every child in Massachusetts shall have his sight and hearing tested every year by a teacher. In this part of the bill also there is a provision which we hope will eventually have far-reaching results, namely, that every child shall also be annually tested to see whether he is suffering "from any other disability or defect tending to prevent his receiving the full benefit of his school work or requiring a modification of his school work in order to prevent injury to the child, or to secure the best educational results."

Under this provision a general examination of the child can be made, such as is now being made in the New York schools, including his heart, his lungs, his nutrition and his nervous condition and strength.

There is absolutely no provision whatever for any interference with the functions of the home. The desire is to make certain that the child shall be in proper condition to receive the most good out of the educational facilities offered, and to make him a strong and efficient man rather than a weak, nervous wreck; but the law provides only that the parent shall be told what needs to be done. It leaves it to him to do it.

My attention was first called to the need of something of this sort by the statement of a medical friend of mine that adenoids might stop almost completely the intellectual development of a child. When a little later Mr. Kidner, who has charge of child work in St. Andrew's Church in the West End of Boston, informed me that he had recently had eight adenoids cut out of children under his care, I realized that the extent of this particular evil made it a matter of important public concern. Some time last spring I felt the time was ripe for doing something systematic to correct this and other physical defects in school children. An account of the course pursued will illustrate the manner in which such a task is accomplished and may perhaps be a help to others.

At the start, I consulted the State Board of Education, the State Board of Health, and especially Dr. Durgin, chairman of the Boston Board of Health, who is the man who introduced medical inspection of schools into America. Next I drew a tentative bill, and I interested in it the Massachusetts Medical Society, the State Society of School Superintenddents and the women's clubs. Then, in accordance with the usual methods of the Massachusetts Civic League, of which I am an officer, and which adopted the bill, we interested in the matter everybody in the State who might be expected to especially know about it, writing circular letters to all the superintendents and all the chairmen of school committees. Finally we presented it to the Legislature and began our work there. It was done in a systematic fashion. We laid mines for the Legislature. The legislators could hardly walk in any place where they might naturally expect light on the question of medical inspection without setting off a mine that we had loaded.

As to the net result, when the matter came before the General Court our only disappointment was in the utter lack of opposition and our only difficulty was

in effecting a compromise between those who wanted the thing carried out by the school committees and those who wanted it done by the boards of health.

JOSEPH LEE.

We had simply met the legislators in their own way and we got most loyal support.

We are now preparing a campaign for having school nurses in Boston, as they have in New York, so as to carry further the policy of this same bill. Three nurses have already been employed by individuals and are working in the schools. Their work has conclusively demonstrated that in large cities their addition makes the system about three times as

effective. The nurse will recognize symptoms which will pass the teacher. She can treat the children for minor complaints without sending them home, and, above all, she can go to the home of the sick child and show the mother what is needed, giving the first treatment.

I would also say that this does not represent all the work of the League in the last Legislature. I have been much interested in two bills, which have become laws, regarding the treatment of juveniles in the courts, one for the treatment of delinquent children and one for the establishment of a juvenile court.

I have a few more pet ideas. One is the creation of playgrounds all over the city and all over the State. A child plays for the same reason that a kitten does or that a plant grows toward the light—because that is the law of growth. The form in which nature's law declares itself in him is in the command to play.

We complain of children's law breaking and we are very desirous of establishing a juvenile court, but the law that we have broken in failing to provide a place to play, is a more ancient and more important one. It is the absence of playgrounds that brings the boy in contact with the police.

I think it can be said that the playground movement is growing here and all over the country and that ten years will see a great development in this direction.

I also want in time to see the school buildings used more completely, and the school yards.

The awakening of the whole people to their responsibilities is quite as important as the awakening of the legislators. The Massachusetts Civic League is working along that great general line and for the furtherance of the plan I started, what I called the "Town Room" at No. 3 Joy street, Boston, where the League is located. The idea of the "Town Room" is to afford a place where people who care about Massachusetts, who are interested in the State as a—what may be called a spiritual body, an embodiment of the public will—can go and find out what the State is doing and what its different parts, the cities and towns, are doing, and what it stands for, and where they may, by good luck, receive some inspiration as to what the State ought to do and what its deeper meaning is.

This seems to me a very laudable idea on my part, but I cannot say that I have so far succeeded in carrying it out in a very effective manner. So far as the room itself is concerned, I think it is good. It was made by pulling out the floor of the top story of an old brick house so as to make a room two stories high running up to the gable. The beams and rafters have been left just as they were, and also the brick walls which form the gable ends of the room. There is a cypress wainscoting about ten feet high and a hard, pine floor, both stained dark reddish brown to harmonize with the color of the rafters and the boards of the roof.

I have there the library of the Twentieth Century Club and about three hundred more books that I have added. What I want further, and what I have not succeeded very much in getting are pictures and maps and circulars and printed matter of all kinds illustrating the social and political life of the different cities and towns. I want the Room eventually to have good pictures of all the best architecture in the State, both buildings and landscapes; of all the most home-like looking old commons or the most beautiful elm-lined streets such as one sees in the Connecticut and the Housatonic Valleys; the best school buildings and playgrounds; the best methods of celebrating the Fourth of July; the best fountains and sign posts and telegraph poles, and everything else that concerns the making of a city or town beautiful or that makes the public features of a city or town a fit and dignified expression of a strong and self-respecting public life.

BOSTON, MASS.

Literature

To Altruria Thru Anarchism

COMFORT, refinement and security for everybody! And only three to five hours' work a day! What an alluring vision! We need not debate whether Kropotkin's estimate of five hours or Howell's guess of three hours is correct; for we would be satisfied to accept five hours and would not fight against reduction to three. Should the correct figure be nearer eight than five, we would e'en be thankful, so long as the plenty, the certainty and the universal intelligence of the vision were assured. But roseate as is the dream, fain as we would that it might come true, these books do not bring conviction of its realization. Neither writer has done his best work in these sociological volumes. Kropotkin's chapters lack the charm and the scientific serenity of his Autobiography and his "Fields, Factories and Workshops"; while Mr. Howells seems to have lost, we hope only temporarily, that lambent humor which plays over most of his pages. *The Conquest of Bread*[1] is a translation of a work written some years ago, but expressing truly, tho less persuasively than some of his other essays, the philosophic anarchism of which Kropotkin is the leading living exponent. It expounds both a social plan and its justification. It sketches very broadly a revolution, which, the writer says, "rich and poor alike recognize is imminent"—a revolution characterized by flat expropriation, and a readjusted society wherein dwell plenty, freedom and brotherhood. Mr. Howells, while inspired by the same spirit as his colleague, is an artistic critic, not a scientific reasoner. Disappointed by the reception given to "A Visitor from Altruria" when he first appeared, he has continued the experiences of that charming gentleman,[2] and, since, like so many foreign visitors, the Altrurian succumbed to the fascination of the American woman, and took home one of them as his wife, his chronicler, deftly weaving the love story with social observations, presents a picture of life in Altruria in the letters of the exiled bride.

To the indictment which Mr. Howells makes of the stupidity, the unreasonableness and the injustice of life in our cities there is no reply. Our assumption that it is natural and proper for a few to eat the costly, unhealthy meals which the Altrurian shared on Thanksgiving Day, while many children are under-nourished and thinly clad; the cool impertinence with which most of us take for granted that the servant should be satisfied with dark, ill-ventilated rooms and inferior diet; the homage to hideous fashion and the servitude to bad taste which are prominent among the well-to-do people with whom Mr. Homos associated—to all those Americans who are open-minded must sorrowfully plead guilty. Likewise the superiority of life in Altruria must be admitted. There everybody works, including father, and nobody wants for bread and mushrooms (the Altrurian substitute for meat); there the servant problem has been solved by the elimination of personal service and the devil foiled by the elimination of folly. Most readers will wish that they also could book a passage on the "Little Sally" when next she sails for the bright Altrurian shores. A few unregenerates may shrink from the mushroom diet and cling to the fleshpots of Chicago; but the short obligatory workday, the jolly co-operative voluntary labors, the spacious life, the lovely festivals, the security for old age and for children—these must surely fascinate the average American, "anxious about many things," unless the fever of our life has so penetrated his soul that, like the ear deadened by the roar of elevated trains, it has become insensible to higher harmonies.

But how shall we reach Altruria here in America? To that question Mr. Howells attempts no answer beyond the suggestion that we must abandon personal service and all share the drudgery; and Kropotkin's answer lacks cogency. Neither writer reckons with the craze for luxury or for complexity of life, as

[1] THE CONQUEST OF BREAD. By Peter P. Kropotkin. New York: G. P. Putnam Sons. $1.50.

[2] THROUGH THE EYE OF THE NEEDLE. By W. D. Howells. New York: Harper Bros. $1.50.

the Darwinian would call it, which has seized all classes. If everybody were satisfied with a cup of coffee and a little fruit for breakfast (Mr. Howells won't give up his coffee, despite the terrifying street car advertisements), and with a few mushrooms and vegetables for other meals; if women were content to wear one style of dress perpetually; if the common craving for rich furniture and showy drawing-rooms, for fast horses and automobiles, for trips to Europe and for costly toys for the youngsters could all be eradicated, then, perchance, three hours' labor a day could supply our wants. But almost all workmen would rather work long hours for high wages than short hours for low wages. While wages have doubled and trebled in a century hours have been reduced but little. Business men prefer even to sacrifice their health if only a fortune accrues rather than simplify their lives and increase their leisure. Few, painfully few philosophers, are left to "cultivate plain living and high thinking."

If everybody is to enjoy a complex, rich life, as Kropotkin premises, only by the perfection of invention and of organization can all be supplied on five hours' work a day. Surely the result would not be attained by the abandonment of organization, which the philosophic anarchist recommends. His account of the passage from Capitalism to Communism is full of gaps of logic. He says:

"The proletariat will rise, declare all property free to all, and then, having arranged themselves spontaneously in groups, they will adopt ideal methods of cultivation and manufacture, allow to everybody access to all goods 'according to his needs,' and, without laws or governments, live together a harmonious and progressive life."

The writer proves that, by the use of glass houses, of soil specially made, manured, heated and tended, and with abundant capital and skill, a tiny area can be made miraculously prolific; hence, he argues, a city in revolt, such as Paris, will immediately feed its millions from hot-houses they will at once establish. Mobs in arms, in Kropotkin's imagination, will show an intelligence and a power of self-government of which no sign is visible in the existing society; by the attraction of the revolution they will be arranged in beautiful order as a heap of iron filings is arranged around the poles of a magnet. Whence the hot-houses will descend and what the crowd will eat while the first crop is growing, who will direct the labor and by what force each man will be kept at his job, and how the plant food necessary for intensive cultivation is to be supplied, no indication is given. From the unphilosophic anarchy of capitalism to the philosophic anarchy of imagination there is one bound; the intervening chasm is leaped without strain. But social affairs do not arrange themselves that way. "This kind goeth not forth but by much prayer and fasting." Doubtless present conditions reek with foolishness and injustice; doubtless a better order is attainable; doubtless brutal drudgery is needless in an age of machinery; doubtless poverty is a remediable disgrace to our civilization; but we can arrive at a better land, a concrete Altruria, only by patiently taking one step after another, by elaborating reform after reform. There can be no sudden transformation scene; but gradually the shadows will flee, the sky will lighten and the clouds fade until night passes imperceptibly into day.

The Story of Hymns

A NEWSPAPER does well that reprints regularly choice poems, hymns or prose that ought to be a part of the general reader's mental equipment. It was for the Chicago *Tribune* that the editor of this book made a selection of *One Hundred Hymns You Ought to Know.*[1] A concise explanatory note of hardly more than a hundred words accompanies each hymn. Here they are brought together and given a more permanent and attractive setting. Collections of this sort can hardly fail to be interesting, for they set the reader to wondering on what principles the editors have made their selections. For example, in this hundred are two hymns by Miss Havergal and but one each by Doddridge, Newton and Cowper. Here are more by Faber than by Wesley or Watts or Heber; one by Montgomery and two by both How and

[1] ONE HUNDRED HYMNS YOU OUGHT TO KNOW. Edited by *Henry F. Cope.* New York: Fleming H. Revell Co. $1.50.

Alford. Probably the popularity of the music to which the words are set weighed heavily in some instances. That must have been the case with Faber's "Pilgrims of the Night," and it was Mr. Sankey's singing that gave "The Ninety and Nine" its place here. As a rule, the choice has been wise, and some of the modern hymns are of the very best, such as Baker's "The King of Love" and How's "For All the Saints." The editor misleads in saying that the familiar selection given from Pope's "Messiah," "Rise, Crowned with Light," was printed in *The Spectator* in 1712. Not this short selection, but the whole "Messiah" was issued by Mr. Steele as No. 378 of *The Spectator,* May 14, 1712. Nor is it quite fair to say that nothing else by Pope has "found its way into the hymn books." Selections from the "Universal Prayer" have been included in Collyer's, Cotterill's and in many Unitarian collections. The articles about the eighteen *Famous Hymns of the World*[2] were first published in *The Delineator.* The writer has here collected stories and incidents connected with the authorship or influence of these hymns—illustrations such as are sought by those who lead services of song, and may be told so as to deepen the interest of the singers. The book would be improved, however, if its pictured illustrations were omitted.

In one volume two popular books by the late Mr. Butterworth, *The Story of the Hymns* and *The Story of the Tunes,*[3] have been united, condensed, and also enlarged and brought up to date by including in the study such modern hymns and tunes as have won recognition since the books were first published. When near death Mr. Butterworth himself passed over his manuscript to Mr. Brown, who has executed his difficult task not only with sympathy for his subject, but with no little original research. The result has been practically a new book, the pages on Gospel Hymns being, in the main, and that on the Hymns of Wales being, entirely, supplied by Mr. Brown. The method used has been to present each hymn with its tune as a normal combination "like a flower and its fragrance," and Mr. Brown has shown genuine appreciation of those tunes that are beloved of worshippers rather than of mere musicians. This work is more valuable than most of the popular books on hymns and also more readable.

A large number of the distinguished clergymen and laymen at the Denver Christian Endeavor Convention were asked to give a list of what they considered the most beautiful and helpful hymns, and the twenty-four hymns receiving the most votes have been printed by the Society for the especial use of its Juniors.[4] Each hymn is preceded by an account of the circumstances under which it was written and a biographical sketch of the author, by Amos R. Wells.

A Great Liberal Peer

An obvious and long existing gap in English political biography is now filled by Mr. Stuart Reid's *Life and Letters of Lord Durham,** for looking back over the history of the House of Lords since the beginning of the reign of George III it is impossible to name a peer who was more disinterestedly true to Liberalism, who had more to do with the formulation of Liberal principles, who was more loyal to all that today in England is understood by Liberalism, or who accomplished more for popular causes and political progress, than the first Earl of Durham. Durham died in 1840, within eighteen months after his return from his great mission in Canada. For his fame it is unfortunate that an adequate and authentic biography of him has been so long withheld; but now that the full records of his life are available, and all the drawbacks of his environment can be understood, he must be placed among the great English statesmen of the nineteenth century; and this in spite of the fact that he was of only two administrations, and that his official life at Westminster, as distinct from his service as

[2] Famous Hymns of the World: Their Origin and Their Romance. *By Allan Sutherland,* with an introduction by the *Rev. Henry C. McCook, D.D.* New York: Frederick A. Stokes Co. $1.20.

[3] The Story of the Hymns and Tunes. *By Theron Brown* and *Hezekiah Butterworth.* New York: American Tract Society. $1.50.

[4] Twenty-four Memory Hymns and the Stories. *By Amos R. Wells.* Boston: United Society of Christian Endeavor. 50 cents.

* Life and Letters of the First Earl of Durham (1792-1840). *By Stuart J. Reid.* Two vols. Pp. xvii, 409, x, 409. New York: Longmans, Green & Co. $10.00.

Ambassador at St. Petersburg and his five or six months as High Commissioner at Quebec, did not extend much over four years.

He was a Liberal in the darkest days of Liberalism. While he was of the House of Commons, altho he was a great landed proprietor, he opposed the enactment of the Corn Laws. He advocated Parliamentary reform and national education. He assailed the special privileges of the Church of England in so far as these privileges worked wrong and injustice to Nonconformists and Roman Catholics; and he was one of the earliest of the Liberals after the era of the Napoleonic wars to advocate peace, retrenchment and reform. Grey and other of the Whig leaders had advocated Parliamentary reform as early as 1793; but these men were not Liberals in the sense that Durham was. They realized that the then existing system of Parliamentary representation was indefensible. They were willing to pose as the upholders of popular causes. They were willing to make some reform in the Parliamentary representation; but their great care was never to carry Parliamentary or any other reform to a point where it would endanger what the Whig peers of the period between the American Revolution and the beginning of the reign of Queen Victoria used to lescribe as "their order."

By inherited traditions and by matrimonial ties Durham was closely connected with the Whigs. He could have been of the Whig party and shared more fully than he did in the good fortunes of the Whigs after 1828; but whether of the House of Commons or of the House of Lords he took a line of his own; and, much to the annoyance of Grey and Melbourne, could never be kept within the narrow confines of Whiggism. He had broader views and a larger vision than any of the Whig statesmen or politicians with whom he was officially associated; and in the great crises of his political life—the Reform Act of 1832 and the Rebellion in Canada in 1837—he fearlessly acted on his own conception of duty; and today he stands justified before the world in the course he took at each of these momentous junctures in British history. Responsible government for the colonies resulted from Durham's famous report on conditions in what are now the Provinces of Quebec and Ontario; and he made a bold struggle in 1832 for a measure of reform which should have some democratic characteristics. The Act of 1832 would have been a miserably disappointing measure had Durham not been of the Grey administration; for by 1832 Grey had lost the little enthusiasm he had ever had for Parliamentary reform, and apparently he would have been content to form a Whig Government and drop the question of reform if it had been practicable to do so. Grey and his Cabinet of Whig peers conceded just as little as would suffice to tide them over the crisis and save appearances for the Whigs who had supported reform when it seemed that their party was never to regain power.

The background which Mr. Stuart Reid sketches for Durham is admirable so far as concerns his English political activities. It is less commendable as regards his brief career in Canada, for here much is lacking to make clear the unwholesome political conditions which brought on the Rebellion of 1837 in Upper and Lower Canada.

Running Water. By A. E. W. Mason. New York: The Century Co. $1.50.

This book is not so well written as "The Four Feathers" by the same author, yet the charm of it is unique. It is an old-fashioned romance, which offers a complete rest from modern ideas and gives little or no impression of reality. The only facts in it are the Alps, not the literary Alps of the tourist, but the real mountains unadorned by quotations. And as Silvia Thesiger, the heroine, climbs Aiguelle d'Argentière, we feel the strain, the cold, the invigorating hardship. Silvia, by the way, belongs to that class of heroines who figured so extensively in the fiction of the 1860's, when ladies still said their prayers upon moonlit window sills with their hair down. She is born of very bad parents, but gifted with beauty, ideality, and she dreams of running water. (The very slight use the author makes of this circumstance scarcely justifies the title, but it is his book and

nobody's business.) She moves about in the tale to save a worthless scamp from a deserved fate with a good deal of stage acting, just as women used to do in novels long ago when their lover got drunk or killed a rival. Indeed this was the dramatic duty of every heroine. Now it looks a little queer, far-fetched, to see the lovely Silvia turning her back upon an admirable gentleman who wishes to marry her, because she hopes to save a degenerate, but that is the attraction of the story, its reversion to an elder fashion in romantic ideas. It is pieced together with morals so elaborated that they flare out like billboard posters. And the reader is obliged to think that the part the author does not tell of Strood and the other blacklegs in the story would be more interesting than anything he has told, which is very incomplete and often irrelevant.

The Working of the Railroads. By Logan G. McPherson, lecturer on Transportation at the Johns Hopkins University. New York: Henry Holt & Co. Pp. 273, vii. $1.50.

The value of his book lies in the fact that it is a clear and concise exposition of its subject, written by one who is both a practicable railroad man and a trained economist. The author, besides having an academic connection, has been active in the railway service a number of years, having been associated formerly with ex-President Loree, of the Baltimore and Ohio Railroad, and more recently with the late President Spencer, of the Southern Railroad. The book itself is the result of a course of lectures recently delivered at the Johns Hopkins University. Tho based in the main on the writer's experience and observation while in the railway service, and containing much technical information not readily accessible to the general reader, the work is designed as a primer rather than as a treatise. It endeavors to present an accurate conception of the underlying principles of railroad practice in their social and political as well as economic aspect. The railroads are portrayed as vast complicated organisms with numerous functions and activities, correlated by a central nervous system, at the head of which is the president and board of directors. Tho treating principally of the organization, the work and the inter-relation of the different departments of a railroad company, the author devotes considerable space to such topics of general interest as the determination and regulation of railroad rates, and the relations of common carriers to the State and the public. His explanation of the theory of railroad rates, tho somewhat brief, is exceedingly clear and comprehensive. Much stress is laid upon the fact that it is practically impossible for a railroad to gauge its charges by the cost of service, since only a relatively small share of each item of railroad expenditure can be allocated to a particular service. The author is optimistic in his views regarding future improvement in the relations of the railroads to the public, tho he freely admits that as long as railroads are controlled by human beings there is likely to be abuse and corruption. But, just as in politics, such evils, owing to certain social forces, are gradually being minimized, so in the industrial world certain economic factors are tending to eliminate mismanagement and greed in the administration of public service corporations.

The Social Life of Scotland in the Eighteenth Century. By Henry Grey Graham. New York: The Macmillan Co. $2.50.

Rarely well has Mr. Graham done what must have been to him a pleasant task, for his book is rich reading. Before and long after the union of 1707, Scotland was isolated and desperately poor. Slavery existed there. Superstition and smuggling and every other crime flourished, save highway robbery, but including the feeing system. This last the Scots heroically suppressed by treaty against it and giving servants fit wages. The system has, however, reinstalled itself. Even the beauty of the country could not appeal to the traveler who perforce stopped at the Scottish inns. Goldsmith said: "Hills and rocks intercept every prospect." But, then, Goldsmith's rank would not let him dance at an Edinburgh ball, tho his money admitted him to it. The forerunners of Peter Peebles and Dominie Sampson are here, for the law and education furnish much matter; and here is shown the heartiness and homespun

character that live in the poems of Fergusson and Burns. The serial sermon is now gone. In those days a preacher spent a year and a half on two verses of the Psalms. In Scottish they might be:

"Blythe may the man be, who airts-na his gate by the guidin' o' the god-lowse; an' wha stans-na i' the road o' wrang-doers; an' wha louts-na at the down-sittin' o' lowse jaukers. Bot wi' the law o' the Lord is his hail heart's-gree; an' owre his rede sigheth he baith day an' night."

During the week, however, society was active. Knives and forks were sometimes used; one drinking glass or pewter of good size served the company. The ladies took snuff and tho never drunk they admittedly became intoxicated. Metaphysical discrimination ran in the law also, for Allan Ramsey, when his theater was closed, sued Edinburgh, and the judge decided he had been damaged, but not injured! The doctors had the most preposterous medicines. The patient might equally have welcomed good health or death—the latter a sure escape. Mr. Graham knows the minutiæ of Scottish social life, and with anecdotes full of the peculiar national humor and notes that should not be skipped, shows us the people of thrift, faith, struggle and romance more fully than we have ever yet seen them.

Aunt Jane of Kentucky. By Eliza Calvert Hall. Boston: Little, Brown & Co. $1.50.

When it comes to telling tales, the shrewd old dames of the common people have the advantage of the grand old dames of the fine people. The latter are apt to revert to the war, or to the more or less inspired love affairs of their youth. And usually between first love and the grave there is a long, barren hiatus of which they do not speak at all. It is that hiatus which Aunt Jane of Kentucky fills with the stories which compose this volume. And altho they are not ornamented with battle flags or illustrated with haggard lady loves on red battlefields, they do not lack in dramatic interest. They are memorials tenderly and wittily told of simple, honest folk who lived according to their lights and perversities in that narrow strip of consciousness which lies exactly between Heaven and Hell, and which gave a certain scriptural poignance to life that we miss now. The author who listens to Aunt Jane, and who records the stories, has added much to their beauty by her sympathy of expression.

A Great Archbishop of Dublin: William King, D. D., 1650-1729. Edited by Sir Charles Simeon King. With portraits. New York: Longmans, Green & Co. Pp. xii, 332. $3.00.

It is somewhat difficult to assign a place to this volume of remains. It can hardly be called a biography; for it contains only the translation of a fragment of autobiography — forty-two pages — writen in Latin by the Archbishop, and covering little more than half of his life from his birth to the troublous days of the Civil War in 1650 to 1697, when he was still Bishop of Derry, and before his promotion by Queen Anne to the Archbishopric of Dublin. Besides this fragment, the editor has included the will of the Archbishop, a short account of the King family, a number of letters written by the Archbishop and others addressed to him, and finally some miscellanea, parts of which have very little connection with the subject of the volume. These disconnected sections of the book are not linked together by any narrative, and, altho there are numerous footnotes, these do little to supply the gaps in continuity left by the letters. The most that can be said for the book is that it furnishes illustrations not only of the character and activities of Archbishop King, but also of some of his contemporaries and of Irish life and politics. Probably the most interesting letters are those from Dean Swift to his Archbishop. These show the Dean in both his amiable and unamiable moods, as, altho he appeared to have a high regard and real liking for King, he was quick to take offense and to give utterance to his pique in a most huffy letter. Archbishop King himself is shown in a most refreshing light. In a time when self-seeking and supineness characterized the Irish church, he was upright, unselfish, hard-working and sincerely devoted, not only to the interests of the church, but also to the people—Roman Catholics and Dissenters as well as those of his own flock.

Literary Notes

...The Presbyterian Board of Publication issue a full report of the first convention of the Presbyterian Brotherhood held last autumn at Indianapolis. The pamphlet bears the title of the organization.

....Art, music and faith are blended in Mr. Ernest Newlandsmith's recent essay, *The Temple of Love,* as in his former "Temple of Art," which received considerable favorable notice. (Longmans, Green & Co. $1.20.)

....Rev. Robert John Floody is the author of a careful and instructive history of the institution of a religious day of rest, which now appears in a second edition. (*The Scientific Basis of Sabbath and Sunday.* Boston: Herbert B. Turner Co. $1.50.)

....Canon Beeching, of Westminster Abbey, has deservedly an excellent reputation as a thoughtful religious teacher, and his good name will be sustained by the publication of six lectures on *The Apostles' Creed.* (New York: E. P. Dutton & Co. $1.)

....The Rev. Dr. W. J. Dawson tells the story of his conversion from a literary homilist to an evangelistic enthusiast in *The Empire of Love.* The personal experiences of the gifted author make the book both fascinating and profitable. (Fleming H. Revell Co. $1.)

....The Rev. W. L. Watkinson, the British clergyman who paid a pleasant visit to American cities and colleges some months ago, has issued a volume of thoughtful doctrinal sermons with the suggestive title *The Transfigured Sackcloth.* (E. P. Dutton & Co. $1.25.)

....*Through the Sieve* is a fitting title for a collection of aphorisms and brief sayings, principally on religious themes, by the Rev. Addison Ballard, D.D. Several of these pithy observations are taken from the author's contributions to THE INDEPENDENT. (New York: Robert Grier Cooke. $1.)

....The third volume of *Avery's History of the United States* will soon be published by The Burrows Brothers Company, Cleveland. There are to be fifteen volumes in all. As we said in our review of the work (May 31st, 1906) this is a clearly written, accurate and comprehensive popular history, handsomely printed and illustrated with numerous maps and pictures, well chosen and well executed.

Pebbles

A MEMORY EXERCISE

Not Needed After We Have Spelling Reform.

By George Thornton Edwards.

A LIMB, or lough; a cliff, or clough;
A drain, or sough; a mire, or slough;
A tool, or plough, all rhyme with *cow.*

While tray, or trough; allowance, clough;
Ay also cough; all sound like *off.*

And thigh, or lough; as lake, or lough;
The canine, slough, will rhyme with *dark.*

But rugged, rough; to cast, or slough;
The bird called chough; enduring, tough;
Enough's enough; all rhyme with *stuff.*

Yet paste, or dough; conjunction, though;
Its mate, although; all rhyme with *foe.*

But the well known hiccough
Rhymes well with *kick-up.*
While only through
Will rhyme with *too.*

MARK TWAIN.

MARK was born in Missouri, and that explains a good deal. Even as a child, when the boys went in swimming, Mark used to sling mud—a habit which he has retained.

Mark has style—oh, Gee! Why, honestly, Mark's style would make a lady jealous, provided she weren't particular. He has various forms of inanity, chiefly the ignorant dialog, the semi-witty dialog, and the plain dialog. It is hard to criticise these, since each one seems a trifle worse than the two others. A few bargain sale samples follow:

(1.) Ignorant Dialog.

Then the Child of Perdition he says, "*Who* was sheddin' tears?" "Why, *I—,*" says Jim. "Well, *he—,*" says Ed. "Well, what did they do with the bar'l?" says the Child. "What's the price of eggs?" says Jim. "Haw! Haw!" says the Child. "Can *you* believe his that there those yarn?" says Ed. "Well," says the Child, "I c'n swaller a third if you fellers'll worry down the rest." "He! He!" says Jim. "Haw! Haw!" says Ed. "Honk! Honk!" says the Child.

(2.) Semi-Witty Dialog.

"I've come to interview you," said the young fellow, as I was gazing at the beautiful mountain obscenery. "Let me see," said I, taking down Roget's Thesaurus. "How do you spell it?" "I-t, it," he answered, biting the table. "Where were you bred?" "In a bakery," I answered, rapidly scribbling a love story for the Boston *Globe.* "No, no; where did you use to live?" "At home," said I, expectorating on the ceiling. "I remember when I was at John B. Moran's political funeral——" "When did he die?" the reporter interrupted. "When he heard that Cambridge voted license," I replied, "he had heart failure." "There's no such word as fail," he said. "Back up, anything below D," I roared. "Flee, varlet!" He flaw.

(3.) Plain Dialog.

"Do you believe in fairies?" "No," I replied; "the last one I met said 'ain't' and 'goil' and choich.'" "Oh," muttered King Edward, "she wasn't a fairy, was she? Where did she live?" "Chelsea," said I. "Yes?" asked he. "Yes," said I. "Oh!" said the King. "Aha!" says I. "Ahew!" said the King. "Don't mention it," said I. "I won't," said the King.

Think of it! Writing on space at that! Who would not be an author?—*Harvard Lampoon.*

Editorials

Relying upon the People

A REMARKABLE victory, creditable alike to himself and to the people, who came to his support, has been won by the Governor of New York. Only a few weeks ago his entire program of reform legislation seemed lost. By a combination of corrupt or otherwise unworthy legislators in both parties his attempt to remove an incompetent Insurance Superintendent had been thwarted, and it was the open boast of these men that their conspiracy against his Public Service Corporations bill would surely be successful. This measure is the most searching and comprehensive one of its kind ever taken up for action in an Eastern State. They defied him and jeered at him, believing that he must fail because he would neither seek their aid by a political bargain nor subdue them by the lash. His reliance upon the people was to them the mere dream of a visionary. But Governor Hughes continued to believe that his confidence in the people of his great State was not misplaced.

To the people he appealed again and again, but not in bitterness of spirit, nor with personal criticism of any who opposed him. Nor could there be found in his public addresses any sign that he was losing courage. He would not consider the possibility of failure. If to some of his friends the situation seemed hopeless, he seemed not to share their anxiety. His trust in the people was unimpaired, and to them he still looked for the help he needed.

His estimate of them has been vindicated. On the 8th inst. the tide turned. In response to some compelling force, on that day the Republicans of the Senate in conference voted unanimously to support his policies, and the chairman of the Republican State Committee (whose recommendations for appointment to office he had not approved) called a meeting of that body for similar action. By that committee the Governor's entire program was approved in resolutions which mentioned each legislative project and emphasized the necessity of giving support to the Public Service Corporations bill. Then the Republican majority of the House in caucus by unanimous vote followed the example of their party associates in the Senate, deciding that the bill must be passed without any of the amendments by which the agents of corporations had attempted to make it worthless. As Raines, the leader of a bi-partisan conspiracy, had unexpectedly gone over to the Governor's side in the Senate, so Speaker Wadsworth surrendered in the House, or Assembly.

On the following day the bill, in the form desired by the Governor, was passed in the House without a dissenting vote. Even the Democrats, after the foreseen rejection of amendments proposed by them, joined their partisan foes in supporting this important measure. Action in the Senate is yet to be taken, but concurrence there with the House appears to be assured.

This interesting change of attitude was due to no concession on the part of the Governor. He had made no bargain with his opponents. He had sought to conciliate no one of them by favor bestowed or promised, nor had he attempted to move any one of them by threats. Not from him or from his office had come the pressure to which they yielded. It had been applied by the people of New York.

Governor Hughes had appealed to them and they had responded. Appeal, in the strict sense of the word, however, does not properly characterize his public utterances. He never begged for help, but simply explained his legislative projects, clearly and forcibly setting forth his convictions as to the people's need of them. Because of his respect for their intelligence and honesty, and because of his unshaken confidence that they would act wisely and effectively after becoming informed by one whom they could trust, he believed that this would be sufficient. And it was. They were convinced that he was unselfishly devoted to the public interest, that he was keeping his campaign promises, and that he had steadfastly refused to use the power of his office for the promotion of

his policies, except in the most open and legitimate manner. They realized that his trust in them was sincere and unlimited, and they determined that he should not rely upon them in vain.

The mails were burdened with the protests sent to unworthy legislators by their indignant constituents and by other citizens of the State. Day by day the pressure thus exerted grew in force. Supplemented by the arguments and denunciations of personal conferences, and by the sharp criticism of local newspapers, it soon became intolerable, and the opposition to the Governor's reforms melted away.

An important and essential agency in all this work was the press. Even the best of Governors can reach but a few persons directly by his public addresses. But when the entire respectable press of so great a State publishes those addresses, and from day to day, by favorable comment, or even by criticism of some detail of the legislative program, stimulates popular interest in them, no one whose opinion is worth anything remains unenlightened as to the issues pending. When, in addition to all this, the Governor's purposes are explained and his ideal political methods described in influential journals by keen and sympathetic press correspondents stationed at the capital, an irresistible public sentiment is created.

It is true that certain conditions are essential for a successful movement of this kind. The Governor must be an honest, competent and courageous man, a real servant of the people. And the measures he commends must be clearly and unmistakably for the public good. In this instance, both of these conditions were present. As for our people themselves, they always deserve to be trusted by such a Governor, but they need to be informed thoroly concerning the measures in behalf of which their influence is desired. Some time is required for showing them what their duty is and how it can best be performed. If Governor Hughes's just demand for the removal of Kelsey had been made last week for the first time, the Senate of New York would not then have voted to keep this incompetent Insurance Superintendent in office.

"In Peace, Prepare for War"

HORACE said it in sounding Latin and Washington said it in stately English, and every statesman of this generation has said it in every category of logic and rhetoric. What we want to accomplish before the century closes is to banish the maxim from the mouths of Presidents and lawgivers, and make it their chief aim that peace shall pave the way only for wider reaches of peace.

Great Britain proposed that the Hague Conference should put in its program the proposition for reduced, rather than increased, armaments. But Germany objected. Germany said, Britain can afford to propose this because she has a larger navy than we have; so we must be allowed to enlarge our navy to approach hers. Britain had proposed to withhold appropriations for more "Dreadnoughts," but when Germany refused to consider the limitation of armaments Great Britain responded by giving orders to build two more "Dreadnoughts." She did not want to; but her proposition having been rejected she felt obliged to continue on the endless task of keeping ahead of the competitors, who will not cease to try to overtake her.

And now comes another complaint from Germany, which bears on this same question. Business conditions have been so flourishing in Germany of late, and the demand for labor so great, that emigration has almost entirely ceased. Germans are not fleeing in such numbers to this country or to Brazil—to the German colonies they have never cared to go. But in Germany itself, and especially in the rural districts, there has yet come to be a serious lack of labor. The explanation given is that the young men are all drafted into the army, and when they have served their term they have lost the taste for agricultural labor. They want to go to the cities and serve as clerks or waiters, or in any other capacity that does not involve farm work, so that it is almost impossible to get the fields tilled and the crops gathered. That is the natural result. If people will have a big army, the biggest and best in the world, they must thereby discourage to that extent the arts of peace, and especially of agriculture, which is

the most peaceful of all arts. War drives men from the fields of grain to the field of battle, while Peace replies:

"Vascite ut ante boves, pueri;
Submittite tauros."

Evidence has lately been presented to show that France is declining in the wealth of its common people. They are not able to provide as abundantly for their daughters at their marriage as they were some years ago. But meanwhile the expense of the army and navy is increasing, because Germany increases hers, and the money that should go to set up new families has to go to make more cannon and replace the ships of war that are blown up with more and larger vessels. What other result could we expect? for war is ravenous to consume everything.

Now we have another case in an address in London last week by Mr. Deakin, the Prime Minister of Australia. He was speaking before the National Service League, a society whose business it is to cultivate a military spirit and teach the country to build more and bigger ships of war. He said he believed that universal compulsory military service would soon be adopted in Australia, because military training is a good part of education. Besides, said he, "there can be no greater guarantee of peace than having every household share in the risks of war"; and Field-Marshal Lord Roberts approved. Now if there is any country in which there is no danger of war it is Australia. It has no dangerous neighbors, and the only danger is that it may attack New Guinea or some other unprotected island. The only war we can think of is a war of independence; and that Great Britain would not resist. She would yield everything to her self-governing colonies.

There is one curious force now growing up to withstand the growth of the war spirit; it is that of international socialism. The statesmen have been surprised this past week at the result of the Austrian elections, the first under the new law of universal suffrage. It has greatly weakened all the Nationalist parties, the Germans and the Czechs, while the Social Democrats have increased their numbers from 11 to 56, with second elections to follow. The explanation given is that the people are getting tired of the inter-racial conflicts, and incline to a creed which recognizes human brotherhood and fosters no national enmities. The hope of peace between Germany and France is in this same faith, which holds that those who have the same purpose of social regeneration are comrades whatever their nation or language. The Church has not been very effective in the past years in checking war, much as it prates of peace on earth and good will to men. This international spirit, with its advocacy of peace and its hatred of war, is a saving virtue which strengthens the Socialist movement in Europe.

The United States has joined with Great Britain in asking the Hague Conference to consider the limitation of armaments. And yet we are increasing our own, and we shall do so until some kind of mutual agreement shall be reached. It is to be hoped that the proposition rejected may become a chief stone of the corner, just as at the first meeting at The Hague our proposition for a Court of Arbitration was the best fruit of the Conference.

The Sane Mind

We are glad to see in a widely read daily newspaper the right kind of a review of the wrong kind of a book. This in itself is a phenomenon curious and interesting enough to be worthy of mention. The object of too many newspapers is to make money by getting advertisements, by getting readers, by printing such a miscellaneous array of information and misinformation, science and quackery, sense and foolishness, appeals to refined tastes, and undisguised vulgarity that no human being can tell just why he buys the thing or looks at it, while all human beings keep on buying and looking just the same. It's a great art to make a newspaper.

But because it is an art strictly practical in its nature, having for its purpose the creation of economic profit, the newspaper does not always attempt to offer really scientific guidance or discriminating criticism. When, now and then, the thing is actually done, we feel that the human race must really be making some

progress. It must be that the number of those readers who want sense and information actually is increasing.

The worst kind of a bad book is one that either maliciously or stupidly misleads readers who are looking for alleviation of suffering. Misinformation on theology or bridge whist can be endured. Misinformation on politics and the whereabouts of Mark Twain does comparatively little harm. But misinformation on cancer cures, Bright's disease, nervous prostration, tuberculosis and the inter-relations of mind and body does incalculable mischief in terms of concrete pain that men, women and children needlessly suffer.

So it did us a world of good when a leading newspaper the other day had the courage in a courteous way, yet remorselessly, to point out that a certain book which is misleading thousands of uninstructed readers has put the whole philosophy of mind and body upside down. The book gives expression to one of the most plausible and tenaciously held of popular fallacies, namely, that dangerous fatigue and exhaustion, tending to culminate in nervous prostration, despair and sometimes self-destruction are largely a product of worry, and can be prevented by the naïve acceptance of the self-control prescription. This is not quite so crude a specimen of quack therapeutics as is the notion that pneumonia or typhoid fever can be cured by a state of mind, or broken bones set and knit by due concentration of thought, but from the standpoint of physiology it is neither more nor less absurd.

Worry is a symptom—not in any true sense a cause. That is to say, it comes with, continues with and disappears with certain other purely physical conditions. Excessive or too prolonged physical exertion, hours of over-wrought emotion, whether joyful or depressing, intense application of mind—all involve a rapid waste of tissue which fills the body with deadly toxic products, both directly and by affording favorable conditions to the multiplication of bacterial life, which in its turn gives off toxic products. It is when the body is thus charged with poisonous matter that we first feel the sense of fatigue, then become depressed and finally settle down to "worry."

No mere effort of will can terminate this condition. On the contrary, the effort, by further hastening tissue disintegration, may seriously aggravate the whole evil state. The best possible cure is to be found in rest, change of scene, diversion of attention and relaxation, all of which give nature a chance to throw off the toxic products and rebuild tissue; in short, to clean house and repair damage.

The American people is seriously suffering from the popularity of modes of quackery which tend toward the making of mental unsoundness, depression, credulity, irritability, overwrought passion. What we need to cure these ills is a healthier mode of life, less hurry, less attempt to accomplish more than our strength warrants, more of the quiet, relaxing sort of pleasures. These we shall never get thru the teaching that, by an ignoring of the physical life and a greater intensity of mental attention to our troubles, we can set all things right. The sound body is the necessary antecedent condition of the sane mind.

"The Sons of Martha"

THE English language still has a great poet, and Kipling has not yet lost the swing and vigorous charm of his strength. He is no such sensuous, mellifluous artist as Swinburne, who wearies us with his form, and whose goaded passion fails to reach our heart; no such exquisite, dreaming, far-away master of Arthurian fancies and questionings of present hopes as is Tennyson; no such stout and lawless prophet of Eternal law and assured conquest as is Browning; but Rudyard Kipling has a wild, sometimes brutal, message of liberty and humanity, which can speak the fellowship of humanity, the feelings and rights of the under-man, and can search the finer and hidden sympathies of nature, and all with a fresh originality which has added a new feature to English verse.

He still holds the magic of his "Departmental Ditties," which first gave him fame, altho of late years, with his prose writings, he has more seldom, and sometimes too rudely, challenged the muse. His last poem, "The Sons of Mar-

tha," has but eight verses of four long lines each, but it marks all the fresh genius of his best earlier poems. In doctrine and form it suggests one of the greatest and most daring things he ever wrote, "To Wolcott Balestier." The latter had seven varying feet to the line, with irregular internal rimes, while these lines have eight feet, with each line evenly divided by its rime. The type is one which Kipling favors, for it invites strength rather than grace. But it is in the thought of the two poems that they seem to agree: for both have a doctrine of service, which is made the better part of religion.

In his lines to his deceased brother-in-law Kipling began:

"Beyond the path of the outmost sun, thru utter darkness hurled,
Further than ever comet flared, or vagrant star-dust swirled,
Sit such as fought and sailed and ruled and loved and made our world.

"They are purged of pride, because they died, they know the worth of their bays;
They sit at wine with the Maidens Nine, and the Gods of the Elder Days;
It is their will to serve or be still, as fitteth our Father's praise."

It is this same doctrine, that the worthy men are those who serve the world, which is taught in "The Sons of Martha." Kipling is so saturated with biblical thought that he naturally takes his text from the Scriptures. He begins:

"The sons of Mary seldom bother, for they have inherited that good part;
But the sons of Martha favor their mother of the careful soul and the troubled heart;
And because she lost her temper once, and because she was rude to the Lord, her Guest,
Her Sons must wait upon Mary's Sons—world without end, reprieve, or rest."

The contrast is of the trustful, receptive saints of meditation and of the commonplace, vigilant saints of all work; and Kipling describes them, the men who hew down the mountains, who run the engines, whose glove handles the deadly wire, who supply safety and easy comfort to the sons of Mary. And he concludes:

"They do not preach that their God will rouse them a little before the nuts work loose;
They do not teach that His Pity allows them to leave their work whenever they choose. . . . . .
"Not as a ladder from Earth to Heaven, not as an altar to any creed,
But simple service, simply given to his own kind, in their common need.

And the Sons of Mary smile and are blest—they know the angels are on their side.
They know in them is the Grace confest, and for them are the Mercies multiplied.
They sit at the Feet, and they hear The Word—they know how truly the Promise runs.
They have cast their burden upon the Lord, and—the Lord He lays it on Martha's Sons."

The startling end of the last line is strikingly Kiplingesque. The poem glorifies work, not as toil, but as service for mankind, and so is healthful and sound. But it fits this age, for Kipling is the mouthpiece of its activity, its responsibility, rather than of those sweeter, quiet meditations which we used to hear from the two sweet English poets who have preceded him. His is the whizzing enginery of present accomplishment, and its virtue and praise; while Tennyson and Browning lived or dreamed in the silver memories of the past or the golden hopes of the future. It is the muscular, the manly, the victorious, which he loves to chant—and it is worthy; and yet we seem to lack that other human and womanly touch of grace and peace which give a sunset glory to the rest which follows service. Something might be said for Mary; and there might also be some recognition of Martha's daughters as well as of Martha's sons.

Rudyard Kipling has not lost cunning. He can still write a great poem; and if poems bring less coin to his coffers than do stories, much as we admire his splendid tales, we wish he might be willing to seek still his greater fame from his verse.

Teaching Exodus

THE ten million Sunday school students in the United States and Canada are now passing from the study of Genesis, with which they have been occupied for nearly five months, and are busying themselves with the stories of Moses and Pharaoh, the Red Sea and Mount Sinai, as recorded in the Book of Exodus. The difference between the two books is very marked. In Genesis the interest is in persons and the stories concern individuals, altho, as Augustine noticed long ago, tribes and nations are

in the mind of the author as he writes of Jacob and Esau, Reuben and Judah. But in Exodus the affairs of peoples are to the fore, not hidden in personalized history, but described in plain speech, and while in certain chapters individuals are prominent, the particular person derives all his interest from his importance to his people. Exodus is therefore a sociological document, and the superb use which may be made of it in application to present social conditions has been exhibited in a masterly way by the Rev. Dr. Charles R. Brown in his recent Yale lectures on "The Social Message of the Modern Pulpit."

In Genesis, further, we have the fireside stories of a deeply religious people about their ancestors, their traditional places of worship and the forefathers of other peoples with whom they became affiliated. Some may not like the title, but Gunkel's little book on "The Legends of Genesis" describes accurately the literary character of the first book of the Bible. It is a book of folklore. But when a really good English commentary on Exodus appears—we have none as yet—the title of its first section will not be "Exodus, a Collection of Legends." For in Exodus we pass over into history, not history as a modern would write it, but composed for edification and religious instruction, and with much idealization of fact, yet nevertheless it is history and calls for a different sort of literary appreciation from that of the Book of Genesis.

What a magnificent field for study and investigation is presented by these forty chapters on the emancipation of the Hebrews! The background is Egypt, whose authentic history reaches back to 4000 B. C., which had a highly developed religion and a worthy civilization as long before Israel learned even the name of its God as we are separated from the times of Christ. Egypt worked out belief in immortality, which John Fiske called "the greatest achievement of the human mind." Her ideas of cleanness and impurity, sacred and secular, influence to this day the greater part of the civilized world. No nation save Babylon has had deeper influence on the thought and life of the human race than this African people; and the student of Exodus who uses a history of Egypt like that of Professor Breasted to make clear to his mind the background against which the narrative of Moses should be conceived, has traveled no small distance toward an understanding of the progress of the world toward civilization.

A deficiency of most popular study of the Bible is that it is not historical. Abraham is pictured out under the stars as a man of all the knowledge with which the Apostle Paul was blest; and a story from the life of Jacob is given a Christian turn as readily as an incident in the experience of Peter. As a matter of fact, careful study of Exodus will prove that Isaac and Joseph did not even know the name of the God whom the Hebrews worshiped. First under Moses did Jehovah, or Yahveh, or Yahu, become the God of the tribes of Israel; and what God the "fathers served beyond the river" we have no means of knowing. Exodus, therefore, furnishes an excellent opportunity to begin the study of Hebrew religion as a thing of growth and development, which it assuredly was, and one who will trace the first beginnings of this faith, as described in such a book as Professor Budde's essay on the "Religion of Israel to the Exile," will hold the founder of Israel's faith in not less honor than one who accepts at their face value the idealized accounts of the historians who wrote centuries after Moses had done his work.

Caution may be commended to those whose eyes are opened first to the fact that it is necessary to "go back of the documents," as von Ranke said, in order to secure accurate knowledge of biblical history. It may be said that there are usually three stages in progress toward correct use of scriptural documents. In the first, or uncritical, stage, the record is taken as it stands, discrepancies are unreconciled, difficulties unobserved, and the picture is confused and unreal. In the second stage it is perceived that the tradition in some respects cannot be true, and therefore the whole is cast over as worthless. Unfortunately many never get beyond this view of the matter, and this philistine attitude is encouraged by the strenuous advocates of the literal acceptance of the whole. The wise student will seek to discover the truth which

lies back of the tradition and thus to arrive at a knowledge of the real history.

We venture a word of caution as to expecting too much from the monuments by way of corroboration of the biblical narrative, and against receiving with too great simplicity the "proofs" from archeology which ardent apologetes adduce. Excavation has not brought to light the name of Moses or Aaron, nor does it vouch for any communication and argument between Rameses II and any of his subject peoples. We have no inscription thus far which establishes by itself either the residence of Israel in Egypt, the enslavement, or the escape, much less the pillars of fire and cloud and the overthrow of an Egyptian army in the Red Sea. A certain class of writers, whose scholarly industry is unquestioned, go altogether too far in drawing conclusions from the products of excavation. Thus it is altogether far fetched to interpret the stele of Merenptah, which Petrie discovered in 1896, as implying that Israel had then no territory of its own, and that the first born had been slain, as does Professor Sayce. No one would have thought of such an interpretation save for the biblical record. Because Naville's researches at Tel el-Maskhuta have laid bare the city of Pithom, referred to in Exodus i:11, it does not at all follow that the monuments prove that Moses was adopted by Pharaoh's daughter, as the same author would seem to imply. The monuments do establish that the situation implied by the biblical records, when *critically* studied and interpreted, is the situation which actually existed. Further than that they do not go, and to try to build or re-establish faith on the basis of their testimony is to proceed by an altogether mistaken method.

Plans for City Improvement

THEY call them "group plans," which implies, we gather, the grouping together of the various proposals for the outward betterment of a city, so as to make one harmonious whole. The magnificent plan for Washington devised several years ago is an example.

That the "group plan" is taking a firm hold on the minds of American municipal workers and experts is indicated by the fact that within the short space of a year there have been published the "Report of the Capitol Approaches Commission of St. Paul," the "Boston Society of Architects' Report on Municipal Improvements," "Report upon a System of Public Reservations for the Metropolitan District of Providence Plantations," the "Report of the Arsenal and Armory Commission to the Connecticut General Assembly," "A City Plan for St. Louis" and the "Report of the City Improvement Commission of New York." This is a remarkable record of civic aspiration and planning, the significance of which is enhanced when we recall that it is but a part of the development of the past decade along these lines, and that other reports are still in process of formulation.

The importance of formulating a plan early, which it may take many years to carry out, is shown in a significant statement at the very beginning of the St. Paul Report, which may be taken to be more or less typical of all. The committee proceeded on the theory that what others have done or are doing Minnesota and the city of St. Paul can do; the development of the approaches, they were convinced, would be undertaken sooner or later, but the first steps should be taken promptly, so that advantage can be taken of the low prices at which the property needed can now be acquired, if the contemplated plans are to be carried out at the minimum cost. All that is necessary at present is, they say, the acquisition of the land, and its development can be carried out gradually as the means of the city will permit. In spite of the magnitude of the expenditure for the land alone, the burden can be so distributed between the city and the State, and so spread over a series of years, that the burden will not be felt by the humblest taxpayer. To provide any adequate setting for the State Capitol, even tho far more modest than that recommended and tho offering no distant vistas, would cost the State, even at present prices, fully as much as this plan will require, and, furthermore, would mean a lump payment instead of the small and rapidly dwindling annual interest payments proposed.

The Boston Report is unofficial, but represents a thoughtful study of subjects of public concern, in the hope that it will eventually lead to a fuller official discussion and investigation by competent authorities into the whole subject of the municipal development of the city. The report points out that building operations are at present at a standstill, and that great spaces are allowed to isolate sections, congest traffic and prevent expansion; and then refers in detail to such obstacles as the Boston and Albany car yard.

The Providence and St. Louis reports are the most important and suggestive. The former deals almost entirely with the public parks and reservations. The latter is far more comprehensive, and represents two years' active work by the Civic League of St. Louis to provide a working plan for the development of the city. As the report points out:

"If a well defined plan is not now determined upon it will have to be done by the future St. Louis at a tremendous cost. To avoid this mistake, the Civic League has drafted this report, which it now submits to the citizens for their approval, and to the city officials for their consideration and adoption. It is not expected that the plans, contemplating an expenditure of more than $25,000,000, will be carried out within the next few years, but they will furnish a guide so that when a public building is erected, the park system extended, or a statue located, it will be done right instead of wrong, and some effort will be made toward the attainment of the practical ideals included in these recommendations."

What these cities are doing other cities should do. It is not enough to create a park here and a fine public building there. The problem is a larger one, and includes all the open spaces, all the approaches, the laying out of broad avenues, the fit location of public buildings and whatever belongs to the landscape engineer. Unfortunately, it is not until a city is almost overgrown and it is too late for the best results that the importance is felt. The new cities ought to take up the task early, and at least purchase land for public purposes while it can be done to the best advantage.

A Farmers' Trust

The American Society of Equity is the title chosen by a respectable element of American farmers and sympathizers, their object being to organize landtillers and direct producers in such a way as to secure better profits for farm, orchard and garden. Efforts have been made to ensure the complete endorsement and co-operation of labor unions, farmers' clubs, granges and, to some extent, outsiders, and with some measure of success. The fundamental principle advocated is to withhold crops from market until increased demand places prices at the option of the grower; if this plan could be carried out completely, we should have to add, "at the mercy," as well as at the option, of the grower. The article by the president of this new movement, published elsewhere in this issue, informs us that the organization expects to provide granaries, warehouses, elevators, cribs, hay barns, cold-storage houses, etc., for the use of farmers, during periods of low prices—which we imagine will be a large part of the time. The charge for such storage is not mentioned, but it will be an item. The movement is certainly a very ambitious attempt at creating a national produce Trust. We have to bear in mind that in all this world there is no other class of people more individualized than American farmers. They are not apt to co-operate beyond what they can themselves oversee; and they have failed entirely in the way of stores and nearly as completely in the way of storehouses. Such a huge association as is proposed would endanger the producer quite as much as the consumer, and in course of time would necessarily become a power over agriculture. Repeatedly, on a small and on a large scale, the storage of crops for the purpose of securing higher prices has failed disastrously. Apples were stored in 1895 very extensively, but sold in the following spring at a loss. Potatoes at $1 a bushel in October are generally more profitable to the farmer than at $1.50 in the spring, counting out loss by decay, by shrinkage and by handling. This whole subject is now so complexed by the dominating force of increasing foreign markets that the only adequate cure is better educated farmers, personally trained to prompt and decisive action and aided by the bulletins of well-equipped Agricultural Colleges and Experiment Stations—and by the proposed international Institution of Agriculture, to be created at Rome.

Cornell Co-education

President Schurman has taken a manly and determined stand against the anti-feminist movement started by some of the undergraduates. He has announced that women have precisely the same rights as the men at the university, that the principle of co-education is absolutely settled at Cornell, and that neither trustees, faculty nor administrative officers have ever considered the question of modifying it. He promised that if any genuine case was reported in which a woman student had been treated unjustly or discourteously he would secure a redress of the injury or, failing that, the resignation of the official concerned. This ought to put an end to the agitation. If the young women of Cornell conduct themselves sensibly, insist on their essential rights firmly and modestly, and prove their capability and efficiency by their work, they will probably be able to secure such a share of the advantages and opportunities offered by the university as they individually deserve. As for "social recognition" from their masculine colleagues, that, like similar things, goes by favor and cannot be forced. It is easy to see what is the matter with the male students who want to get rid of the women. It is simply a case of arrested development by which the phenomena of the puerile period is carried over into the ephebic age. During puerility a certain degree of misogyny may be regarded as normal, but usually this attitude is outgrown and the youth comes to regard the opposite sex as having certain rights which he is bound to respect and even certain qualities which he is impelled to admire. This is the same idea which a fortnight ago we tried to express by calling the Cornell agitators "kids," but we were no doubt at fault in not using, as we have this time, the language customary in educational circles in discussing an educational question.

An Automatic Speech Regulator

The unfortunate experiences with long-winded speakers which Dr. Francis E. Clark told about last week and the similar experiences of all our readers have led us to devise a simple mechanism by which the time of a speaker can be automatically proportioned to the interest of the audience. It consists of a clock dial sunk in the speaker's desk or otherwise so placed as to be visible to him alone. When the chairman introduces him he sticks an electric peg into the margin of the dial at the limit of speech, say fifteen minutes, and when the minute hand reaches this point the speaker is rung off. But this method of apportioning time is too crude. It is only for chronometers that time moves at an equal speed. With human beings the rate is variable. When the speech is interesting time flies; when dull it creeps. What is needed, then, is a new kind of compensating balance wheel that will adjust the mechanical to the psychological rate. This can be done by a simple electrical device, unnecessary to describe in detail, by which the escapement of the speaker's clock is put in the control of the audience. At each seat, where it can be unobstrusively touched, would be placed a little lever like that on the back of our watches. If the listener is satisfied the clock ticks off the allotted interval at the normal or average rate. If any listener wishes it to go faster all he has to do is to move the lever toward "F." If he is alone in this opinion it has little effect, but if many of the audience agree with him the speaker finds his time slipping away rapidly and hastens to put in his best points, or, if he has none, to conclude and sit down before the bell rings. If a listener finds the speech interesting and wants it to last longer, he turns the lever toward "S" in proportion to the intensity of his desire. The speaker then finds his time holding out miraculously like the widow's cruse of oil, and he does not have to ask the chairman or audience for an extension. Any difference of opinion in the audience is settled quietly, automatically and justly. The annoying and indecisive conflict of hisses and applause is unworthy of this age of labor-saving machinery. Here is an automatic referendum, a democratic device, putting the control of the speaker in the hands of the auditors instead of leaving it with an autocratic chairman to interpret their wishes in a way that is necessarily embarrassing to himself and offensive to the speaker. The latter is supposed to

know by instinct when he is holding his audience, but these psychic waves cannot be relied upon. He does not really want to bore them, they do not want to be bored, but neither can ordinarily help it. The most egotistic orator would not talk to a single unwilling listener forty days and forty nights without stopping, but it amounts to the same thing when he runs over his time limit by half an hour with an audience of two thousand.

The Corey Marriage

The Brooklyn Congregational clergyman who married a rich divorced man last week said in an interview that Congregationalists have no rule against marrying divorced people. That is true, but that does not mean that they favor any laxer rule in divorce than the New Testament Scriptures authorize. In this case of the Corey wedding we suppose that Mr. Corey and his wife had got tired of each other—at least he of her—and had agreed to separate, and he may be said to have deserted her, made abundant financial provision for her and then did not resist her concerted application for divorce. If that is the case the desertion was no desertion at all, but a pretense and really a cheating of the law. If such were the case the divorce, tho legal, was unjustified, and the subsequent marriage should have been by a magistrate and not by a clergyman. To be sure, a clergyman cannot always tell whether divorce is justified, and he may be deceived. In this case there is no pretense of deception, and the minister, after his people had given him a piece of their mind, and the neighboring ministers had added their light to his darkness, owned up that he had blundered fearfully, and offered a humiliating but needed apology. In favor of allowing remarriage of a guilty party in a case of divorce, all that can be said is that it is somewhat safer for society that even a dangerous man should be tied by marriage than that he be left to run loose.

Chinese Immigrants

Hubert Howe Bancroft is the distinguished historian of California, and it is he that has come out, in the New York *Sun*, in a long defense of Chinese immigration. He says that the opposition to the Chinese has been purely political these fifty years, and that a large proportion of the best citizens of the Pacific States, farmers, merchants and manufacturers, orchardists, irrigationists and railroad men, the bone and sinew and brain of the land, are not opposed to Asiatic labor, more especially Chinese labor, but are in favor of the admission into the United States of the people of China on an equality with the other yellow men of Asia, the black men of Africa and the white men of Europe. He tells by what demagogic methods the cry against the Chinese has been made a success, and he concludes:

"Knowing, then, the men and the means and the purposes by and for which these several consummations have come to pass, it is quite plain that Asiatic exclusion as a policy protective of national or individual interests, or for any other reason or pretense, is and has been from the beginning a stupendous sham. The authors of it well know that their attitude is deceptive, their professions are insincere, their assertions hollow, and their reasoning false."

This testimony we believe to be true. We have had abundant evidence that the men who represent the churches in California have no sympathy with the Dennis Kearney crowd and the pot-house politicians behind them. These reputable citizens, however, have, as is often the case, lacked the courage of their convictions, and have allowed an injustice to be done which they might have averted. These dangerous politicians have of late almost involved us in hostilities with a nation whose convenient navy might easily have done more harm to San Francisco or the country than did the earthquake.

That our colleges are not all given over to Greek augments and the Odes of Horace will appear from the topics given, under the department of Modern Government, to the junior class at Amherst for their theses by Professor Grosvenor. Each student is required to write from 1,400 to 1,800 words on one of the following subjects, every one of which is timely and worth study:

"The Tercentennial of Virginia; The Last Municipal Election in Chicago; Political Conditions in Russia; Messrs. Moyer, Haywood

and Debs; *The Literary Digest;* The Practical Value of a College Education; Governor Hughes and Superintendent Kelsey; Immigration and the Southern States; The Peace Conference of April, 1907; The Political Consistency of President Roosevelt; Italia Irredenta; 'Unalienable Rights'; The German Emperor; The Typical Central American State; Increase of the American Navy; The Statehood of Cuba."

President Diaz's suggestion of a joint protectorate over the Central American States by the United States and Mexico is to be seriously considered. It is objected that we don't want to be bothered with possibly troublesome contingencies, and should keep out. But we are already in a measure responsible, and at any time may have to send forces to keep the peace. We, as elder and bigger brother, are not to consider ourselves simply, but the advantage of those little republics. Further, it should be considered that if Mexico joins with us it will save us from any danger of being compelled to annex those States, for Mexico will have equal or greater claims.

It was not a bad text which Dr. Landrith took for the opening sermon before the Presbyterian Assembly: "Possess the west and the south." The union last year with the Cumberland Presbyterians is a good step in that direction, and other steps are expected. The election of Dr. William H. Roberts as Moderator was a fitting tribute to the services of a man who has been the leader of his Church in the federation of the Reformed Churches, and also the leader of all our Protestant bodies in the Federation of Churches so admirably achieved last year.

It is not a bad idea that if any religious, or political, or commercial body thinks that incorrect instruction is given to students in a university it should set up a supplementary lecture course next door and invite the students to attend. But it is quite too much to ask that those lectures be credited to the students for their degrees, as a Catholic alumnus has asked for Cornell. No student need elect a course regarded as unfair, and any student can have time to take all the outside studies he chooses, as President Schurman says.

It is a real satisfaction to have a man of fine courage, like Clemenceau, at the head of the French Government. He has no hesitation in frankly, almost brutally, attacking and flouting his concealed opponents, and daring them to come to the open and not plot like mutes of the harem. Even the violent leaders of the labor unions he has no fear of, but tells them he and the people will have none of them. It is his courage and positive convictions that holds his majority.

A Yale senior stole a barber's pole; that was bad. He was caught and convicted of theft; that was good. He was let off with a seven dollar fine and costs; which was cheap. But conviction for theft bars a man from the right to vote as long as he lives: which he ought to have thought of before he became a thief. A course of instruction in the difference between a prank and a theft might be of advantage, and would relieve the courts of supplementing that department.

Mr. George W. Chadwick, director of the New England Conservatory of Music, asks us to deny the statement, widely published, that he has publicly said that institution does not want students who have to pinch and get financial help to get along. He declares that he only spoke thus of students who lack musical talent, while some way is always found to care for those who show real promise.

The Massachusetts Institute of Technology has been scouring the country to find the best man living for its head, and it has fallen on—believe it—a Grecian, a distinguished classical scholar, President Wheeler, of the University of California. That is really a victory for the breadth of the classical education.

Insurance

A Fateful Year

THE year 1906, according to a writer in the "Agents' Record" of the Travelers' Insurance Company, established the most fatal record of disasters on land and sea of any year in the history of this country. Some of the causes of accidents as set forth in this paper are worth careful study. Motor cars, which are now so much in the public mind, contributed to fatalities not quite 500 deaths. 1,184 persons were killed in burning buildings. 2,985 were drowned. Explosions killed 623. Falling and collapsed buildings cut off 483 lives. 599 persons were killed in mining accidents; 700 in cyclone storms; 205 died from lightning strokes, and electricity numbered 176 persons as its victims. 600 people were killed by the accidental discharge of firearms, and exactly the same number perished because of elevator accidents.

7,000 pedestrians met death on the public streets. Teams killed 5,000. The loss of life by ocean disasters during 1906 was 2,193, and on the Great Lakes and rivers 185 lives were lost. Deaths due to hunting accidents totaled 74. 34,000 were killed while doing their day's work. 60,000 people were maimed and lost either hand, foot, legs, arms or eyesight. We have grown accustomed to speak of the horrors of war, but the death roll in industry is viewed with comparative calm in spite of the statements made by the writer in the Record that the number of pedestrians killed more than equaled the number of the dead accounted for in any of the famous and world decisive battles of Waterloo, Austerlitz or Gettysburg. The number of pedestrians injured equaled the number of wounded in all three of these combined. The railroad, electric cars and ocean disasters caused more deaths than did the battle of Waterloo. Truly, after considering these figures, those who read them may well rejoice to find themselves still living.

AARON POUPENEY, of Minneapolis, Minn., was troubled with corns. In this respect he did not differ from a lot of other people. He followed a custom that has many disciples and cut them. Others have done the same with no ill effects. Mr. Poupeney, however, used in his corn-cutting a knife with which a blue pencil had previously been sharpened. Unforeseen, but perfectly logical, consequences followed, and blood poisoning set in and amputation of his entire foot became necessary. Mr. Poupeney had a policy of insurance in the order of United Commercial Travelers for $1,500, and when he came to himself and found that his foot was gone it appeared to him to all intents and purposes as an "accident" which loomed large. He resolved to have $1,500 in the way of consolation money, and straightway filed a claim with the insuring company for this sum. When payment was not forthcoming he began suit to recover. The case was dismissed on trial on the ground that the injury resulted from wilful, voluntary carelessness and was therefore not an accident caused "by external, violent and accidental means" as provided for in the policy. Mr. Poupeney will in all likelihood use a sterilized knife in future for his corns if he cannot get blood poisoning included in his policy as an accident hazard.

FOURTEEN of the thirty-one persons killed in the wreck of the Mystic Shriners' special train at Honda, Cal., on May 11th, were insured against accidents in the Ætna Life Insurance Company, of Hartford, Conn. This involved a loss of $110,500 on the part of the Ætna, which is perhaps the largest loss ever incurred by an accident company in any one disaster. The total amount which the Ætna Life had at risk on the lives of passengers on this train was over $150,000. The amounts payable for deaths in this wreck were all double the amounts insured, and in three cases they were triple the amounts insured, because of the fact that the beneficiaries were killed in the same disaster. The fact that nearly one-half of all who were killed carried their accident insurance in the Ætna Life is a striking tribute to the company and the confidence of the insuring public inspired by it.

Financial

Bond Investments

THOSE who study the securities market to find safe investments that are not to be of a temporary character will observe that the net yield of first-class railway bonds at present prices is about 4 per cent. These are such bonds as savings banks are permitted by law to buy. Other railway bonds of good quality may be found, whose yield is somewhat higher. There are railway notes that yield even more, but their life is only about three years. Investments in public service corporation bonds will give a return of from 4½ to 5¼ per cent. The investor must bear in mind that in many instances the revenue of these companies is subject to legislation. Industrial corporations, also, whose bonds yield about the same return, may be affected by legislation, by a decline of general prosperity, or by bad management. As a rule, however, their bonds are well protected. "To the high-grade municipal bond," says an authority upon bond values, "is generally conceded the first place for safety, because it rests upon the established credit of communities." It may be added that the payment of interest and the redemption of such bonds are insured by taxation in all communities that are well governed. There is a considerable variety of municipal issues, and in securities of this class the bonds of counties should be included. New York City bonds now net a shade less than 4 per cent., but all municipal securities cannot be measured by them. In the interior, and especially in the great agricultural States of the Middle West, one can find bonds issued for school expenses, drainage improvements, etc., whose net yield considerably exceeds 4 per cent. School bonds returning from 4¼ to 4¾ can be bought, and county drainage bonds yielding from 4¾ to 5¼. In the communities that issue these bonds, taxes must be paid. Taxes for school buildings and other educational facilities are paid more cheerfully than some others. In the case of drainage bonds, to the security afforded by a general tax and a progressive county's credit there is commonly added that of a special tax upon the land which is reclaimed or improved, and the increase in the value of the land is frequently very great in proportion to the cost of drainage. As a rule, the school and drainage bond issues are small. Securities of this class deserve to be considered by investors, who, of course, should take the ordinary precautions and acquire some knowledge of the character and condition of those who ask for the loan.

The Fidelity Trust Company

The Fidelity Trust Company is the name of the new trust company which opens its doors for business this week. It is located at the corner of West Broadway and Chambers street in the quarters occupied by the Irving National Bank. The president, Samuel S. Conover, was the president of the Irving Bank. Mr. Conover was born in 1869. When fifteen years old he entered the New York Mercantile Exchange. He was next in the service of the Southern Pacific Railroad for two years, and in 1891 entered the employ of the Fourth National Bank, where he remained for ten years. He was secretary to J. Edward Simmons, the president, and James G. Cannon, the vice-president, and had the opportunity of gaining invaluable banking experience. In 1902 Mr. Conover became vice-president of the Irving Bank and president in 1906. He is chairman of the Finance Committee of the Irving Savings Institution. The other officers of the Fidelity Trust Company are William H. Barnard and John W. Nix, vice-presidents, and Andrew H. Mars, secretary. Its directors include William C. Demorest, of the Realty Trust; Gerrish Milliken, of Deering, Milliken & Co.; James E. Nichols, of Austin, Nichols & Co.; George H. Sargent, of Sargent & Co.; Edward H. Titus, of Lord & Taylor; William H. B. Totten, the president of the Irving Savings Institution; James M. Donald, vice-president Hanover National Bank; Edwin E. Jackson, Jr., president and treasurer Boorum & Pease Co., and others equally well known. The company begins business under unusually favorable conditions with a paid-up capital and surplus of $1,500,000.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

More Indictments at San Francisco

Owing partly to the confession of Abraham Ruef, indictments were returned in San Francisco, last week, against several capitalists prominent in business and in the social world. One of these is Patrick Calhoun, president of the United Railways Company, grandson of John C. Calhoun and great grand-nephew of Patrick Henry. On the 24th fourteen indictments were found against Mr. Calhoun, Thornwall Mullaly, his assistant; Tirey L. Ford and W. M. Abbott, counsel for the railway company; Abraham Ruef and Mayor Schmitz, for bribing the Supervisors, or receiving bribes, in the matter of the overhead trolley franchise. Ruef testified, it is understood, that he received $61,000 and that $50,000 was paid to the Mayor. There were also two indictments against the Mayor for receiving bribes in the matter of fixing the gas rate at 85 cents instead of 75 cents. At the same time the number of indictments against President Louis Glass, of the Pacific States Telephone Company, was increased from 9 to 11, and one additional indictment was reported against Theodore V. Halsey, agent of that company, making a total of 12 for him. On the following day, 28 more indictments were announced, and among the accused were six millionaires. In one group were G. H. Umbsen, real estate operator and formerly Police Commissioner; B. E. Green, capitalist; W. I. Brobeck, attorney; and Abraham Ruef. Four of these are accused of bribing the Supervisors ($1,000 each) to procure a franchise for the Parkside Street Railway Company. In another group were Frank G. Drum, capitalist and manager of the Tevis estate; Eugene De Sabia and John Martin, capitalists and directors of the Gas and Electric Company; Abraham Ruef and Mayor Schmitz. The charge in these cases is that the Supervisors were bribed, with $750 each, for making the gas rate 85 cents. For bail on the indictments enumerated above nearly $800,000 was required. The money was furnished by all except Ruef. Mr. Calhoun has published two or three statements in defense of himself. He asserts that he and his associates in the railway company are innocent, and that Prosecutor Heney and Rudolph Spreckels have conspired to rob his company of its franchises and property in order that these may come into the possession of Mr. Spreckels. He also declares that the latter, to promote the purpose of the alleged conspiracy, instigated the strike by which the company is now embarrassed. Mayor Schmitz makes similar charges. He is now on trial for extortion before Judge Dunne, but the jury has not been selected. In support of a claim that Judge Dunne was disqualified, Schmitz asserted in an affidavit that the judge was engaged with Prosecutor Heney and Mr. Spreckels in a conspiracy to obtain control of the municipal government in order that they might procure street railway and water franchises of great value. Mr. Spreckels says briefly that he has assisted the investigators for the public good, and that he has no private purpose. He adds that the case against Mayor Schmitz is "absolutely complete,"

and that a confession from him is not desired. Reports have been published to the effect that the influence of the Standard Oil Company and the Southern Pacific Railroad Company was being exerted in behalf of Mr. Calhoun and his indicted associates. There appears to be thus far no evidence to warrant such reports, which seem to have been suggested by the appearance in Mr. Calhoun's interest of attorneys heretofore employed by the Standard Oil Company and the furnishing of bail by banking institutions in which the two great corporations are said to be largely concerned. Mr. Calhoun is a native of South Carolina. For some years he was prominent as a lawyer in the service of corporations. Since 1896 he has been engaged in the consolidation and development of street railway properties in Pittsburg, Baltimore, St. Louis, San Francisco and elsewhere.

Relations With Japan

Reports from Tokio have directed the attention of our Government to recent attacks upon Japanese in San Francisco. It appears that on the 21st, a Japanese restaurant and a Japanese bathhouse there were wrecked by a mob. No protection was given by the police, who were engaged elsewhere in repressing disorder attending the street railway strike. A report was at once cabled to Tokio by the Japanese Consul. Then Ambassador Wright speedily informed the State Department at Washington that this report had been received, and Ambassador Aoki called upon Secretary Root to take measures for the enforcement of the treaty. At the Secretary's request, Attorney-General Bonaparte at once instructed the District Attorney at San Francisco to make an investigation, and Governor Gillette was requested to use the power of the State for the protection of the complainants. Reports from Tokio say that the Japanese Government will never consent to an exclusion treaty.——General Kuroki went to New Haven last week, and was entertained by the officers of Yale University, of which many Japanese are graduates. To an interviewer in New York who questioned him about reports of possible friction between Japan and the United States, he repeated his assurances of national friendship and gratitude and said, with a laugh: "When you make war against us, we shall run away." A few months ago Japan ordered several million dollars' worth of locomotives here for the new railway in South Manchuria. Last week it was announced that the Government had also ordered here, for the same railway, $12,000,000 worth of equipment material, including freight cars and 63,000 tons of rails.

Trusts in the Courts

The trial of the Standard Oil Company and its seventy allied corporations for violation of the Federal Anti-Trust law, was begun at St. Paul, on the 24th, before four judges of the Circuit Court. Exceptions filed by the defendants were considered.——When Attorney-General Hadley, of Missouri, brought suit against the Standard Oil Company, of Indiana, the Waters-Pierce Oil Company, of Missouri, and the Republic Oil Company, of New York, alleging that they were violating the Trust law of his State by conspiring to suppress competition in Missouri, Judge Anthony was appointed by the Supreme Court to take the testimony. He reported last week that all of the Attorney-General's allegations were true; that the three companies were in unlawful agreement to suppress competition and control prices, and that they had deceived the public by pretending to be independent of each other. Therefore he recommended that their charters or licenses be revoked and that they be ousted from Missouri. It is expected that his recommendations will be accepted and followed by the Court.——Inquiry will be made by the Interstate Commerce Commission as to the assertions of Commissioner Smith, in his recent report upon the Standard Oil Company, that this company is ignoring and violating the new Railroad Rate law in its pipe line department. It is expected that new suits will be brought for this offense, the penalty for which may be imprisonment.——King Carlos, of Portugal, has conferred the title of baron upon E. V. Patterson, an American agent of the Standard Oil Company in that country.——Fines were imposed,

last week, upon the individual and corporate defendants in the Government suit against the Furniture Trust. They had pleaded guilty. F. A. Holbrook and each of two prominent corporations pay $5,000 apiece; for eleven other companies the fines range from $2,000 to $500. Having reviewed the methods used for controlling prices and contracts for church pews and school desks, Judge Landis said the legal penalties were inadequate. He "wondered why any man should descend to such methods" to make money. "I should think," he added, "that he would prefer to dig ditches at $1.50 a day."

Railway Questions

There was published in Boston, on the 24th, a report that E. H. Harriman had practically been exonerated by the Interstate Commerce Commission, because it could not be proved that he had violated the law. Chairman Knapp at once gave to the press the following denial:

"The statement is absolutely without foundation or excuse. The Commission has taken no action, reached no conclusion, and not even discussed the Harriman case of late. No report is likely to be made for some time."

Within a few weeks the courts will be asked to issue an order compelling Mr. Harriman to answer the questions which he refused to answer when on the witness stand. A final decision upon the Commission's application for such an order may not be reached in less than a year, but the Commission will make a report upon the investigation without waiting for it.——An investigation of the Hill railroads in the Northwest, which was interrupted some months ago by the illness of J. A. Loveley, special counsel, will soon be resumed.——In an address before the National Association of Manufacturers, last week, Commissioner Prouty said that the Commission should be empowered and required to take the initiative for the correction of unlawful rates and practices; and that its power with respect to the physical operation of railways should be like the control which it exercises over rates, in order that it might compel companies to furnish adequate facilities for traffic. Speaking of the relation of rates to capitalization, he said:

"Mr. Harriman's operations in Chicago & Alton did not directly affect rates upon that railroad system, but they did create a condition which is for all time a perpetual inducement to the imposition of unjust and unreasonable charges upon the patrons of that property. What has been done cannot be corrected. All that has become a vested interest which it would be both unwise and unjust to disturb, but in the future we can prevent a repetition of the past. When Mr. Harriman, by dealings like those in Chicago & Alton, enriches himself to the extent of many millions, he has not created that money. He has merely transferred it from the possession of some one else to himself."

——The two-cent law recently enacted in Pennsylvania, which becomes effective in October, is attacked by a suit in which the Pennsylvania Road asks for an injunction restraining the authorities from collecting the penalty imposed for a violation of the statute. Suburban and commuters' rates on the Reading Road in the vicinity of Philadelphia have been increased from 30 to 50 per cent. It is generally believed that this change is due to the new law. President Baer predicted that an increase of suburban rates would follow the enforcement of a two-cent rate.——Owing to complaints filed with the Commission, an inquiry will be made and a decision reached as to Pullman sleeping-car rates, which are alleged to be unjust, unreasonable and excessive. ——Having pleaded guilty to a charge of rebating in favor of the Sugar Trust, the Rock Island Railroad Company, in New York last week, was required to pay a fine of $20,000.——Among the contributions to the discussion about the quality of rails is the report of inspectors employed by the manufacturers that twenty-four rails were broken by one recent passage of a fast train from New York to Chicago. Charles M. Schwab, formerly president of the Steel Corporation, remarks that while open-hearth rails are superior to those made by the Bessemer process, the railroads must eventually seek rails made of steel with nickel alloy, which, he thinks, will cost about three times as much as those now in use.——Tried upon a charge of manslaughter, Joseph Thompson, conductor of a train that was wrecked at Gourock, Ontario (Canada), in September last, has been found guilty and sentenced to be imprisoned in the penitentiary for three years.

Cuba

It is reported that the work of constructing a sewerage system in Havana and of paving the streets of that city will soon be undertaken, by direction of Governor Magoon, under the contract awarded to a Philadelphia firm and inherited by the Republic from the Government of General Wood. Cock fighting is not to be permitted in the island under the rule of Governor Magoon. During the life of the Republic, the prohibitory order of General Wood was not repealed, and the present Government will not repeal it. Leading politicians and many other citizens have urged Governor Magoon to remove the ban placed upon this sport.——The army of occupation has maintained a high standard of discipline and sanitation, and has completed a military map of the entire island. This map, on which the minutest details of topography are marked, is said to be a model of its kind. It is said that by the aid of it an army of intervention could easily suppress such guerrilla warfare as Cuban revolutionists have been accustomed to carry on.——Ensign Alfred T. Brisbin, who was involved in the affray between American sailors and the police in Santiago, on April 30th, shot himself, with suicidal intent, on the 20th inst., and died on the following day. He was graduated in 1903 from the Naval Academy, to which he had been appointed from Pennsylvania. It is supposed that he became despondent, fearing that he would be court martialed for his conduct on the night of the affray.——A strike of the longshoremen has caused great disorder in Santiago. There have been several riots, and the Rural Guards have been called to the aid of the police.

Restless Central America

There had been, at the end of last week, no beginning of the predicted revolution in Guatemala. General Toledo was still in Nicaragua. A revolution in Salvador, in behalf of General Alfaro (Toledo's ally, who is said to be Zelaya's candidate for the presidency of Salvador), was reported on the 21st, but the existence of any revolt whatever was denied on the 24th by the Government. It appears that General Barahona, to whom Alfaro looked for help, was recently stabbed to death in one of Salvador's prisons. Some have thought that a successful revolution in Salvador was desired in order that Guatemala's President (Cabrera) might be overthrown by invasion from that republic with the aid of Toledo, coming up from the South, and of revolutionists entering from Mexico.——Complications have arisen concerning the attempt of President Cabrera to punish persons accused of plotting against his life. Some days ago, three men, believed to be those who had planned the explosion of subterranean mines under his carriage, were traced by Cabrera's forces to a house where, being attacked, they killed four Guatemalan officers and then committed suicide. Two days later, Cabrera's Council of War summarily sentenced to death nineteen men for complicity in the attempt to assassinate him. In this group were Mexicans, Spaniards and Italians. The members of the Diplomatic Corps at the Guatemalan capital united in addressing to Cabrera a protest, pointing out that only twenty days had elapsed since the explosion, saying that the accused men could not have had a fair trial, and asserting that they were the victims of false testimony. An official report of this incident was forwarded by the Mexican Chargé d'Affaires, who, with his colleagues, had asked that the sentences be annulled. Statements made at the Mexican capital and also by the Mexican Ambassador at Washington, indicate that Mexico may soon decide upon forcible intervention. Eight thousand Mexican soldiers are now encamped near the boundary.——Costa Rica's Consul General at New York, in a published statement, opposes the confederation said to have been planned by Zelaya, saying that the republics are not ready or fitted for such a union, that the experiment can be made only by force, and that it cannot be successful.

German Affairs

There is a severe labor conflict in Berlin in the building trades. The men demanded a 10 per cent. increase of wages and an eight-hour working day, instead of the present eight and a half or nine hours. All efforts at compromise were fruitless, and finally the Master Builders' Association

declared a lockout against 60,000 employees, which will involve some 40,000 others — masons, bricklayers, carpenters and allied trades.——A movement has been started in Germany among the workingmen similar to that of the *Jaunes* in France. It is called the Fatherland Labor League, and has for its object to combat Socialism and the tyranny of the labor unions.——The police have made numerous arrests among the Russian students in German universities, because of their revolutionary sympathies. Explosives and formulas for making bombs were discovered and there are rumors that an attempt was to be made against the life of the Kaiser. The students arrested are of both sexes. Some have been expelled from the country and others held for trial.——A sentence of unusual severity for *lèse majesté* has been imposed upon a mason's assistant named Brüning, who was accused of the alleged crime of sticking out his tongue at the Emperor William as he passed in his automobile. Brüning insists that all he did was to shout "Hurrah." As he was proven to have been tipsy, the public prosecutor advised imprisonment for two weeks, but the court imposed a sentence of nine months.—— The Emperor William has ordered the statue of Heine taken from the gardens of the Villa Achilleion, at Corfu, which he has recently purchased.——Governor Horn, of Togoland, German Southwest Africa, has been sentenced by the Imperial Disciplinary Court to dismissal from the service and reduction of pension for ordering in 1903 the punishment of a negro which caused his death. The native had stolen a cash box and was sentenced to receive fifty strokes of the whip and was left to die at the stake in the sun for twenty-four hours without food or drink.——The Reichstag has passed a bill for a commercial *modus vivendi* between the United States and Germany, to last one year from July 1st. The chief opposition was from the Conservatives and Agrarians, who declared that German interests were being sacrificed because they get no relief from the heavy American tariff duties. Count Wehner-Posadowsky, Secretary of the Interior, admitted that the chief concession gained from the United States was a more normal method of administration. The remark of a Socialist deputy in debate that the condition of American workingmen was better than that of German workingmen was greeted with great laughter and indignation.

The Rejection of the Irish Bill

The Convention of the Irish National party, held at Dublin May 21st, voted unanimously to reject the Government bill introduced into the House of Commons by Augustine Birrell providing for the establishment of an Irish Council to control most of the administrative departments except the courts and constabulary. The Convention was attended by 3,000 delegates, not two-thirds of whom could get into the Mansion House Hall. A large number of bishops and priests were present, the ecclesiastical authorities having emphatically denounced the bill, chiefly on account of the exclusion of Catholic clergymen from the Council which controls education. Father David Humphreys declared in the convention: "The bill is directed against the Catholic Church. It would drive the priests out of the schools and let in the devil. In two generations it would change Ireland into a France." John F. Redmond, chairman of the Irish Parliamentary Party, presided over the Convention and presented the motion repudiating the bill, altho he had been consulted by the Ministry in its preparation, and when it was presented to the Parliament he had expressed a qualified approval of it. As soon as he reached Ireland, however, and found that public sentiment was strongly and unanimously against any compromise whatever on the Home Rule question, he gave up his efforts to secure its acceptance. He has practically lost his position as leader of the Irish people, for the advanced Nationalists repudiate him and the Cabinet can no longer put confidence in him. In presenting to the Convention the resolutions against the bill, Mr. Redmond denied that any Irish member of Parliament was committed to its support. It was unworkable and would end in disgrace and disaster, and its failure would be used as an argument against Ireland's capacity for self-government. He declared:

"The Liberal Party must drop the Roseberyite idea, and must come back to the standard of Gladstone. People talk of an alliance of the Irish Party with the Liberals. The Irish Party is independent. It can have an alliance with no English party that does not put Home Rule in the front of its platform."

In the Convention were many Americans—Richard Croker, who presented $500 to the fund; John O'Callaghan, secretary of the United Irish League; T. B. Fitzpatrick, treasurer, and other officers. In one letter from America a $10,000 contribution was enclosed. In his speech Mr. O'Callaghan said:

"Do you think that the task of Mr. Bryce in America is going to be made any easier because his colleagues have thrown in the face of the Irish people this measure, which you today will throw in the faces of his colleagues with contempt? So long as England gives to the Boers who fought her more home rule than Ireland the Irish-Americans will prevent the alliance with the United States which England so greatly desires."

The resolutions adopted by the Convention were as follows:

"That this Convention, representative of Irish national opinion, emphatically places on record its profound conviction that nothing can satisfy the national aspirations of Ireland or bring peace and contentment to our people but a measure of self-government which will give the Irish people complete control of their domestic affairs.

"That having considered the Irish Council bill introduced by the Government, we declare that it is utterly inadequate in its scope and unsatisfactory in its details and should be rejected by the Irish Nation, and we regard the production of such a measure by a British Government pledged to Home Rule as confirmation of the position we have always taken—that any attempt to settle the Irish problem by half measures would be entirely unsuccessful, and we call upon the Irish Party to oppose the bill in the House of Commons and press upon the Government, with all their strength and power to introduce a measure for the establishment of a native Parliament with a responsible Executive having power over all purely Irish affairs, and at this crisis in the fortunes of Ireland we invite all the Nationalist forces of the country to unite in support of our representatives in Parliament, and enable them effectively to press for the speedy and genuine settlement of the Irish question."

The extreme wing of the Nationalists is the Fein Sein ("for ourselves") Society, which is promoting the use of the Gaelic language and urging a boycott of English goods. It advises the Irish members to withdraw from Parliament and claim representation at the coming Hague Conference to secure "the settlement of the international dispute between Ireland and England by the Court of Arbitration." The rejection of the Irish bill by the Irish themselves increases the embarrassment of the Liberal Government. It has failed more ignominiously than Mr. Birrell's other bill, for, unlike the Education Bill, it cannot be used as a count against the House of Lords.

The Effect of the Imperial Conference

The Imperial Conference does not seem to have accomplished anything of importance either in the way of plans for identifying the financial interests of the colonies and the mother country or of promoting good will and mutual understanding among their representatives. Almost all the proposals presented by the colonial premiers were rejected by the Government, and several of the members of the Conference have expressed their bitter disappointment. Sir Robert Bond, the Newfoundland Premier, in particular, is said to have declared the conference "a failure and a sham from beginning to end," because the Colonial Secretary, the Earl of Elgin, refused to disturb the *modus vivendi* in regard to the fisheries which the British Government has arranged by direct negotiations with the United States without consulting the interests of Newfoundland. According to some of the papers, he is said to have accused the Government of deliberately humiliating and neglecting the colony in order to curry favor with America. In the House of Commons, Winston Churchill, Under Secretary for the Colonies, denounced the reported quotations from Sir Robert Bond as baseless and impudent fabrications, and expressed his surprise that a person recently created a peer of the realm (Lord Northcliffe, formerly Alfred Harmsworth, of the *Daily Mail*) should have been willing to let a newspaper under his control employ for political objects methods of such transparent mendacity. Sir Robert Bond in an authorized interview expressed himself in the following more moderate language:

"The tendency of the dual jurisdiction that was erected by the *modus vivendi* is calculated to and did lead to disregard of the constituted

authorities of Newfoundland. I am deeply disappointed at the result of my effort to obtain justice for my colony inasmuch as I only appealed for justice and responsibility such as is sanctioned by the constitution we possess."

Sir William Lyne, Minister for Trade and Customs of Australia, in addressing the Australian Chamber of Commerce in London, accused Ministers Asquith and Churchill of having adopted an almost offensive attitude against the premiers. He said the colonial representatives had been treated unfairly and their subjects misrepresented in the official summaries. Alfred Deakin, Premier of Australia, said the members of the conference were treated in London merely as tolerated guests, and that they would continue their struggle for tariff preference, notwithstanding the obstruction of the Liberal party. He said he believed that universal compulsory military service would be established in order that Australia might be in condition to protect her own interests.——The white miners on the Rand are engaged in a strike which it is feared will result in serious disorder. All the British miners in fifty of the leading mines are out. The proprietors of the mines demanded three drills a day instead of two. They say that the men have been earning an average of $3,000 each a year, and it was necessary to reduce the amount paid for contract piece work. The strikers in a body marched to the Ferreira and Robinson deep mines, tore down the barricades, and attacked the men who continued at work. The mine owners refused to say that the strikers would never be re-employed. Dutch and Chinese are taking their places. The Colonial Secretary, J. C. Smuts, who was one of the ministers of the Boer republic during the war, has called out 1,000 regular British troops for the purpose of maintaining order. In an attempt made by the strikers to stop work on the Crœsus mine in Johannesburg the cavalry dispersed a mob.

The Women in the Finnish Diet

The first Parliament of Finland elected by universal suffrage was opened at Helsingfors May 25th by a speech from the throne, read by Governor-General Gerhard. Under the new constitution the Government of Finland has placed in the hands of a single national assembly the Landtag, tho the Senate, which is responsible to the Emperor, has the veto power. The opening session was in a temporary hall in the Fire Brigade building. It was preceded by a service in the Nicholas Church, to which the members of the Diet, according to the ancient usage, went on foot. The procession was especially brilliant and attractive on account of the variety of costume. A large number of the members wore the academic dress of the universities from which they had received their degrees. Others were in military uniform, and the Socialist members for the most part adopted peasant costumes. Miss Mina Silliampe, formerly a servant girl and now editor of a paper devoted to the interests of that class, wore the customary servant's kerchief and long apron. There are nineteen women members in the assembly, the first time that women have been elected to a national Parliament. They range in age from twenty-five to fifty-four years, and differ widely in politics and social position. Prominent among them is the Baroness Alexandra Grippenberg, who is head of the Finnish Branch of the International Women's League, and has represented it in France, England and the United States. She is masculine in appearance, wearing short skirts and short hair, and is a member of the conservative Old Finnish party. Miss Dagmar Neovius represents the Swedish People's party. She was principal of a school in Helsingfors, which was broken up by the Russian authorities. Among the other women are Miss Lucina Hagman, principal of a woman's high school in Helsingfors and member of the Young Finnish party, and Mrs. Maie Talvio, novelist and advanced thinker. The husbands of two of the women members are also in the Diet. The special objects for which the women representatives will work are the establishment of civil instead of religious marriages, equal wages for both sexes in the same kind of work, equal rights for illegitimate and legitimate children, and the prohibition of the sale of alcoholic liquors. The Socialists number about seventy out of the two hundred members of the Landtag. They have joined with the Young Finns, who are nearly equal

in number, to control the assembly. Judge Svinhufvud, of the Young Finn party, who was degraded and exiled by the Russian Governor-General Bobrikoff, was elected president of the Diet. The vice-presidents are Dr. Af Ursin, a Socialist, altho of one of the ancient noble families, and Baron Palzen, of the Old Finnish party. The Senate has offered to resign in order that the representatives of the people may have unrestricted power.

Reaction in China

The reform movement in China has in some inexplicable way been checked, and the reactionary element is in the ascendancy at the court. A month ago Yuan Shih-kai, the enterprising Viceroy of the Province of Chi-li, had the only army that amounts to anything in China, and his protégés were filling the offices of the newly established administrative bureaus. He secured for a Yale graduate, Tang Shao-yi, the important post of Governor of the Province of Mukden in Manchuria, the first time a foreign-educated Chinese had been placed in such a position. Shih Chao-shi, a graduate of Cornell, was appointed chief adviser on railroad affairs. There were numerous other similar appointments to Government positions at Pekin and in the provinces, all of them Chinese instead of Manchus, often Cantonese, and most of them educated abroad. Now Tsen Chun-hsuan, one of the most prominent of the reactionaries, has the favor of the Empress Dowager, and the recent appointees are being removed. Yuan Shih-Kai and Tang Shao-yi have been impeached. Prince Ching, another reactionary, is made the president of the Military Board. Sir Chentung Liang-cheng, former Minister to the United States, who was slated for the Board of Foreign Affairs, will find his party out of power. Revolutionary outbreaks are reported from several provinces, especially at Wongkong in the Uping district of Chinchu. An attack has been made on the German mission station at Lien Chow, but the missionaries escaped. This is the place where five American missionaries were killed October 28th, 1905.

The Russian Duma and People

The Duma has formally expressed its disapproval of the policy of terrorism by adopting a resolution expressing its joy at the discovery of the plot to assassinate the Czar and its indignation at the attempt. The resolution was passed at the opening of the session, and the Social Democrats, the Social Revolutionists and part of the Group of Toil absented themselves when the action was taken. Premier Stolypin explained to the Duma that the Department of Public Order and Security obtained information in February that a criminal conspiracy had been formed in St. Petersburg, and on April 13th twenty-eight members of the society were arrested. Their plan, the Premier said, was to assassinate the Emperor, the Grand Duke Nicholas Nicholaievitch and himself. Reports have been exaggerated and no persons were implicated except known revolutionists. They were all young, only three of them over twenty-five. Premier Stolypin warned the Duma that the Government would not under any circumstances approve of the forcible expropriation of land except in the exercising of the right of eminent domain for roads, irrigation works, etc. The action of the Agrarian Committee of the Duma, including expropriation as a feature of the land bill which they are preparing without consultation with the Government, was entirely irregular and unjustifiable. Besides, the price which the Constitutional Democrats propose to pay for the land, $14 per acre, is less than half its real value. The Government, he said, was willing to assist the peasants to purchase land from the landlords at a fair price and distribute it to the peasants by the aid of the Peasant Banks. The Duma passed by a vote of 176 to 146 an appropriation of $8,750,000 for famine relief purposes. A proviso was attached declaring the right of the Duma to examine the records of the Government's past and future handling of the relief funds. A sensation has been created by the publication of a pamphlet by Professor Ozeroff of Moscow showing the extensive squandering of Government money.

PENNSYLVANIA'S NEW STATE CAPITOL.
This design is by Joseph M. Huston, and in many features follows closely the original drawings of Henry Ives Cobb.

Pennsylvania's Palace of Graft

BY LOUIS SEABER

[As the political reporter for the Philadelphia *North American*, Mr. Seaber has followed closely the Capitol building scandal, and its effect upon the political situation He has reported the proceedings of the Legislative investigation upon which the present article is based.—EDITOR.]

PENNSYLVANIA'S four million dollar State Capitol, which was secretly decorated at an additional cost of $9,000,000, has become a national scandal. In a recent discussion of the graft in it and the effect of the exposure, a potential political leader remarked:

"What fools those fellows were! Had they delivered the goods according to the specifications, instead of trying to flim-flam the people, there would have been no scandal—only a few newspaper stories about extravagance for political effect, and then, the thing would have been forgotten

"If you give the people what they desire they will be satisfied. They are like a man who buys a watch for $100. He finds out that he has been swindled, that the watch is brass, and he never forgets, and he's always 'kicking' If, however, the watch is really gold, but cost twice what it is worth, the man may 'kick' a bit, but sooner or later he will be satisfied."

After the destruction by fire of the old Capitol, the Pennsylvania Legislature of 1897 gave first authority for the erection of a new building and, in a competition between architects, the drawings of Henry Ives Cobb, prominent in New York and Chicago, were accepted. Mr. Cobb designed a building estimated to cost not much more than $500,000 for the "shell," and part of the Capitol as it stands was erected under Mr. Cobb's supervision.

Without official warning—in the way peculiar to Pennsylvania—Mr. Cobb's services were terminated in 1899. William A. Stone then was Governor and, from the beginning, his term was stormy politically. In the end, Stone had a quarrel with most of the Republican State leaders. There is little doubt that, as originally contemplated, the Capitol was viewed with envious eyes as an opportunity for graft; but Stone, in his quarrelsome mood, surprised the political interests by having the Legislature of 1901 provide for a Capitol Building Commis-

sion, of which he was to be the president, and limit the cost of the structure "completed" to $4,000,000.

In a second competition among architects, the design of Joseph M. Huston, of Philadelphia, was accepted. Huston's design was remarkably like Cobb's and in the investigation now under way it was testified under oath by a draughtsman that he had been employed by Huston "to copy Henry Ives Cobb's original drawings of the Capitol—the unfinished building begun by Cobb." This draughtsman told how he had been locked in a room in Huston's office to do the work, how Cobb's initials had been cut from the blue-prints to prevent identification. Comparison of the present building with Cobb's drawings indicates that many of Cobb's artistic ideas were taken by Huston. Huston collected a fee of $184,736 for the work.

Governor Stone was succeeded in office in January, 1903, by Samuel W. Pennypacker, a Philadelphia Judge of high integrity, and a eulogist of Quay, who had picked Pennypacker for the Governorship in a critical situation. Ex-Governor Stone was in a strong position as president of the Capitol Commission, and he exercised unusual precautions to prevent even a suspicion of graft in the erection of the building. In a way, the architect influenced the Capitol Commission, and the specifications were changed frequently, resulting in each case in lessening the cost of the work to the contractors.

Such alterations which interfered with the architectural effect included the substitution of three-piece granite blocks for the sixteen pairs of monolithic Corinthian columns under the dome; three-piece blocks for monolithic pilasters of the front of the main building, between the wings; seven-piece granite work over windows instead of three-piece; stained birch wood for carved mahogany.

In the course of time, the Stone Commission announced that the Capitol had been built—completed actually within the $4,000,000 appropriated!

Meantime, the new building's interior was being modelled into a palace of gaudy colors and gilt. Ordinary wainscoting was replaced with polished white marble, or rich mahogany, or, as in the Governor's rooms, with hand-carved oak. Heavy tapestries were hung from window tops and velvety carpets were laid over expensive parquetry flooring. Enormous bronze chandeliers were dropped in great numbers from the ceilings and the side walls. Elaborately ornamented bronze standards were placed in corridors and elsewhere as plentifully as trees in a forest. Carved mahogany furniture was stocked everywhere.

Meantime, too, Pennsylvania was having a political fight. In November, 1905, William H. Berry, an honest Democrat, was elected State Treasurer by independent Republicans and Democrats, to the dismay of the Organization Republicans who had controlled the State's treasury for many years. It was significant that, between Berry's election and the time of his induction into office (in May, 1906), most of the $9,000,000 spent for Capitol decorations was paid out. As the time of the dedication of the Capitol—October 14, 1906—approached, the State campaign was being fought and Berry was stumping Pennsylvania. It was under those circumstances that, from the stump, the State Treasurer declared:

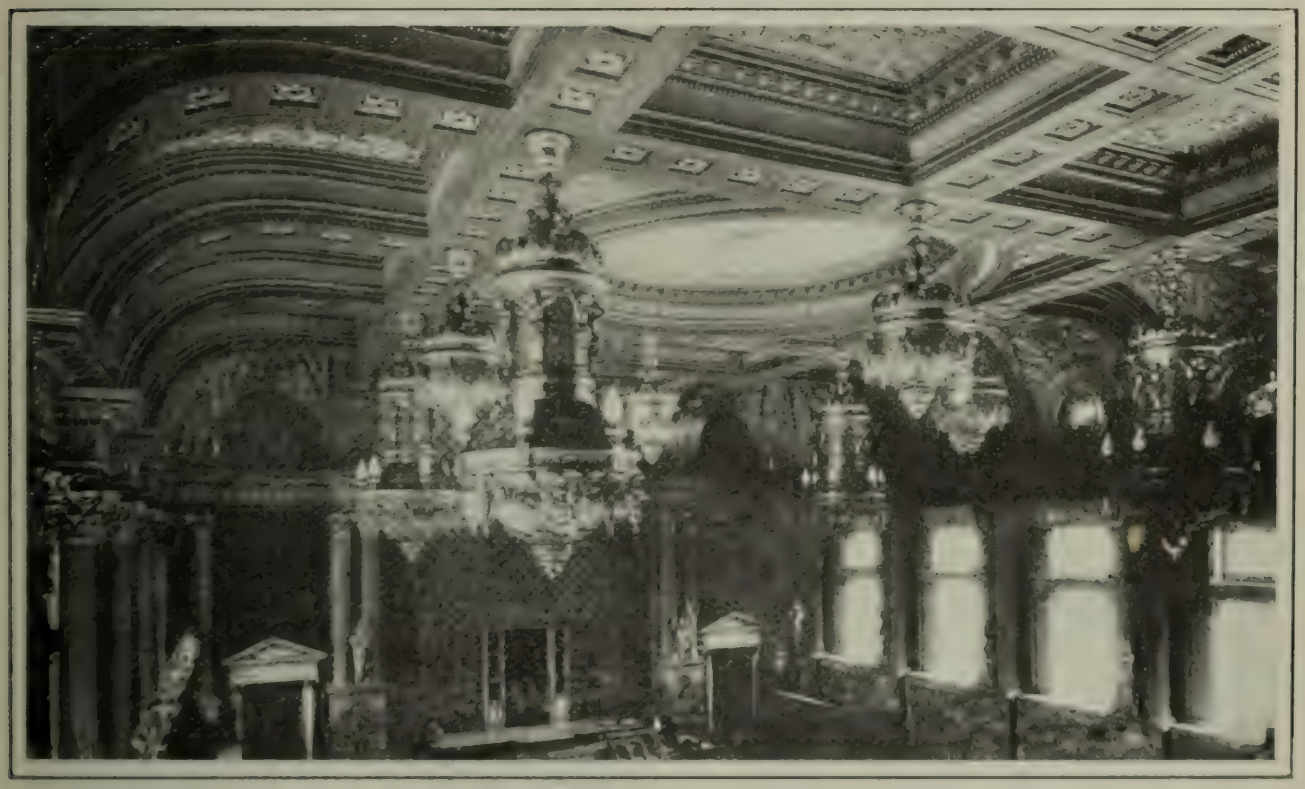
"It will surprise the taxpayers, perhaps, to know that their Capitol cost nearer ten millions than four."

Berry's disclosure went unbelieved for several days. When Berry reiterated the charge, the whole State answered with the challenge, "Prove it!" Berry replied:

"Yes, the State Capitol cost nearer twelve millions than ten!"

His words were too seriously spoken to be dismissed as mere campaign talk. Little by little the State Treasurer told what he had learned of the drainage of the treasury to enable Huston, the architect, to do his wonderwork. For the next six weeks of the campaign all the newspapers of the State were filled with sensational stories of the way in which the Capitol and the State had been "trimmed" at the same time. Edwin S. Stuart, Republican candidate for Governor, pledged himself to a thoro investigation of the scandal (he has kept his promise faithfully), and the Organization was compelled to issue two explanations a week in answer to State Treasurer Berry.

To afford a clear understanding of



the method by which $9,000,000 could be spent secretly it is necessary to explain that by an act of 1895 the Governor, the State Treasurer and the Auditor General constitute the Board of Public Grounds and Buildings, having control of general repairs, alterations and improvements. Supplies for the year are purchased by the board by contract with the lowest bidder in an open competition. The active agent is the Superintendent of Grounds and Buildings.

When the Capitol was to be trimmed, with carpets, furniture, electric light fixtures, etc." Not the least idea was given as to the quantities which would be required.

As the schedule was prepared, some of the more important items were thus described:

Item 22—"Designed furniture, fittings, furnishings and decorations of either woodwork, stone, marble, bronze, mosaic, glass, and upholstery, 'per foot,' maximum price, $20."

Under that meager paragraph, John H. Sanderson, an interior decorator of Philadelphia, the successful bidder, fixed

CEILING OF HOUSE OF REPRESENTATIVES.

The two candelabra in the front weigh 7,500 pounds each. A chandelier or a bracket was placed wherever possible, and the upper part of the house presents the appearance of an electric light fixture display room. For chandeliers the State paid $4.85 per pound.

in 1904, Governor Pennypacker was president of the board, and the other members were Frank G. Harris, then State Treasurer and an up-State Organization leader, and E. B. Hardenbergh, Auditor General, formerly a train conductor. It was distinctly provided by law that the proposals for supplies should be "for the year ending in June" following, but, notwithstanding, there was inserted in the 1904-05 advertisement for stationery, coal and other supplies a request for sealed proposals for "also the furnishing of the new Capitol building $18.40 as his price, and supplied square and oval tables, round chairs, clothes trees, desks, a bootblack stand, andirons and umbrella tubs.

Item 28—"English laid interlocking wood and rubber flooring, per foot, $1.50."

Sanderson bid $1.27½.

Item 30—"Modeling and sculptor decorations, 'per foot,' maximum price, $100."

Sanderson bid net.

Item 32—"Designed bronze metal for gas and electric fixtures, hardware and ornamental work, mercurial gold finish, hand-tooled and rechased, 'per pound,' maximum price, $5."

Sanderson bid $4.85 "per pound," and a contract for chandeliers and other lighting fixtures was awarded to him aggregating $2,049,522.96.

Item 40—"Favrile and Baccarat glass, 'per foot,' maximum price, $30."

Sanderson bid $23.70. In its secret way, the Pennypacker Board decided on April 12th, 1904, that any proposal must cover "the entire furnishing" of the Capitol, a fact unknown to every bidder with the possible exception of Sanderson. In the legislative investigation, advocated by Governor Stuart and now in progress, prospective bidders swore that they had no conception of the extent of the contracts or the character of the articles, nor could they get specific information from Huston, the architect. Further, the "per foot" rule, whether it meant lineal, square or cubic, especially in the measurement of an oval table, a clothes tree or a bee-hive-shaped glass globe, was a mystery to manufacturers and dealers.

Evidence thus far adduced of an "understanding" between Huston and Sanderson has been contained in the sworn testimony both of sub-contractors and men familiar with the affairs of the two men. For example, a year before Governor Pennypacker's Board authorized the furnishing contracts, Huston accompanied the representative of a parquetry floor maker to "see Sanderson."

"You understood from Huston and Sanderson, did you, that Sanderson was to be the successful bidder and get the contract?" was the inquiry of James Scarlet, the attorney for the legislative probers.

"Yes," replied the witness.

Again, while furniture designs were being drawn in Huston's locked office, months before the advertisement for proposals, Sanderson not only was in the secret, but, according to sworn testimony given by one of Huston's men, actually had his own draughtsman to assist Huston's.

As to the methods by which the contracts were fulfilled, it is possible in a limited space only to give a few examples of prices for which sub-contractors did work for Sanderson, compared with Sanderson's collections from the State. These show the much-inflated prices, with profits ranging from 300 to 4,305 per cent!

Sanderson's chief contract was for electric lighting fixtures—"bronze-metal, mercurial gold finish." Anticipating the contract, Sanderson organized his own company, called the Pennsylvania Bronze Company, to manufacture the chandeliers and brackets. His brother-in-law managed it; Sanderson supplied all the money, $39,000, and capitalized it for $100,000, upon a promise given in writing to Sanderson by his brother-in-law at Sanderson's dictation that the concern would have the Capitol fixtures' contract. The company cleared $100,000 profit. It manufactured 2,000 fixtures

MAHOGANY BOOTBLACK STAND.

This stand, upon which the profit was 4,305 per cent., is eight feet long and five feet wide. It cost the main contractor, John H. Sanderson, $50. He added the two chairs, worth less than $25 apiece, and sold the outfit to the State for $1,619.20.

and sold them for $550,000 to Sanderson, who collected $1,612,572.56 from the State—a profit of $1,062,572.56.

Sanderson received $4.85 "per pound" for chandeliers; consequently, the fixtures were solidly made and had enormous weight—a fact ridiculed by reputable chandelier makers. Huston once explained seriously that the object of the great weight was to "prevent anyone from stealing the fixtures!" In the House of Representatives are four can-

delabras, each weighing 7,500 pounds! Experts have ascertained that, in some of the side brackets, at least, there is a deficiency in the weight as given in Sanderson's bills, but it has not yet been determined whether "short weight" was practised. Two frauds thus far exposed in the chandelier contract were the substitution of cheap lacquering, and some electro-plating, and for the expensive and exquisite "mercurial gold finish" demanded in the specifications, and the substitution of domestic glass for imported Baccarat. For glass manufactured in Beaver County, Pa., Sanderson collected $133,770.69 from the State at $23.70 "per foot," billing the glass as Baccarat. His total profit upon the glass was $105,000, or nearly four times its cost.

In addition, Sanderson charged the State $137,600 for working models and sketches for fixtures made by his company, altho that expense, in ordinary contracts, falls upon the contractor.

The contract standing next in money value was one for "specially designed fire-proof metal filing cases, vaults and safes." Without regard to market prices, or the prices paid by the State to the same concern the previous year, thousands of filing cases were bought at $10 and $12 "per foot" from a corporation of which Congressman H. Bird Cassel, of Lancaster County, was president. Prices in the previous year were $5 and $6 "per foot." The total amount of the Cassel contract was $2,000,000. Cases of similar pattern and material can be bought in the open market for $1.50.

Every one of the five hundred rooms of the Capitol has been smeared with brilliant colors and gilt; in the main rooms the effect tends to gaudiness and it is the exception to find it really rich. For painting and decorating, as designed by Huston, the sub-contractor received $174,962 from Sanderson, who, in turn, reached into the State Treasury for $789,473.16, or a profit of $614,511.16!

Two caucus rooms—one for the Senate and the other for the House—were furnished precisely the same. For the Senate room, Sanderson charged $88,242.97; for the House room, $117,258.40. Indicating the profits collected by Sanderson, are the rostrums in both, for which, the sub-contractor swore, he was paid only $2,060. Sanderson collected $35,114 for that in the Senate room and $55,604.80 for that in the House room —a total of $90,718.80, or 4,305 per centum profit.

Solid, carved mahogany was specified but the sub-contractor admitted that Sanderson instructed him to substitute hard putty balusters in the side rails. The same wood-worker testified of other substitutions of hard putty composition for the real mahogany, the putty being stained in imitation of the wood and sold for the same price—$18.40 "per foot!"

For designed wood-work in fourteen smaller rooms, the sub-contractor charged Sanderson $28,170. Sanderson collected $155,369.60 from the State for the wood-work, taking a profit of $127,199.60. Even in the Governor's apartments, where the highest artistic effect was attained and where genuine Flemish oak was used, Sanderson collected unusual profits upon the wood-work, being $78,108.35 more than the work cost—$16,099.65.

For two hundred and eight mahogany desks in the House of Representatives, sold to Sanderson for $78 apiece, or $16,224 in all, the contractor charged the State $18,40 "per foot," the total "feet" in two hundred and eight desks being 3,230. Sanderson's collection for the lot was $59,432, or $43,208 profit. For fifty desks in the Senate, manufactured by the same sub-contractor, the cost to Sanderson was $65 each, $3,250 for all. Sanderson figured out "1,225 feet at $18.40 per foot, $13,230," or more than 300 per centum profit.

In mahogany clothes trees, six feet high, round and four inches in diameter, with a broad base, Sanderson measured "four feet" and collected $18.40 "per foot," or $73.60 a tree. The single tree cost $12. Sanderson sold "eighty-eight feet" of an ordinary mahogany boot-black stand to the State; it occupies a place in the Senate wash-room. For building the stand, the sub-contractor charged $50. Sanderson added two chairs worth not more than $25 each and sold the combination to the State as "designed wood-work" for $1,619.20. William Russell, a reputable Philadelphia wood-carver, did much of the work for Sanderson. With eleven smaller articles,

he furnished a barber's stand costing $325; Sanderson collected $3,256.80 for it. Russell's bill for the whole dozen articles amounted to $3,535, or only $243.20 more than Sanderson collected for the barber's stand. When Russell asked for his money, Sanderson demanded that the $35 be "knocked off" his bill.

Prices for parquetry flooring, for carpets, for tapestries, for thermostats, for heating registers, for stone mantels, for everything, were inflated and, wherever possible, the specifications either were altered or ignored. For thousands of feet of parquetry flooring, costing less than a half dollar a foot, Sanderson collected $1.27½. For thermostats, of which only 257 have been found in the entire building, Sanderson collected $79 apiece. His total bill amounted to $53,167, being for "thermostats and work equal to 673 thermostats at $79!" Observe the nicety with which this man collected $79 from the Commonwealth for "work equal to a thermostat."

Fifty pairs of andirons were sold by Sanderson to the State for $73.60 a pair, at $18.40 "per foot," each andiron being "two feet." These were supposedly a "specially designed" article and Huston, the architect, received $147.20 for "designing" them. An agent of the Legislative investigating commission bought a pair of the andirons from a dealer for $23 and was told that they were a stock pattern twenty-five years old.

Sanderson's jugglery of his "per foot" rule was as puzzling to experts employed in the Capitol investigation as it was amusing to other contractors and to the taxpayers. Chairs and tables were measured in every conceivable manner in the effort to have them correspond with Sanderson's bills. Finally, in a square mahogany table of "eighty feet" the secret was discovered. The table was eight feet long, four feet wide and two and a half feet high, or of a size to occupy a box of eighty cubic feet. Sanderson collected $18.40 "per foot," or $1.472. The table cost him $40, so that he had a profit of 3,580 per centum!

So patent have been the evidences of fraud that members of the Capitol Investigation Commission recently declared that they would recommend civil action to recover $3,000,000 at least, and also criminal prosecution of certain persons. It is the opinion of experts that the trimming of the Capitol, with its lot of steel filing cases, its tens of thousands of pounds of chandeliers, and everything else, could be duplicated for $3,500,000, liberally estimated.

In addition to his commission of $184,736, which he collected for work upon the construction of the Capitol, Huston bargained for four cents upon the dollar as architect for the Pennypacker Board of Grounds and Buildings. His entire account amounted to $525,318, of which $104,686 is being withheld by State Treasurer Berry. Every pound added to the weight of chandeliers, either actually or according to Sanderson's bills, meant nineteen cents more for Huston, the architect. His most surprising commission, however, was the $80,000 he received for "designing" the $2,000,000 worth of steel filing cases and vaults. The "designing" consisted of gilt lines.

It has been ascertained recently that Huston had a most extravagant dream of a Capitol beautiful. Plans which he exhibited to friends included provision for the Capitol, a State Museum and Library, a Capitol park, with fountains and sunken gardens, surrounded by a high wall, the whole at an estimated cost of $35,000,000.

Of course, the legislative investigation has been one-sided thus far, and the defense of Huston, Sanderson and Governor Pennypacker is unknown. All have maintained that everything was done "according to law." That was the plea of ex-State Treasurer Harris, yet, when he was subjected to a three hours' grilling by Attorney Scarlet, he used these words:

> "It (a provision of law) was ignored simply because it was impracticable. It wasn't possible. We did not strictly comply with the act; we followed custom.
>
> "I'll say frankly that I have been greatly fooled. I had no anticipation that the people were to be defrauded in the way they have been. I never received a red cent in connection with it. I am innocent. I am frank to say it is an outrage."

Huston has not been called as a witness in the legislative inquiry, but, with the first revelations, he issued an explanatory letter defending his course. In it he said:

"The cost of the Capitol furnishings exceeded my expectations and those of the members of the board. But wherever the money has been expended it was in accordance with the law and in the only manner permitted by law.

"As a result of it all the State has got, by actual comparison, the cheapest, biggest and best building of its kind in the country, or in the world."

Since Huston's letter, the more startling disclosures have been made, and it has been impossible for newspaper reporters to find him. Sanderson quit Philadelphia, and, according to report, has been living in New York for several months.

Interest attaches to the excuse which ex-Governor Pennypacker will give for his part in the Capitol scandal. Until ex-Treasurer Harris admitted violations of the law, the ex-Governor, too, insisted that everything had been done in "accordance with the law." In all his public life, as a judge and as Governor, there never has been the whisper of a suspicion against his probity. Sentimental and vain he is, and it is the honest opinion of men who know him that he was reached by flattery.

In connection with the disclosures, the persistent question is, Where did the money go? In view of the fact that the bulk of the payments for furnishings was made between State Treasurer Berry's election in November, 1905, and his induction into office six months later, some have thought that the profits were in part fictitious, and that the bills were inflated to account for money alleged to have been "borrowed" from the treasury by political interests. Emphatic denial was given to this, however, by State Senator John S. Fisher, chairman of the Capitol Investigation Commission.

Opinions differ as to the architectural beauty of the Pennsylvania Capitol—whether there is "richness of design" or mere gaudiness in paint and gilt. However, there is no question that the Capitol is a fraud, whether "according to law" or not. Ex-Treasurer Harris defined the fact precisely when he declared:

"It is an outrage."

PHILADELPHIA, PA.

PENNYPACKER AND QUAY IN BRONZE.

Side by side the head of Pennsylvania's greatest political boss, Quay, and that of his eulogist, Pennypacker, are fixed upon the front doors of the State Capitol.

MAY THIRTIETH

By RICHARD H. PLATT

Flags are flying,
Drums are beating,
Carnage ended,
the battle done.
Foes are dying,
Foes retreating,
Heroes splendid
have fought and won.

Fireflies dancing,
Stars dim-shining,
Warfare ended,
they slumber well;
Cause enhancing,
Cause declining,
Heroes splendid,
they fought and fell.

Homeward faring,
Spent and grieving,
Striving ended,
they count the cost:
Danger daring,
Fame achieving,
Heroes splendid
have fought and lost.

Victors quiring,
Vanquished pining,
Slain unheeding
beneath the pall,
Cause aspiring,
Cause declining,
Truth was needing
them, one and all.

Sonoma, Cal.

The Unseasonable Spring of 1907

BY ALFRED J. HENRY

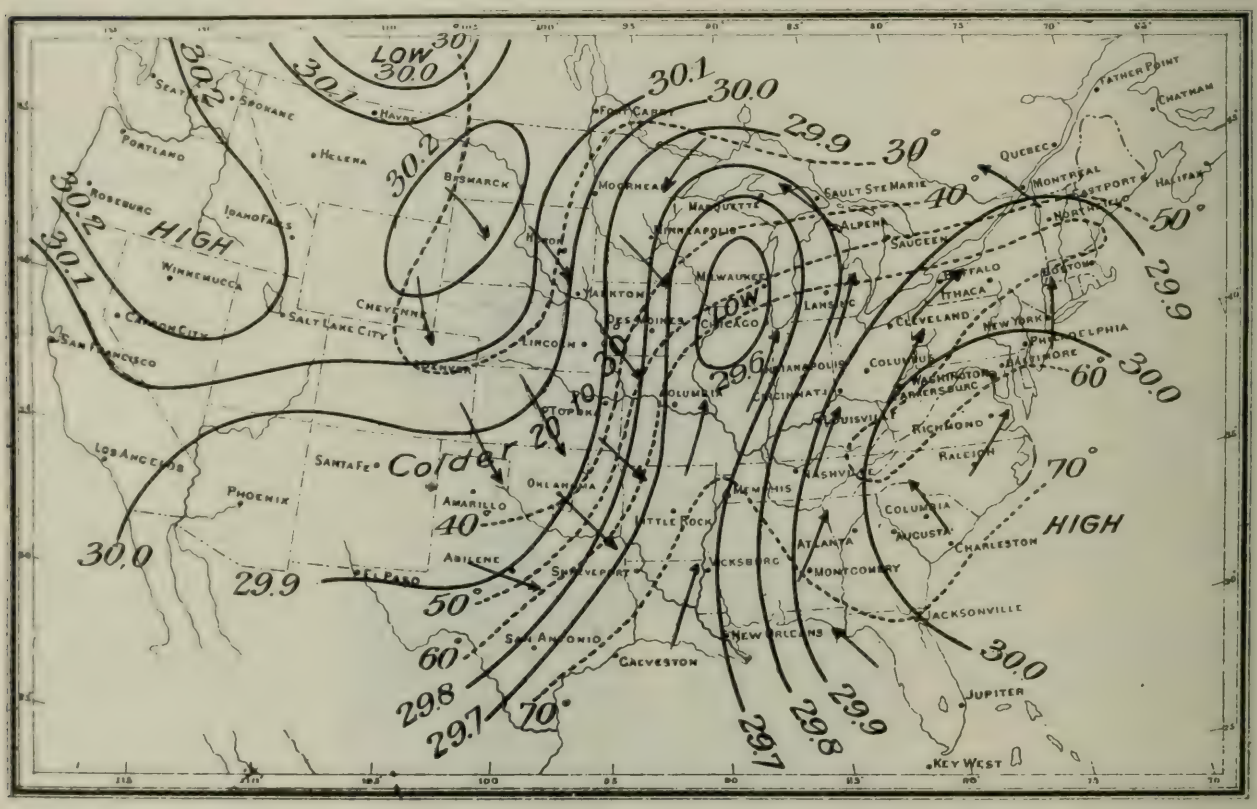
PROFESSOR OF METEOROLOGY, UNITED STATES WEATHER BUREAU.

THAT the present remarkable spell of weather has not yet past into history is evidenced by reports received at the Washington Weather Bureau Office this morning (May 14th, 1907). These show that in the central Rocky Mountain region snow was falling with temperatures below freezing; in the Dakotas and over the greater portion of Nebraska the temperature was at the freezing point or below, with here and there a light snow covering left over from the fall of the previous day. The snow, fortunately, will do more good than harm, since as it melts it will add to the store of moisture in the ground. The question which excites the interest of the general public, however, is, When will the wintry weather cease? Will this be another year without a summer, as in 1816?

ALFRED J. HENRY.

The present spell of unseasonable weather began nearly sixty days ago, when early spring borrowed a number of days from midsummer. To those who are accustomed to noting the eccentricities of the weather from day to day, the most remarkable thing about the change was the ease and rapidity with which it was accomplished. Suddenly, without any preliminaries to speak of, we were in the midst of summer. In the transformation no rule of nature was violated, no physical principle was set at naught; yet it seemed marvelous that such things should happen.

A clear conception of the general movements of the atmosphere in winter and summer will, perhaps, be helpful in reaching a better understanding of the underlying causes of weather than is now enjoyed. It will also aid very materially in brushing away some of the mystery that many persons persistently attach to the action of the elements. The best and simplest method of attacking the problem is to study the winds. Begin with a study of their qualities and the apparent effectiveness of each wind in producing rain or snow. Thus it wil be found for the Middle Atlantic States that westerly winds bring fair weather, easterly winds cloudy and rainy weather. As to temperature, all north and northwest winds in this hemisphere may be classed as cold and all southerly winds as warm.



Winds are caused by differences in temperature, whether such differences are merely temporary and local, or worldwide in extent, such as exists be-

tween the equatorial and polar regions. In a general way the great wind systems of the globe are produced by the temperature differences between the equator and the poles. In equatorial regions, for reasons which need not be stated here, the temperature is very high compared with that of polar regions. The air being greatly heated rises to great altitudes, and there is a tendency for the upper air to flow from equatorial regions poleward in both hemispheres, with a counter current in the lower air from the poles toward the equator. The winds caused by this interchanging motion between the equator and the poles are modified by the deflecting force of the earth's rotation and the pressure distribution on the different parallels of latitude, so that there results a rather complex system of winds. As the angular altitude of the sun increases, the southerly winds push farther and farther northward. In autumn the northerly winds begin a migration toward the equator, and they reach their farthest southing in mid-winter.

In winter the contrast in temperature between the poles and the equator is greatest, and as a consequence the movement of the air masses is much accelerated, and the conflict, so to speak, between equatorial and polar winds is greatest. The conflict really begins in the middle latitudes in the late fall, when the prevailing southerly winds are frequently interrupted by sharp northwest winds, bringing down from northern regions masses of cold air that underrun the prevailing winds, and change the entire aspect of the weather. The cold, however, is not continuous; in a day or so the air loses its frigid qualities, particles of cloud appear in the sky, interrupting somewhat the incoming solar radiation and lowering the outgoing radiation from the earth, particularly at night. The winds go to an easterly quarter, then to the south and the temperature rises. This sequence of changes is generally followed by rain or snow, and the latter by a fresh incursion of northerly winds. The cycle of changes thus described continues during the cold season, the polar winds grad-

U. S. DEPARTMENT OF AGRICULTURE. WEATHER BUREAU.

Weather Map, May 14, 1907. 8 a. m.

Isobars in full lines, isotherms in dotted lines. Arrows fly with the wind.

ually penetrating farther and farther southward until about mid-winter, when southerly winds increase in strength, assume the initiative under the influence of solar radiation, and stream northward for a day or so, only to be beaten back by the cold northerly winds from the frozen surface of the interior of the continent. It is during the transition months of March and April that this interplay between the two opposing winds reaches its greatest development. The battle ground over which the contest is waged is mainly on the great plains of the Western States and in the Missouri Valley. Here it is that great contrasts in temperature between the two opposing winds are found; thus on March 19th of the present year the temperature in Northwest Texas and Oklahoma was 84 degrees as a result of continued southerly winds. To the northward about 400 miles, on the border of the region of northerly winds, the temperature sank to 36 degrees; still farther poleward, as in Northern Minnesota, it was 20 degrees colder, so that between that point and Oklahoma there was a difference of 68 degrees in temperature.

The daily weather map of May 14th, 1907, is here reproduced as an illustration of that particular form or type of weather which causes a wave of low temperatures to pass across the country from west to east. In this map the continuous black lines are isobars (lines of equal barometric pressure), the dotted lines are isotherms (lines of equal temperature), and the arrows fly with the wind. For the sake of simplicity the areas of precipitation and cloudiness are not shown, and the isotherms have not been drawn west of the Rocky Mountains.

The essentials of the map are contained in the three following things, named in the order of their importance: (1) the wind circulation, (2) the temperature lines or isotherms, and (3) the form of the barometer lines.

East of the Rocky Mountains the wind circulation is divided into two main branches, viz., the southerly winds, that prevail east of the Mississippi and south of the Ohio, and the northwest winds, that prevail from the Rocky Mountains to the Mississippi. In addition to the foregoing there is a distinct circulation of the wind, to which special attention is invited, spirally inward around the area of low barometer in a direction contrary to the movement of the hands of a watch.

The discovery of the fact that the wind always circulates around an area of low barometer, as here exemplified, marks a most important epoch in meteorological science. The effect of the wind circulation on the temperature is clearly shown by noting the course of the isotherms; thus it will be seen that the western extremity of the line of 60 degrees starting in Southern Texas, N. latitude 27 degrees, runs northeastward, crossing Lake Michigan north of Chicago, thence east-northeast to the New England coast, N. latitude 42 degrees, whence it changes its course to the southwest and proceeds in that direction as far as the mountain region of North Carolina and Virginia, and then northeastward to the Atlantic Ocean off the Maryland coast. In other words, starting at N. latitude 27 degrees one could pass northeastward over 15 degrees of latitude without experiencing any colder weather, whereas under normal conditions it is 20 degrees colder in Southern New England than in Southern Texas.

In the region of southerly winds on the date under consideration, the temperature is elevated above the average for the season; in the region of northwest winds it is depressed as much as 20 to 30 degrees below the seasonal average, thus forming a great sheet of cold air covering an area of at least half a million square miles. Opposed to this in the region of southerly winds is an equally great mass of warm air. The energy of solar radiation, while it tends to raise the temperature of the cold air, also maintains the existing high temperatures in the region of southerly winds, hence the two sheets of air—the one warm, the other cold—move eastward in the general drift of the atmosphere and finally pass off the Atlantic Coast to the ocean. In winter the cold air moves eastward with the greater portion of its original frigidity; as spring merges into summer, however, much of the original cold is lost, since the energy of solar radiation is then greater and the eastward drift of the atmosphere slower. Consequently, by the time the original mass of cold air reaches eastern districts

it is apt to be broken up into smaller portions or patches, each of which is less effective than was its corresponding mass in the original.

The weather that is experienced from day to day is the result of the development and movement of systems of circulating winds, in which relatively warm southerly winds are followed by colder northerly winds. The first named are productive of precipitation, the last named are favorable for fair weather. The development of these systems of whirling winds is irregular and their movement is uncertain. If they should develop in the southern part of the United States or move to that part of the country from the northern Rocky Mountain region, the opportunity for an unobstructed flow of northerly winds is afforded.

It is obvious that the character of a season, whether warm or cold, depends upon the prevailing winds. If these are from a northerly quarter, as is the case when the center of the opposing wind systems is in the south, then the season will be cold and backward.

Too much importance cannot be placed upon the point that the control of the weather rests chiefly upon the development and movement of these migratory systems of opposing winds; it was to one of these that the warm weather of March last was due. The warm weather thus inaugurated, however, was followed by the drift of masses of cold air from the Northwest, and these have followed each other so fast that the temperature has not had time enough to recover from one onslaught of cold before another was upon it. The reason for the long continued drift of cold air from the Northwest is not known; so far as human experience in such matter goes, it has about reached its limit, and will speedily come to a close, or at least the cold will be so diminished as to be harmless in its effect on vegetation.

WASHINGTON, D. C.

The Religious Situation in the Philippines

BY THE MOST REV. J. J. HARTY

[Archbishop Harty was appointed three years ago to be Archbishop of Manila, and has now returned to America for a visit of a few months, much of which he is spending in his home parish of St. Leo's, in St. Louis. This article was obtained as an interview.—EDITOR.]

A TRAIT of Filipino character, which should come first in describing the people, is the deep respect felt by the child for the parent. The Filipino grows from youth to manhood, marries and has a family, but he never gets away from the influence of his own father and his own mother. If he wishes to take up any matter of moment, his first counselors are his father and mother. In traveling thru the islands I have frequently encountered young men—bright young men from good families—and after the usual civilities I have often said, "What career do you propose to follow in life?" Invariably the answer has been, "I must consult my father before I can give you a reply." At the root of this beautiful characteristic of the Filipino race is the tendency to be obedient to authority. They recognize without question the authority of God, of the parent, of the priest, and of the State.

This trait, which I take to be the most important feature of the Filipino character, is the result thru all the years of the work of the missionaries, those men who not only had a knowledge of physics, philosophy and theology, but were also architects and builders, advance agents of civilization. They designed the churches, built the bridges, constructed the roads. At the present time in the Philippines you may see great irrigating works which were constructed 200 years ago to irrigate arid sections of the country. The missionaries intro-

duced the mulberry and the indigo plant, and it was they who brought the domestic animals to the islands.

The old men of the religious orders, now returned to Spain and living in retirement, I visited in their monasteries on my way to America. Many of them had spent from twenty to forty years in the Philippines, and one aged father had been working fifty-three years in the islands. In one religious house in Barcelona there are thirty-seven of these retired missionary priests. I spent three days among them, and the pathos of their appeals to be taken back to the islands to resume the work which they had formerly done moved me very deeply. But their time for work had passed, because the average age of these missionaries is seventy-five years. Their devotion to the spiritual needs of those to whom they had ministered was beautiful. Their questions were, Are the people attending the services of the Church? Are their children being baptized? Are they receiving proper instruction? What kind of lives are they living? Material conditions were seldom alluded to. They forgot these in their zeal for the souls of of the people.

ARCHBISHOP J. J. HARTY.

I was touched by the cordiality with which these religious in Spain received me. A joint letter expressing their loyalty was sent to me, upon my arrival in Spain, from all the old missionaries, altho I was an entire stranger to them and had only the claim of the faith and of being a Bishop from the Philippine Islands. I had the entrée to their hearts. In my conversations with them, they spoke of the United States with such kindness as surprised me. They draw a very strong line between Americans in general and the politics which they hold responsible for sending them away, but for America and the Americans they have great admiration.

In the diocese of Manila I have administered 300,000 confirmations in the three years that I have been there. In explanation of this number must be considered the facts that confirmation had not been administered in the country districts for many years before my arrival, and that it is the custom among the Filipinos to confirm children very young, even in their infancy. But if you remember the number of people in the islands, and the size of the families—averaging seven persons—300,000 is not so many to be confirmed in one diocese of 2,000,000 in three years' time. The people brought their children from far and near, and more than once in one church I administered confirmation from early morning till late at night. The Fili-

pinos are very zealous about enrolling their children in the Church. Usually the day of the birth of a child is the day of its baptism. This can be done without injury to health, as the climate is so temperate that no evil effects follow from exposure.

A custom instituted by the missionaries is the ecclesiastical census of the Philippines. Each child that is baptized and confirmed is provided with a cedula, on which appear the name of the child and the names of its parents. These cedulæ are kept in the chancery offices, a perfect system of registration, and in the archives also is preserved a record of the baptisms and of the burials. Thus we have the names of 7,000,000 Christians now in the archipelago.

The more I know of these people the more I love them; and the more I know of their past history the greater is my wonder and admiration now at the heroic labors of the ancient missionaries, now at the wonderful correspondence of the people with these labors and their extraordinary advance from savagery and even cannibalism to a civilization as widespread thru the islands as ours thruout our country. Hence it is that the more convinced I am that, just as in the past (even so far back as one hundred and fifty years ago, before they were disorganized by civil war and corrupted by its anarchy), the natives made excellent priests and bishops, and were the means, under the European missionaries, of converting the islands, so, too, in time to come, when the effects of these demoralizing influences shall have past away, this people, united by the faith, the sole unifying influence among them, will be found to have fitted themselves to stand alone on a very high plane of civilization. Even now many of their churches and other public edifices would honor any American city. The standard of the learned professions, manned by natives mostly, is very high. The University of Manila was a university many years before our country had any worthy of the name. This university now, in spite of the upheaval of the revolution and the civil war, is officered mainly by natives, and has 900 students of law, medicine, pharmacy and all the university branches.

The people are as good as they are bright and clever. The women are remarkably pure. The men, young and old, possess remarkable self-control. Only those who have lived in the East can realize what this means. Such of the church edifices as we have priests for cannot hold the people who wish to attend divine service. This is why we need outside clergy and must continue to need them until the native clergy whom we are preparing are ready.

In the seminary which I have established at Manila for the education of young Filipinos for the ministry, a twelve-year course is arranged, under the nine Jesuit fathers who form the faculty. Methods of agriculture—the best ways of treating the soil, the character of the soil, the value of seeds and kindred subjects—form a special department of instruction, added to the classical course and the courses in physics, philosophy, theology and Scripture which we offer.

There are 206 students in the seminary. I find vocations abundant, and if I had the means I could have 1,000 young men studying for the priesthood. But we can support only a limited number. At the present time 30 of these young men are able to pay their own expenses. The balance are wards of the Church, because their families have become impoverished. I have selected them with reference to their families, to their physical equipment, to their mental capacity, and lastly, a consideration which is most important of all, with reference to their inclination to the priesthood.

For the general education of the children, the system in vogue in many places is attendance at the public school for one-half a day, and for the other half at the Catholic schools, where lay teachers give instruction under the direction of the priest. The stronger churches have parish schools. At one time all had them, but the revolution caused the destruction of many.

The Filipino has an affection for the place in which he worships. A person going to pray would give you the impression that he is going to have a personal audience with God. Childlike and trusting, he regards the church as his own house, because it is the house of his Father, and he acts as if he had the title deed for it in his own pocket. The chil-

dren clamber around in the churches just as if they were in their own homes. No chairs are provided except for the old and feeble and for persons of distinction, such as the civil governors of the islands. The people kneel or stand during the services. The sermons are brief, the entire service rarely lasting more than an hour and a quarter.

In journeying thru the islands I find the people desirous that the full ritual of the Church shall be observed. Congregational singing is in vogue, and the congregation sings the entire service, as a rule, particularly in the country places. Every parish has an orchestra, sometimes numbering sixty instruments, and many of the great masses are sung by the people, accompanied with this orchestral music.

The idea that the Church in the Philippines is rich is pure fiction. The Church had been rich in lands, and these lands were productive and gave results, but for ten years no revenue has been received from any of them, and the result is poverty on the part of the Church. Under the old *régime* the Spanish Government paid for the support of the clergy. This, of course, has been withdrawn, and the clergy are dependent on the voluntary contributions of the people. The people had not been accustomed to support the clergy directly; they supported them indirectly thru the taxation system. The direct contributions are now a hardship to them, the support which they give to the Church is very meager, and the priests are in extreme poverty.

There are 400 priests in the diocese of Manila; 120 priests in the diocese of Jaro; 110 in the diocese of Vigan; 250 in the diocese of Cebu, and 160 in the diocese of Nueva Caceres. In the United States we have 14,000,000 Catholics, with 14 archbishops, 90 bishops and 15,000 priests. In the Philippine Islands we have 7,000,000 Catholics, just 50 per cent. of those in America, and we have 1 archbishop, 5 bishops and 1,040 priests. The striking contrast in these figures shows without comment how much remains to be done.

At the outset, our Government was egregiously deceived as to the position and state of the Church, but it has learned in time, I hope and think, that the anti-Catholic forces were not only anti-Spanish and anti-American and anti-white men but also anti-social and anarchical. These forces were never numerous, but they were united, determined and aggressive. The identical methods of the French Reign of Terror were used to coerce the immense majority of the people, who were then and are now pious and devoted Catholics; industrious, law-abiding citizens, excellent parents anxious to give their children every opportunity of advancement and especially of education; and all of them —every one who has anything to lose, whether in property or in family—are very friendly to the United States. This devotion to our flag is mainly due to the prudence of Taft, and to the excellent general conduct of the American army officers and men. The sacking and pillaging of the churches which so disgraced our arms in the beginning was mainly the work of one volunteer regiment.

The natural riches of the islands, agricultural and mineral, are extraordinarily great. The soil is among the best even in the wonderfully fertile Orient. Even under the present primitive methods, a mere scratching of the surface, it yields two or three crops and will grow anything. Yet scarcely one-tenth of it has yet been touched. The climate during eight months of the year is simply ideal, and altho during the remaining four it will average above 96 degrees in the shade, it causes no great inconvenience to the ordinarily prudent man who is normally clean, morally and physically. The ordinary diseases of children, common in America, are almost unknown there. There is no reason in the world why these Islands should not greatly benefit us and we them financially and politically, to the great advancement of civilization in the East and of our common humanity thruout the world. Let our Government gain the affections of these 7,000,000 Catholics in the very heart of the pagan East, and they will become the most efficient pioneers of what is best in Western civilization, and a means of immensely increasing our influence with those two extraordinary peoples to whom they are so near akin, the people of China and Japan.

ST. LOUIS, MO.

A Portrait of the Empress Eugenie

An interesting portrait of the ex-Empress Eugenie, who completed her eightieth year on May 5th, has just been discovered at Chambéry, in Savoy. M. Auguste Filsnoël, a well-known lithographer of that town, while rummaging in an old garret found a full-length portrait of Eugenie, which was all crumpled up in one corner. It was a gift to the municipality, made in 1860, soon after the annexation of Savoy to France. The black hair and blue eyes give to the physiognomy a remarkable beauty, and, tho somewhat damaged, experts consider it not only a very fine likeness, but a notable piece of artistic work. So far, it has not been possible to learn who was the painter. When the Second Empire fell, on September 4, 1870, the mob invaded the city hall of Chambéry, tore down this canvas and another representing the Emperor Napoleon III, burnt the latter in the public square and dragged the former thru the streets of the town. How it finally found its way into the garret, where M. Filsnoël found it, is also unknown.

Will Women Ever Dress Like Men?

BY HENRY T. FINCK

Author of "Romantic Love and Personal Beauty," "Primitive Love and Love Stories," Etc.

A FEW years ago a Kentucky judge ruled that if a woman wore a man's hat she must take it off in his court. This aroused the ire of a pugnacious journalist of the fair sex. "What," she asked, "constitutes a woman's hat? Nothing but ownership. If a woman pays for a hat it is hers. Nobody has the least authority to say what kind of a hat a woman shall wear so long as her headgear does not infringe on anybody else's rights."

Suppose a man were to walk down Broadway wearing a woman's hat adorned with flowers or waving ostrich feathers. He would probably be arrested for collecting a mob, or on suspicion of insanity or degeneracy; yet might he not exclaim, with the same indignation as the woman just cited, that since he had paid for that hat it was his, and that nobody had the least authority to say what kind of a hat a man shall wear? Are not these sexual lines of demarcation in dress a mere matter of convention anyway? Do not the women in some parts of the earth wear trousers, the men skirts? May not the time come when woman's—dress will be as plain as man's, or man's as ornamental as woman's—the time, in short, when women will dress just like men?

If such a time should ever come, it would be simply a case of history repeating itself. There have been periods and countries in which the women wore the same garments as the men, and there have even been times when men were the brightly ornamented sex while women were plainly attired, just as among birds the males alone have the beautifully colored plumage, while the females have to content themselves with dull, gray feathers. Indeed, this state of affairs, which to us seems so topsy-turvy, has prevailed among the lower races of mankind in general. While the American or African chiefs or medicine men would strut about adorned like peacocks, their wives were obliged to content themselves with a string of beads or a few other baubles, or nothing at all in the way of adornment.

How are we to interpret this strange state of affairs? Inasmuch as it is the rule among animals—particularly birds—and the lower races of mankind, for the males to be more beautifully attired than the females, must we not infer that this is the normal, natural condition, from which we have unwarrantedly strayed in making man the plain, woman the ornamented sex? In other words, do not natural history and anthropology suggest the conclusion that in the future, women will once more be, as in the good old times, plainly attired drudges—*mutatis mutandis*—wearing derby hats, business coats, and trousers, while the men will strut about in ostrich-feather hats and gay silk skirts?

To solve this interesting problem we must first ascertain how it happened that both among animals and the lower races of mankind the females are less decorated than the males. The answer can be most concisely given with reference to birds. Female birds are without the brightly colored feathers peculiar to their species for the simple reason that in the struggle for existence dull feathers are necessary to protect them in their nests from the eagle eyes of enemies. Nor is the explanation less simple in the case of primitive women: they are usually unadorned because the men have so little sense of beauty or justice that they do not allow or encourage them to decorate their bodies. But why do these savage men decorate their own bodies? In order to make themselves look beautiful? Such a thought never enters their heads. When Lewis and Clarke found the Dakotas dressed in robes of buffalo skins adorned with painted porcupine quills, they were shrewd enough to find out that these quills were not ornaments, in our sense of the word, but "emblems of military exploits or any other incident." Many other explorers, in various parts

of the world, were less sagacious; seeing the natives "adorned" with the horns, teeth, feathers, claws of animals, or with pieces of wood or metal, or fantastic seeds of plants, they concluded that these "decorations" were evidence of the strange "sense of beauty" and "ideas of dress" of these natives; whereas, in truth, they had nothing whatever to do with either esthetics or dress. Most of them were used for superstitious, medical, talismanic, magical, purposes: as a charm against snakes, tigers, or human enemies; as a safeguard against sorcery, to insure luck in the chase or fishing; and a thousand other things. Shells are often worn as we carry money—to serve as a medium of exchange. Feathers and other things are worn to indicate acts of courage or success in war. Forbes says regarding the Dahomans that "according to rank and wealth anklets and armlets of all metals and necklaces of glass, coral and Popae beads, are worn by both sexes," and what is true of them is true in general; it is *to indicate rank and wealth* that the chief men in a tribe "adorn" themselves with fine furs and feathers, with the claws and teeth of beasts of prey, and so on. These are the product of the chase, in which men alone indulge; and as the hunters are selfish and keep such trophies to themselves, we have here the clear and simple answer to the question why among the lower races the males are more gaudily attired than the females.

Nor is there much change in the situation if we pass on to countries or epochs where the man who uses fine raiment is civilized. The Chinese mandarin, who wears gorgeously colored silk gowns, doubtless has a more developed sense of beauty than the Polynesian chief, who struts about in a cloak made of birds-of-paradise feathers; yet in the one case, as in the other, the main object of the gaudy, costly attire is to indicate the rank and wealth and power of these individuals and thus to distinguish them from ordinary mortals. In England, in Chaucer's time, men of rank and fashion had one leg a blaze of crimson, the other tricked out in green, blue or yellow. In the reign of Henry VII dandies wore sleeves that almost reached to the ground. As late as the middle of the eighteenth century a dandy would appear in a vivid green coat, a waistcoat of scarlet, yellow breeches and blue stockings. Were such things worn for beauty's sake? Heaven forfend! They were worn for exactly the same reason that barbarian chiefs wore their finery: to proclaim to ordinary mortals, "I am a noble," or "I am rich," and thus to ensure the deference usually given to aristocracy and wealth.

It was not till the end of the eighteenth century that a reaction set in against this masculine finery and foppery; and while there have been relapses now and then, men have come to realize more and more that they were intended to be the useful sex, plain and unadorned. In Asia one may still see—as in Tibet—dignitaries wearing hats trimmed with feathers, as well as bracelets, armlets, swords ornamented with corals and rubies; but in Europe and America a man conspicuously given to finery is now a rare exception, apt to be regarded by most other men as effeminate.

More and more is utility becoming the umpire that shapes the garments of men. The evening dress, with all its ugly features, is retained, as we all know, for the reason that it makes it possible for a man to appear at any social function, in any part of the world, at any time of the year, without further thought as to his appearance. It is this usefulness that has saved it, and will save it, from all assaults by tailors and arbiters of fashion, tho they may have a Prince of Wales for their leader. To allow a serious change to be made in cut or color would open the way to sartorial license and chaos, compelling man, by and by, to have as many new garments as his wife has; and that he will never tolerate in his modern mood.

A striking illustration of the trend from the ornamental to the useful in masculine attire in our day may be found in recent radical changes in army uniforms. Military men used to be arrayed like Chinese pheasants or mandarins; a description of all the varieties of uniforms and the incessant changes of fashion in them fills as many volumes, and calls for as many gaudily colored plates, as a history of woman's gowns and head gear. But all this splendor is fast disappearing. Commenting on General Funston's recent recommendation

that the dress chapeau and epaulets for general officers be abolished, an expert remarked that "the tendency thruout the military establishments is toward less fancy and less ornate dressing, in service and dress uniforms, and the time is not far distant when the wonderful sartorial creations once used to hide the soldier's nakedness will live only in secret societies and old prints."

One of the Russian Emperors is said to have been averse to war because it ruined the beautiful uniforms of his soldiers! In some countries the esthetic standpoint is still maintained in the military establishments; but the most up-to-date rulers have abolished it, or are fast abolishing it. Strange to say, it is only within the last decade that military men have fully realized the very great value of the suggestion made by Chevreul, as long ago as 1839, that there were occasions when somber colored uniforms were of advantage, to conceal the soldiers from the enemy's gaze. In the late war with Japan one of the many disadvantages under which the Russians labored was that their officers, in their white coats, made splendid targets for the enemy's rifles, whereas the Japanese officers were dressed as plainly as the privates and so as to be indistinguishable from them at a distance. At the siege of Port Arthur the attackers wore brown caps, sweaters and overalls, so that their uniforms might not show against the brown of the soil.

During the war in China the German officers made the experiment of clothing different sections of soldiers in canvas, khaki, gray, dark blue and dark gray. It was found that khaki and canvas make the best field uniforms, as being least distinguishable from the backgrounds. For the United States Army a board spent several months trying to find the color which would make the men least conspicuous to the enemy's sharpshooters. The result was the discarding of the army blue in favor of the olive drab, in which our soldiers are now arrayed, even when they parade. It makes them less beautiful to behold, but soldiers, like all other men, were primarily meant to be useful, not beautiful.

Every step thus taken by men away from beautiful attire in all phases of his activity, has diminished the chances that women will follow them. Beautiful dress is woman's natural element, to which she took as a duck takes to water as soon as she was allowed to follow her instincts. That she was not always allowed to do this by the selfish, vainglorious man who bossed her, we have already seen. Nor was there much occasion for the use of finery as long as women were treated as beasts of burden. In tropical regions all dress was reduced to a minimum, for climatic reasons. In the North, the garments were also shaped by utilitarian considerations. Here, the bitter cold made it necessary for both men and women to wear a second skin, as it were—a garment made of furs, and tightly fitting the trunk and all the limbs. Glance at any illustrated book on the Eskimos and you will see that the women wear trousers and other close-fitting garments, just like those of the men, so that it is difficult to tell the sexes apart. Inasmuch as the Eskimo women do much of the hard outdoor work which in a higher stage of civilization would be reserved for the men, it is natural enough that they should wear this dress, including the trousers, which we have come to look upon as the distinctively masculine garment.

It is in woman's attitude toward trousers that we shall find the most convincing answer to the question whether in the future she is likely to dress like men. Today, the Eskimo women are by no means the only ones who wear the bifurcated garment. Feminine trousers survive in many conservative Oriental countries—in Persia, Arabia, Turkey, China, India, Algiers, Tunis; they may even be seen here and there in Europe. Some of the Alpine dairymaids and harvesters of Switzerland and the Tyrol wear trousers, as do the women who toil in the mines of Belgium, and the Russian women engaged in the caviare business. In Paris one may come across female teamsters, or masons, or other laborers, and in such cases the police do not strictly enforce the law against women disguised as men. According to an English journal "women are employed on the gardening staff at Kew Gardens on condition that they work in male attire"; which suggests the question on which everything hinges. Is it likely that now that European and American women are

more and more given to invading what have long been regarded as man's special spheres of activity, they will ere long follow the example of their Oriental sisters, and the Eskimos, and the Phrygian Amazons who, thousands of years ago, already wore trousers, as we know from battle scenes on some of the oldest Greek vases and sculptural works?

If we may judge the future by the past we may answer "No" to that question with an assurance bordering on mathematical certainty. Many attempts to make the bifurcated garment a part of woman's visible attire were made in the last century, and all failed lamentably. The first was that of a group of about a hundred woman suffragists who, in 1851 to 1852, adopted a costume consisting of "a short skirt and a pair of Turkish trousers gathered at the ankle or hanging straight." These trousers came to be known as bloomers, after Mrs. Amelia Bloomer; not because she wore them first but because she edited the *Lily*, in which the adoption of this garment was urged, together with other "reforms." Mrs. Ida Husted Harper tells us in her entertaining "Life of the Late Susan B. Anthony," that it was much to Mrs. Bloomer's grief that her name was thus used. An attempt to change the name to "the American costume" naturally enough failed. Americans would have none of it. Even the men who sided with the suffragists in other things—among them Garrison, Phillips, Channing, May—were bitterly opposed to the new costume and tried by every argument in their power to dissuade their friends from wearing it. As for the public at large, it raised an outcry against the bloomers that extended from one end of the country to the other. Mobs followed the wearers of them in the streets. "Their husbands and children refused to be seen with them in public, and they were wholly ostracized by other women."

Why this extraordinary opposition to the "reform" garment? Evidently the people felt instinctively that an attempt was being made to upset a law of social evolution which had ordained that woman should be the ornate sex. They discovered that these bloomered women had adopted their new-fangled garment not merely for utilitarian reasons but with an obvious bias against personal beauty, which was further manifested by the cutting off of their hair "in order to be entirely relieved from the care of personal adornment," as they frankly admitted.

It did not take the bloomerites long to realize their mistake. Within a year all of them had retreated within more becoming vestments. Their war on beautiful feminine attire had greatly damaged the whole suffrage movement, and they never forgot that lesson. When, about fifteen years ago, the subject of once more advocating the use of bloomers was agitated at a National Council of Women in Washington, a correspondent of the New York *Sun* wrote that "Susan B. Anthony was opposed to it. She said that every radical movement to introduce a new garb for women had failed, and advised us to let the business of woman's dress alone. She told us of an attempt made about forty years ago to introduce some kind of reform dress, which nearly capsized the entire movement."

No less emphatically was the "new garb for women" repudiated at a more recent convention of the suffragists; their newspaper correspondents took special pains to describe the beautiful and genuinely feminine gowns worn by the orators! The last nail in the coffin of the bifurcated garment was driven in about a year ago by one of the present leaders, Mrs. Charlotte Perkins Stetson Gilman, who wrote an article in THE INDEPENDENT in which she spoke of trousers with such withering scorn that the reader almost felt sorry for them. Clearly, women will never dress like men; for if even the suffragists, who want to make women resemble men in every possible way, repudiate trousers, there is no danger that the other women will adopt them. Mary Walker has had no followers.

Be it distinctly understood, however, that the objection to bifurcated attire of any kind on women is only to the visible garment. The bloomerites were quite right in objecting to the "heavy, quilted and stiffly starched petticoats, five or six worn at one time." These were, no doubt, horribly inconvenient, and modern woman has wisely adopted bloomers as a reform undergarment, which not only facilitates easy and graceful walking, but allows the skirt to hang more artistic-

ally. Mrs. Jenness Miller does not believe that "there will ever be such a thing as a special costume for business women." The skirt, in any case, will remain, and I do not hesitate to assert that the question which so frequently presents itself today, whether this or that kind of work is suitable for woman, can in most cases be decided by asking: "Can it be done successfully in skirts?" The same principle applies to the sports of the future, at least such as are to be witnessed by men.

When the bicycle craze swept the land it was confidently predicted by many that it would remove the ban from visible bloomers. As a matter of fact, the ugly bloomers did more than anything else to hasten the end of that craze, so far as women were concerned. Where women are among themselves, as in the gymnasium, bloomers are permissible. There are even occasions when they may be reluctantly worn in the presence of men, as in mountain climbing; but here men's trousers are preferable as being less hideous. In any case, every woman with the adorable feminine instinct of showing herself to the best advantage will hasten to get back into her skirts.

The skirt is, and will remain, the feminine garment *par excellence,* as trousers are the masculine garb. It took the world some time to find this out; it is one of the points on which even the ancient Greeks were in the dark. With them, the feminine skirt was the basis of the attire for both sexes, the himation, or plait, being the principal article of apparel of both men and women, as its equivalent, the toga, was in Rome. Since both the Greeks and Romans had slaves to do their hard work for them, there was no need of trousers—except in the army. It is surprising that the Greek soldiers did not adopt the trousers worn by the Phrygian Amazons pictured on their old vases. The Romans were more practical. When they encountered their northern trousered foes in Gaul and Britain they were not slow in adopting their style of garment. But it was not till the thirteenth century that European men generally wore trousers. Even now there are quaint survivals of the old styles, in Greece, Spain and elsewhere; in Albania there are brigands who, in their short skirts, look a good deal like our grand-opera ballet girls. The Scotch Highlanders also still wear their funny, old-fashioned kilts. In clerical and juristic life, and on ceremonial occasions at our universities, men are still to be seen in attire of the skirt type. In London, to this day, the Lord Chief Justice walks to Westminster Abbey followed by a lackey who carries the trail of his robe. But all these things are—like trousered women—curiosities, survivals of the past in which the sexual differentiation of dress had not yet assumed the aspect of a law of nature.

Perhaps the editor of *The London Tailor* was too reckless when he wrote that we have come to the end of evolution in man's attire. Further changes doubtless will be made; the stiff, uncomfortable cuffs and collars (starched collars have been aptly called "corsets of the neck") will ere long be discarded, and other utilitarian changes cannot fail to follow. But there can be no question that the general principle of attire—utilitarian for the men and esthetic (or cosmetic) for the women—has been established for all time. This does not mean that men will give up elegance or good fit in garments, or discard their watch chains, scarf pins, colored neckties and socks; or that women will neglect to reconcile comfort and convenience as far as possible with the demands of beauty. But the trousers will remain for men notwithstanding their ugliness, and the skirt for women notwithstanding its inconvenience. The best tailor in the world could not make a pair of trousers a work of art; but skirts offer almost as wide a scope of beauty as the painter's canvas. Dressing is one of the fine arts, the one art in which men can never compete with women. Walk thru one of our large department stores, where the materials for women's raiment are on view. Look at the endless varieties of beautiful silks, satin, velvet, brocade, broadcloth, organdie, cashmere, chiffon, lace, crepe, Indian lawn, etc., available for skirts, and ask yourself once more: "Will women ever desert this realm of beauty and dress like men?" Perhaps they will—some day when the birds cease displaying their bright plumage in the air and take to tunneling the fields like moles and mice.

NEW YORK CITY.

The Race Question Solved in Buxton

BY GEORGE L. McNUTT

[Mr. McNutt for the past few years has been traveling up and down the land studying social and ethical conditions. Half the time he lectures, and half the way he works his way about from place to place. He was formerly a Presbyterian minister. Our readers no doubt recollect several of his former articles in these pages.—EDITOR.]

A COMMITTEE of the Senate ought to be sent to sit in Buxton for three months. The committee should include those Senators of the North and South who despair of a solution of the race question.

Buxton, Buxton, where is Buxton? What and why is Buxton? Buxton has only been on the map five years. A former Iowa mining camp, having exhausted all the coal in that field, moved bodily over into what is now the most important mining field in Iowa. There is supposed to be coal for fifty years, that is being mined at the rate of 4,000 tons a day. The population of Buxton is about 5,000, 93 per cent. black, 7 per cent. white. Buxton is a strip of the black belt transplanted to South Central Iowa. The negroes were brought in from the South originally to break a strike in the old camp. They were quick to learn the value of unionism. There is no more thoroly organized miners' union than the Buxton camp.

In Buxton the Senators would receive their mail from a negro postmaster; at the hotel their host would be a negro. They would find themselves in a community where everybody works, especially father. If father develops a tendency to loaf and to graft on his family, he will not remain long in Buxton. Only men who work can rent houses. There are no loafers, no grafters, in Buxton. Every able-bodied man works or gets out. Wages are good. Work goes on the year 'round under union conditions, at union prices. There is abundance of money in circulation. A part of the good wages goes into the State bank, the most goes into good clothes, good eatables, good furniture, genuine jewelry, candy, phonographs and shows. The Senators

BUXTON, IOWA.

Y. M. C. A. BUILDING, BUXTON, IOWA.
Dedicated July 4th, 1904. W. H. Reeves, President. Lewis E. Johnson, General Secretary.

would find no slums and no poverty in Buxton. They would find in the mines as perfect working conditions as executive ability and conscience can supply.

After the mines come naturally the *homes of the people.* Being a mining camp, all the houses are owned by the Consolidated Coal Company and are uniform, but are not huddled together. Each house is set in the center of a quarter of an acre of ground, giving opportunity for individuality in flowers, garden stuff, chickens and dogs. Prizes are offered for the best kept premises. Rents are $5.50 for a five-room, $6.50 for a six-room house. If the Senators called in their investigation at the house of the president of the Y. M. C. A. they would learn something suggestive. This president is a negro miner. They would be met at the door by a refined, motherly negro woman. They would see a nicely furnished house, with evidences of taste, of ambition, of pride. They would see a high-grade $400 piano, paid for cash down by the negro miner. The negro mother, with motherly ambition, is giving her children music lessons. The coal that is consumed in Buxton is carried by cable to the highest point in the town, to be distributed down hill by wagons and sold at $1.50 per ton. Evidence of business sagacity, common sense and a social conscience multiply.

The committee would, of course, go to *the schools.* Can the races teach and be taught in school together? The facts are interesting. The Buxton schools have grown from four teachers in a four-room building in 1904 to a ten-room building and twelve teachers today. Of the six hundred pupils, only sixty—one in ten—are white. The superintendent is a colored man. The teachers are colored and white. Of the mixing of the races in the schools Superintendent Gilliam says:

"There is absolutely no friction between the races. Of the very few cases of fights only twice have they been colored versus white, both last year. They play together, sit together and eat together. Nothing said about social equality. *The school is a matter of business."*

From the same authority we learn that:

"The teachers (black and white) are friendly and sociable, whether in school or on the playground. When school is over, they become private citizens and each seeks his own congenial friends."

To one looking for racial dynamite the school exhibit is discouraging.

Senators are familiar with the *beatitudes of monopoly.* They know that a monopoly can make, handle and transport goods more cheaply than is possible by the wasteful methods of competition. Every one, even Senators, know that the savings from monopoly go to the mystic shriners of the inner circle on the ground floor. The ancient and the modern plan is one—the public pays the tribute exacted by those who have the power to take and to keep.

It is not so in Buxton.

The Senators would find that the Monroe Mercantile Company has an absolute monopoly. Everything needed by 5,000 people is sold and distributed from this subsidiary company store. The Senators might be surprised to find a commercial monopoly, held as a sacred trust. They would find that the company store is permitted to earn only a fair return on the money invested. Beyond a fair return the savings of the monopoly store go into high quality of goods and low prices. This sort of monopoly is difficult to classify, unless we call it a case of compulsory common sense.

In *the store,* there is 50,000 square feet of floor space brilliantly lighted with electric lights, with twenty-one automatic girlless telephones. Any part of the town or mines can be reached without the aid of a "Hello girl." The Senators would find the company store more handsome than that in which most of their wives trade in their own home towns. They could scarcely suggest any improvement in the appearance, arrangement or cleanliness of the store, of the bearing of the people behind the counters, or of the quality of the goods on the shelves. It requires eight wagons to deliver the goods. One day in the week is order day, but each day is delivery day in only one-sixth of the town—everywhere, no duplication, no waste, no tax of the useless. The seventy-two clerks are whites and negroes, working together, neither insulting nor being insulted by one another, white girls waiting on black men, negro girls waiting on white men. In the bank they would find a negro woman and a white woman, one the teller, the other the cashier. Manager MacRae says:

"We cater to the wants of these people, just the same as though we were in a thickly populated town, with stores on each side of us, and we aim to carry every line and every need, from a rattlebox to a coffin."

By virtue of a monopoly for the good of all concerned, coal oil, 12 to 15 cents outside of Buxton, is only 10 cents; lard oil, 50 cents in Buxton, 60 to 75 cents outside. A similar reduction is made in miners' tools. Three things are not sold in Buxton—revolvers, whisky and a certain patent medicine. The patent medicine was withdrawn when a miner was found drunk with an empty bottle of the patent medicine at his side.

The Senators would be especially anxious to know about the standard of the *morals and manners* where the races live and work together. They would find a striking demonstration of the working theories of Booker T. Washington: "Give the black man skill to command good wages, with opportunity for work, the standard of morals and religion will rise." Buxton is a mathematical demonstration of the relation of economics to ethics. There have been no cases of rape by colored men. The bearing of the men and women is distinctly above that found among negroes living in the slum conditions of Northern cities. The store of an evening is a great social lobby. Manager MacRae says:

"The women do most of the shopping, but the men, after their work is over, and having obtained their supper, washed and changed clothes, etc., come to the store and make this their lounging headquarters. Our store will often have as high as three or four hundred people in it on both floors, when it is extremely hard to get thru; yet you will hear no loud talking or boisterous language—no serious disturbance of any kind.

"Once in a while some young fellow between the age of twelve and sixteen will get a little smart and defy some of our store rules. We allow no smoking upstairs nor swearing in any part of the building. When some of these young fellows get too smart we merely hand them over to an officer, who takes them before the Justice of Peace, who in turn will administer a good sound lecture and place a fine of from $5 to $20 on the young man. Some of these fines are suspended during his good behavior. In this

way we believe we have the most orderly camp in the Middle West."

Mr. Wilkins, who has lived as a skilled workman in the North and the South, and is now the master mechanic at the Buxton machine shops, says:

"I have been in a position for the past twelve years to make observations in negro settlements, both in the Southern States and in the North, and I never have seen any place of the population of Buxton where the people were better dressed, better fed, and made the money that they make in Buxton." (And he adds, quite naturally), "I have never seen a settlement of negroes that were more polite and genteel.

"The amount of crime committed here is very small and I think a great deal less than it would be in a camp of the same population of a mixed foreign element.

"The amount of intoxication here is small compared with the population. On the whole I think this is what might be called a model camp, an unincorporated town or city of 5,000 people with only one deputy sheriff and no paid officers of the law." (Except Justices of the Peace).

The unemployed time of employed people, white or black, is a problem everywhere. The Committee would find original efforts being made to solve this question. The abundance of money in Buxton and the nature of the people make it the best show town in the State. The Y. M. C. A. secretary is the theatrical manager and amusement censor of the town. He is given the opera hall, with a free hand to turn down whatever appears morally unfit. The secretary, Mr. Lewis E. Johnston, a refined, educated gentleman, who is "not colored, but born that way," has the pleasure of closing the doors against amusement enterprises of doubtful character. Any Saturday night when there is no show from outside, 2,000 feet of moving pictures are given for the good of all. It is quite natural to find with people so fond of music, that the graphophone in the Y. M. C. A. works overtime. A Y. M. C. A. swimming pool is being added that should rival the phonograph in popularity.

The Committee would want to know the "Moving Why" the race question is being solved so satisfactorily in Buxton. Where anything worth while is being done, back of it somewhere is a man worth while. The Committee would find back of and backing up Buxton a man of rare gifts, clearness of vision and courage, a man who could change places with any one of the Senators, with no serious loss to the United States Senate. They would find a man whose working motto is "There's nothing too good for the man who digs coal." Every miner can go direct to the superintendent with his grievance. These miners, black and white, are not angelic. They are hard to deal with; the superintendent is severely tried constantly. He is misunderstood. He has acquired, however, the great knack of going ahead and doing things, disregarding criticisms, finding the fun in life in a given task well done. This man, the superintendent of the Consolidated Coal Company, Mr. C. S. Buxton, is the son of the man for whom the town was named. He comes of Green Mountain stock. There is less politics and more business in Buxton than elsewhere. The unincorporated town is under his absolute control as a business boss. This may not be ideal democracy. It certainly is an improvement on numberless communities that are under the absolute control of the political boss. It is the Galveston and Indianapolis Commission plan Buxtonized.

Buxton has its drawbacks. No mining camp is an ideal place. The coal will be exhausted some time, then Buxton will decamp and disappear. There is lacking the motive to buy and improve property. But, here is a community where as yet the race question is solved. The school superintendent says: "A volume could be written. This school is solving on a small scale some of the race hatred." Business is business, in the store, on the streets and in the mines. The white woman is safe and sacred—so is the black woman. The crowds are lively, behaved, well dressed. In this community, overwhelmingly negro, the races work together, go to school together, but do not intermingle racially. Six days in the week, fifty-two weeks in the year, black men work in Buxton, making good money and making as good use of their money as white men, in Buxton or elsewhere. Buxton, like Tuskegee, is a bright spot. The facts are stubbornly, hopefully suggestive. Touching the race question, a Committee of the Senate could learn and unlearn volumes in Buxton.

New York City.

The Canada of Today

BY W. R. GIVENS

[Mr. Givens is a Canadian who has made New York his home for a number of years. Our readers will remember other articles from his pen, published in former issues of THE INDEPENDENT.—EDITOR.]

SOME months ago Sir Wilfrid Laurier, Canada's Prime Minister, undertook, in a speech at Athens, to explain why it is that Canada at the present time has barely 6,000,000 souls—that is to say, has stood still these many late years—while the United States at the same time has steadily and swiftly forged ahead until now it has nearly 80,000,000 people. Sir Wilfrid's explanation is that it is due almost wholly to the conditions that apparently could not be avoided at the moment: viz., that Canada had never really enjoyed free and representative government until a few years ago, that "there had been a war between England and France" just at a time when colonists were beginning to be attracted to Canada, and that, until Sir Wilfrid had come into power, the Canadian tariff policy had not been such as to advance Canada's best interests. From a political standpoint the speech was a pretty one; tho by the same token from a political standpoint it could easily be dissected and its weak points laid bare.

Not content with this utterance Sir Wilfrid has now followed this speech by a declaration at the Colonial Conference in London that so far as lies in his power he will endeavor to cement the bond of union and of Imperialism, so only that it be consistent with a proper measure of Home Rule. The remark is the more noticeable because at the same conference another colonial official, Mr. Deakin, of Australia, emphasized in no uncertain way the claim that the Colonies should be independent nations, pointing out so far as Australia is concerned that the problems of that country are not the problems of England. Sir Wilfrid Laurier might very well have made the same remark of Canada and her problems; but he did not. The wider view is not yet for him. Instead, he clearly purposes to continue a political and a fiscal policy which has, as it were, held Canada in chains these many years and has kept her almost stagnant while everywhere else there have been growth, development and prosperity. As for Canada—save the newer Western Canada that is growing in the very face of fiscal handicaps, due to the Western spirit of enterprise that is developing in that section, into which Americans and Europeans are now pouring in large numbers—it is pitifully backward. It is butting its head against the bulwarks of reason and the hard walls of Destiny. It is merely delaying the inevitable day of freer trade and social intercourse with this country—an intercourse that despite all artificial barriers against it, despite all the efforts of development in favor of England, is rapidly bringing this country and Canada nearer and nearer. What are the facts and figures? Do they warrant Premier Laurier's colonial conference declaration that "Canada is prepared to spend and will spend hundreds of millions of dollars more in order to make trade flow, not North and South (between Canada and the United States), but East and West, between Britain and Canada." The figures speak for themselves. The Canadian trade returns show that from 1898 to 1906, Canadian imports from Great Britain increased from $32,500,000 to $69,298,000, or $36,798,000. During the same time imports from the United States increased from $78,705,000 to $180,729,000, or $102,024,000. At the same time the exports from Canada to this country increased $43,500,000 while the increase of Canadian shipments to England has been only $34,400,000. When it is borne in mind that a large part of the Canadian shipments to the motherland are of breadstuffs, with which this country is

fully provided, the significance of the showing against the Canadian policy is more marked.

So much for the worse than futile trade policy. But there are other conditions that handicap Canada; for unquestionably Canada, the great Western section excepted, is not progressing in a material way as fast as her people, her position and her resources warrant.

And first let it be understood that it is with no intention of treating the matter in a political way that the present writer approaches the subject. The truth of the matter is that Canada is scarcely going ahead at all today. Were it not for the inflow, not a little of it from the United States, to the great Northwest, drawn there by reason of the natural wealth and fertility of that land, the Canadian population today, if an honest census were taken, would not improbably be found to be less than it was ten or twenty-five years ago. That is to say, what Canada has gained in the West—and she has gained that, not because of any trade, commercial or educational advantages she offers, but rather in spite of the lack of them and chiefly because Mother Earth is there fruitful and yielding—she largely has lost in the Eastern sections which in many parts might almost be said to be suffering from dry-rot. Daily, scores of the brightest of Canada's young men are leaving their native land for the United States, there to get what, so long as the present social, political and commercial systems exist and persist in Canada they cannot get at home—a fair chance, a Square Deal. The truth is that Canada is An Old Man's Land, ruled largely by old men, and running in its every phase of life in a narrow groove, rust on the rails, moss on the sides, and ballasted unevenly and insecurely. Hence it is that most of those who remain in Canada are prepared to accept as gospel from any leader, Liberal or Conservative, whatever explanation he may choose to give of Canada's backwardness or lethargy, the while the young men (you may count them by the thousands in New York, Boston, Chicago and other American cities) who have been forced to leave Canada for lack of opportunity and who have been given the opportunity in the United States, stand amazed at such gullibility.

Canada is not only an old man's land, but it is essentially not a place for young men. The field, limited at best, is doubly limited by the really crude and foolish notions that prevail there of "seniority" and of the rights of seniority. There one always feels, unlike Pitt, that one must actually endeavor either to palliate or to deny "the atrocious crime of being a young man." It will not necessarily benefit him that he have ability; he must advance "in order," rarely displacing an older man save in the event of death. Of course there are exceptions even in Canada to this rule; but these very exceptions prove the rule, which is applicable to all lines of business, to the law, to the church, to medicine, and, tho to lesser degree, to politics. In politics in Canada, as elsewhere, rewards come to those who "do things"—the word "do" being here used in the large sense—but for the very reason that Canadian young men are rarely permitted to do things even in politics, being kept in their "proper place" by their lordly elders, any political rewards that come to young men are few and far between. There are no young men leaders. In politics, it may be ventured, there is scarcely a man of prominence who is not well on to sixty years of age; in law, with one or two exceptions, the same statement will hold true; while in business it assuredly is true. Indeed, one may well wonder if Dr. Osler was not taking a sly dig at his former countrymen and hinting to them that the young men there be given a chance when he made his now celebrated dictum that a man's best work is done before forty. In Canada, however, it certainly is not done, and for the simple reason, already explained, that the young man has not a chance. Seeing this, the observant young man, when he is old enough properly to observe, promptly shakes the dust of the country off his shoes and gets him to the United States, where a man may be a man before his Canadian time.

Now why is this? Her people are of the same color, the same blood and the same temperament as the people of the United States; why, then, should there

be this difference? The answer is simple. The people are of the same color, but they are differently constituted. Canada, in short, is a hybrid land. Her people are Canadians and yet not Canadians; they are free and yet not free. To this very day there is real little Canadianism in the Dominion; there is really no such thing as a true Canadian spirit. The people are in the land, yet too many of them are not of it. In Quebec they are Frenchmen first, Canadians afterward; in the other provinces they are Britishers first, Canadians afterward. They come to the land and settle there, but they do not, as settlers do in the United States, forthwith prepare to become a part of the country and its institutions. Thus we see on Nelson or Trafalgar Day a formal protest from the French people in Canada against Canada joining in the celebration. If they are Britishers, they will always be Britishers, willing even to sacrifice Canada to the "Mother" land whenever the interests of the latter seem to need or demand it, whether in framing a tariff favorable to British goods and against Americans or in submitting to what manifestly is an unfair treaty award made by British members. Thus when the South African war broke out Canada sent her men to the front and they fought a good fight —for which they received their pay, after much bickering and red tape, many months afterward. Loyalty—and loyalty! It is the very recognition of this undoubtedly that prompted Mr. Deakin's remark at the Colonial Conference that the Colonial Office is further from the colonies than the colonies from the Colonial Office.

Several things follow from this. One is that Canada, with the exception of Quebec (which is French), being much more British than Canadian, holds largely to British ideas. Hence we see in Canada the same reverence as in England for name and for family, tho the family be degenerate and the name almost a laughing-stock; hence in Canada, as in England, the lines of social cleavage are great, and tradespeople are still tradespeople and artisans still artisans, however successful and brilliant and brainy they may be; and hence, handicapped as any young man is by the mere fact of his youth, the poor young man who has no "family" is hopelessly and almost forever doomed not only in a business, but also in a social way. The stream, the "familied people" will tell you, cannot rise higher than its source. And yet if in the end the young man should perchance make a name for himself, and success and fortune—if he make them it would almost inevitably be elsewhere than in Canada—these same people would be the first to bow down to him. For in Canada, and here it differs from England, they worship money as they do not in England. The explanation for this may be found in the fact that Canada is a poor country, with few rich men, and that for that reason, as in any new country, wealth plays a much more important part than in the older lands.

It follows further from this, that her political and fiscal policies are shaped rather along lines of sentiment than along lines of reason and good sense. It is this that explains the ever-present wish in Canada to draw the bonds of empire closer, the consuming desire forever to be stretching hands "across the sea," and the almost total disappearance of what at one time promised to develop into a strong desire for annexation with the United States. Out of this in large measure grows such wish as there is in Canada to help Joseph Chamberlain in his policy of "getting together"; out of this has grown the policy of catering to England and her manufacturers by admitting their goods into Canada at a low duty, in the hope of building up a great British-Canadian trade; out of this has sprung the policy not only of neglecting, but also of deliberately fighting the enlargement of trade with Canada's most natural customer and in Canada's best and most accessible market, the United States. Indeed, it is a truth that whereas England and the United States are closer together today than they have been in years, there is in Canada a feeling toward the United States, why one cannot readily explain, of something more than resentment, of something bordering on hostility. Analyzed, this feeling would probably be found to be nothing more than an aggravated attack of jealousy of a peculiar kind—jealousy resulting from

the phenomenal growth and prosperity of the United States.

Take, in this connection, the shudder—almost a convulsion—that went thru the length and breadth of Canada when it was discovered that a few American engineers were being employed on the Grand Trunk Pacific Railway, which was (and is yet) to be built with the money of the people—the Canadian people. "Sdeath! Treason!" At once a Royal or other commission was appointed, with orders to investigate the great crime to the fullest, and, if it were proved, to deport the presumptuous persons who had dared to seek to make a living on Canadian soil and deprive honest Canadian labor of honest Canadian money furnished by the honest Canadian people themselves. In the end it is an actual fact that some Americans were deported and their places filled with Canadians who could have had little experience, for there has been little railroad building in Canada for some time. And yet, while these politicians were howling so bitterly against this outrage, there were at that very moment, and still are, sixty out of every hundred men in Canada with brothers or sons or near relatives working in the United States—freely working, and at much better salaries than they could ever hope to make in Canada. But what is sauce for the goose is not sauce for the gander.

But, it may be asked, what of the Canadian-born who remain in Canada? Will they not in time create a new order of things? Will not a true, liberal Canadian spirit be born through them? Surely they will not be content forever to let prevail in their own land old-fogyish British notions which Great Britain herself has outgrown, but which these provincials still cling to! Surely in this new country old things will pass away—erroneous ideas of "duty" to the motherland even to the sacrifice of Canada; false notions of the value of a decrepit family connection; old age, tho senile, given recognition over youth and ability! Surely the time will come when the Canadian Senate, which is appointed and therein differs from the British House of Lords (tho the "duties" of the two bodies are supposed to be similar), will, for once in its existence, cease to be a house of fossils and antiquities. Surely the military "set" will not always dare to presume to lord it over the civilians. One certainly would think that all these would be; but truth compels the statement that there seems to be little hope for any such consummation, devoutly tho it is to be wished. And why? The answer lies in the fact that, under the present system of molding public opinion in Canada, there is produced, as has been said before, no real Canadian spirit or sentiment. The greatest educators in this direction, it will not be denied, are the universities, the newspapers and the magazines. In respect to the Canadian universities what are the conditions? What, if not that most of the professors are old-country men from England or Scotland, born abroad and educated abroad. They come to Canada knowing nothing of it save that it is an adjunct of Great Britain. The consequence, more often than not, is that they are intolerant, self-opinionative, and, if opposed, more than ever British. It is these men, then, who largely educate the young men of Canada—these foreigners, to whom Kipling's question might well be applied: "What do they know of England who only England know?" Is it to be wondered that the Canadian young idea is taught how to shoot largely in a British way, and that a Canadian is howled down as a traitor or worse who dares to speak of natural markets with near neighbors, of foolish notions of a great trade with a market 3,000 miles away that will not take that trade, of the folly of paying a Governor-General, appointed in England, $50,000 a year to be a social figurehead, and of pursuing a policy that in the end will antagonize a country, at their very side, bound closer now to them thru ties of consanguinity and affinity—fathers and sons, brothers and sisters who have ventured out to a free land to earn a free living, discouraged or disgusted with their own country—than is the so-called motherland thru the combined ties of blood and patriotism and empire.

And the newspapers—do they not do better than the universities toward making a Canadian sentiment? Better? Worse—infinitely worse. For there is not in all Canada what may strictly be termed a news-paper. Party organs

there are by the score, papers that follow blindly the lead of the politicians; but real newspapers are not. Independence in Canadian newspaper thought is a thing unheard of. In one city only in Canada—Toronto—is there any paper that professes to be independent—the Toronto *News*. But the other Canadian papers are what they tacitly admit themselves to be—organs of one party or another. Their crest might well be a politician rampant on a bed of party spoils. Such a thing as a paper "bolting" the ticket, as often newspapers do in the United States in times of national stress, is next to unheard of in Canada. One has but to watch the antics of these papers on any day following an important declaration by any political leader. Set up, on end, a row of dominoes, one near the other, and give, then, a slight touch to the one on the extreme end. Presto, they go tumbling down, all in the same direction, all together, influenced all by the same touch. The news columns are no less unfair, their political reports colored to suit their political complexions. Hence it is that the press associations who furnish the newspapers of Canada their telegraph news are obliged to send out two services; one to the Liberal papers, telling what a joy forever, let us say, a Liberal gathering was, another to the Conservative papers explaining what a "frost" this same gathering was. As for the magazines, there really is nothing to say, for there is only one Canadian magazine, tho as I write another is being born, and it can scarcely be said to fill a long-felt want. The universities, to be sure, publish monthlies or quarterlies, and in their way these are very good. But even here the curse of Canada, this terrible weight of party shackles, shows itself. Only a few months ago the *Queen's University Quarterly*, published at Kingston, Ont., was held up in its issue for several months because its business manager, a former student, objected to an article, written by a professor, on the separate school question, then under discussion in Parliament. It is, perhaps, needless to say that every Liberal paper in Canada that touched upon the matter upheld the manager, for the article was unfavorable to the Liberal policy; while the Conservative papers, their cause having been espoused, proclaimed the professor a martyr and the manager a traitor. Even the university professors themselves said a few unkind words to one another over the affair. Such is the Canadian condition.

Is it to be wondered, then, that in Canada there is little advancement in political thought; that here one is a Liberal because his father before him was a Liberal; that here one meets a Conservative who is Conservative by descent and heredity, and vows, with God's help, to have his sons after him, and their sons and their sons' sons Conservatives also —with the chances 900 to 1,000 that he can go to his grave happy in the thought that it will be, one hundred years hence, as he hopes it will be. It would be laughable were it not so pitiful.

It is fortunate for Canada that she can boast, as she well can do, that her system of finance is unexcelled, that her laws are well administered and her judiciary clean and incorruptible and that her people, whatever their other faults, are a sober, industrious, honest, moral, God-fearing people. For clearly they have need of all these excellencies and virtues in the face of such shortcomings as burden them down.

As I have said, these remarks apply largely to the older Provinces of Canada. The new West promises to take care of itself—mayhap in time to shape Canadian thought aright and free the country from the shackles that now bind it.

Canada badly needs a rallying cry. That cry should be, not Canada for Great Britain but rather Canada for Canada and Freedom—not necessarily freedom from Great Britain but at least freedom from political servitude and servility, freedom from imported foreign ideas, freedom from red tape that kills, freedom to seek natural markets naturally; best of all freedom for her young men, if they remain in Canada, to do and not to die.

New York City.

Literature

Confederate History

THAT the Civil War continues to engage the greater part of the intellectual activity of the South is hardly a matter of doubt. A constant stream of histories and of biographies and reminiscences of participants in the struggle is poured from the Southern press. All the chief civil officers and diplomats, the generals, many of the colonels and majors, have been appropriately "biographed," either by others or by themselves, and even the privates are contributing their share of the print.

The appearance of the privates, however, need not alarm such persons as may be apprehensive of an unending flood of this kind of literature. For the privates, unlike the officers, are numbered. Most persons have doubtless heard of Private John Allen, of Tupelo. Mr. James K. Jones, onetime Senator from Arkansas, confesses that he also was a private, and that he knows of at least one other—a gentleman, name not given, resident in Montana. There may be, here and there, a few other undecorated survivors from the Southern armies, but they are not numerous enough to threaten a great addition to Confederate history. What danger there is comes from a tendency toward an intensive cultivation of the field—a rewriting over and over again of the lives and recollections of those who have already had their say.

In this field at least the pen is proving a mightiness to which the sword can lay no claim. What was won at Vicksburg and Chattanooga and Appomattox is being lost thru the writings of the defeated. While the North busies itself with mechanics and science and economics, the South sets itself to the task of handing down to another generation its own account of the Civil War. As a consequence, the Southern view of that war and Southern statements of what happened during its course, win a wider acceptance year by year. The mere power of reiteration is a powerful agency to that end. But a still greater agency is the economic demand of the South. Our school histories must now all be written with a view to meeting the prepossessions of the South, for the South will tolerate no view except its own, while the North is for the most part indifferent. Even in histories written for the general public this indifference of the North and this partisanship of the South are taken into account commercially, and a prominent publishing house is led to attach the title "The True History of the Civil War" to a volume which is not a history in any sense, but a bitterly partisan declamation in behalf of the Confederate cause, crowded with inaccuracies of every kind.

A striking characteristic of most Confederate history is what is usually known as tall talk. The Southern mind, in so far as one may generalize regarding the collective mind of a geographical section, is not an analytic or introspective one, but it is a highly imaginative and emotional one. It does not run to statistics, nor to an exact balancing of relations, nor to self-examination. No shade of dubiety crosses its fervid convictions. Like the Celtic mind, it shows a constant "reaction against the despotism of fact." But unlike the Celtic mind, it does not take refuge in mysticism or magic. Rather it manifests itself in setting up *effigies* of reality; it translates its prejudgments and beliefs into certainties, and to these it holds with unalterable devotion. The thing it wishes to believe it finds no difficulty in believing; and the thing it wishes to disbelieve need ask no support from irrefutable records. It sees the world checkered with high lights and deep glooms, and it takes small account of shades of gradation. And the diction in which it expresses itself is generally pitched to a strain two or three strata above that employed by others of the Teutonic races.

For the Civil War it has fixed upon certain conventionalized beliefs, which are reflected in virtually all Confederate accounts of the struggle: That an army numbering, all told, 600,000 patriotic Southerners, unfalteringly held the field for four years against a Xerxian army of 2,700,000 conscripted foreigners and

native mudsills; that this noble band almost everywhere defeated the invaders; that what was left of it at last laid down its arms "wearied out with victory," and that while the Southern armies invariably conducted themselves according to the highest standards of civilized warfare, their opponents habitually violated all laws and carried on a war of savage conquest.

It does not matter that the facts make this conventional view utterly ridiculous. No very efficient sense of absurdity can be supposed of a slaveholding oligarchy which took for one of its shibboleths the opening lines of "The Bonnie Blue Flag":

"We are a band of brothers, and native to the soil,
Fighting for the property we gained by honest toil."

A sense of literalness is defective in such a people. They see and think in illusion, and the records disturb them not. That the South brought into the field more than 1,000,000 men (Mr. A. B. Casselman's studies indicate 1,500,000); that the North brought into the field probably not more than 1,500,000 men and certainly not more than 1,700,000 (Professor Woodrow Wilson's estimate); that only a relative few of these were foreigners; that conscription was far more rigorously enforced in the South than in the North; that desertion, particularly in the last year of the war, was far more common in the Southern than in the Northern armies—all these are truths of which any sincere student can satisfy himself by a little investigation. He can also easily learn that at virtually all points of actual contact, leaving out the few exceptions such as Chancellorsville and the pursuit of Lee from Richmond, the two forces were not unevenly matched; that defeats such as those of Hood at Nashville and of Bragg at Chattanooga were of a character suffered by no large Northern army, and that the seizure or destruction of private property was an act common to both armies. Those who in their denunciation of Sherman and Sheridan can overlook Bragg and Mosby and Forrest and Morgan and Early, can scarcely be regarded as impartial judges of the right and wrong of military depredations.

Several of the books mentioned below give glimpses of the extent of desertion in the Southern armies. Major Stiles[1] has a particularly interesting and pathetic passage (pp. 349-50) and quotes further from Colonel Walter H. Taylor on the same subject. General Duke[2] (pp. 411-413) has much to say of deserters and the "terrible depredations" they committed in certain sections. Mr. Reagan[3] gives several instances of depredations on public stores and remarks (p. 211), "I was forced to the thought that the line between barbarism and civilization is at times very narrow." Dr. Jones,[4] "The Fighting Parson," reproduces a letter of General Lee's, dated February 24th, 1865, stating that in two weeks "several hundred have deserted from Hill's corps." Desertions, however, were not limited to this time. After Antietam General Lee complained that his army was melting away and would disappear unless something were promptly done.

Dr. Jones's volume gives a fairly readable collection of letters and other data regarding General Lee. But it is marred by a narrow partisanship and a good deal of inaccuracy of statement. Such declarations (p. 371) as "There were [before Appomattox] only 7,892 jaded, half-famished Confederates with arms in their hands surrounded by 80,000 Federal troops"; as that Pickett's "14,000 heroes in gray," at Gettysburg (p. 251), attacked "an army of nearly 100,000 men, in a strong position, heavily fortified," and his statement of the relative forces at that battle (p. 252) are mere declamation. He has taken it upon himself, like a good many other Confederate writers, to pay compliments to McClellan, and quotes with evident approval a statement made by General Long, Lee's military secretary, in which the Confederate commander is made to say that "McClellan, by all odds," was the ablest of the Union Generals. This story, however, is rendered doubtful by Major Stiles (p. 228), who represents his commander as declar-

[1] Four Years Under Marse Lee. *By Robert Stiles.* (Third Edition.) New York: The Neale Publishing Co. $2.00.
[2] Morgan's Cavalry. *By Basil W. Duke.* New York: The Neale Publishing Co. $2.00.
[3] Memoirs. *By John H. Reagan.* New York: The Neale Publishing Co. $3.00.
[4] Life and Letters of Robert E. Lee. *By the Rev. J. William Jones.* New York: The Neale Publishing Co. $2.00.

ing that Meade "was the most dangerous man who had as yet been opposed to him." Another statement of Dr. Jones's —that Colonel Walter H. Taylor's "admirable book," "Four Years with Lee," "settles the question of relative numbers in all of the battles"—can only be dismissed with a smile.

Major Stiles's book is an interesting collection of reminiscences. It is simply and directly told, with many felicitous touches here and there, and gives a convincing picture of the soldier's life in camp and on the battlefield. It is free, too, from that proneness to dogmatic assertion which mars so much of this sort of writing. Of the same general character is General Sorrel's book.[5] It is even less of a narrative, but is more vivaciously written, and its pictures of camp and field and of the more striking personalities of the Southern armies are admirable.

General Duke gives in great detail the operations of Morgan's cavalry. He has had the industry and the good taste to look into the War Records for confirmation of some of his statements. One cannot help wishing, however, to have at hand for comparison, Federal accounts of each of these almost innumerable engagements he has chronicled.

Lieutenant Headley[6] tells frankly of his connection with the plots engineered from Canada for burning the Northern cities in 1864. He took part in the work performed in New York City, setting fire to his room in the Astor House. Others set fire to various hotels about the city, and even in Barnum's Museum, at the time filled with women and children, a blaze was started. An interesting passage on page 267 indicates that in the opinion of the plotters Governor Horatio Seymour was in entire sympathy with their diabolical program. The book laboriously seeks to justify those deeds on account of Sheridan's and Hunter's depredations in the Shenandoah Valley and Sherman's in Atlanta and on the march to the sea. As for one of the plotters, Captain Robert Cobb Kennedy, afterward captured and executed for the Barnum Museum outrage, we are naïvely told (p. 331): "He possessed all the attributes of a gentleman."

There is nothing quite so striking in Mr. Reagan's reminiscences as the evidence of his eagerness, immediately on the close of his four years of service against the United States, to advise President Andrew Johnson as to what he should do. His famous "Fort Warren letter," written while a prisoner in Boston Harbor in the summer of 1865, was certainly generous in well-meant advice. There seems to be, however, no evidence that the President availed himself of it. Mr. Mason,[7] the Confederate agent in England, was more of a fire-eater and an irreconcilable. He had no advice to give. It is interesting to note with what fatuity he kept on predicting the success of the South to the end of the struggle. Even on June 14th, more than two months after Lee's surrender, he writes that he is waiting to see how Texas acts. He did not return to the United States and to Virginia until the early summer of 1869, and he died less than two years after, on April 28th, 1871.

Professor Fleming's second volume of his reconstruction history[8] is a remarkable collection of documents. The industry, patience and information displayed in it are worthy of high praise. It is, of course, partisan, tho a considerable number of selections opposed to the dominant Southern view are given. Bad as the carpet-bag governments were, there is something more to be said for them than is to be found here. But as a massing together of illustrative material for future historical work it is of extreme value.

Tales of the Artistic Life

There has recently been published a quartet of books dealing with the artistic life: Clara E. Laughlin's *Felicity*,[9] "The Story of the Making of a Comedienne," as the sub-title has it; Myra Kelly's *The*

[5] Recollections of a Confederate Staff Officer. *By G. Moxley Sorrel.* New York: The Neale Publishing Co. $2.00.

[6] Confederate Operations in Canada and New York. New York: The Neale Publishing Co. $2.00.

[7] The Public Life and Diplomatic Correspondence of James M. Mason. *By Virginia Mason.* New York: The Neale Publishing Co. $3.50.

[8] Documentary History of Reconstruction. *By Walter L. Fleming.* Vol. II. Cleveland: The Arthur H. Clark Co.

[9] Felicity. *By Clara E. Laughlin.* New York: Charles Scribner's Sons. $1.50.

Isle of Dreams,[2] whose heroine is a woman painter; Ellen Olney Kirk's *Marcia*,[3] being a mild narrative of the adventures of a New England girl cast upon her own resources, whom the author considerately dowers before she has the opportunity, or faces the necessity, of discovering whether her taste for writing be really a talent or not; and Ellis Meredith's *Under the Harrow*,[4] which is concerned with a newspaper woman, a woman illustrator, a struggling young lawyer, a dramatist, and some others. Three of these stories have New York for their setting, wholly or in part, and in all three the local atmosphere is not strong. Felicity roams the country, climbing laboriously from one-night stands to a Broadway success, ending where the others attempt to make a beginning. Hers is the only story of the four deserving serious attention.

It is rather curious that the life of the stage, so interesting to many people, who never tire of reading about the favorites of the footlights, even unto the most trivial of anecdotes regarding their personalities, is so scantily represented in our fiction, and with so small a measure of popular success. Here is a profession, it would appear, whose contrasts of mimic and real existence must strongly attract the novelist in search of material by their romantic and dramatic possibilities, and interest the public as well. As a matter of fact, however, only three serious American novels of stage life occur to us at the present writing, and the fortunes of all three of them indicate that the glamour with which the public surrounds the player-folk on the boards and in their private lives does not lure it to read novels about them, however ready it may be to buy their biographies. These three stories are: Mrs. Anne Robeson Brown's "The Immortal Garland," a searching analytical study of the player's art and temperament in the rare instances where they reach the hights of genius, and Mr. John D. Barry's realistic "The Leading Lady" and "A Daughter of Thespis." To these may be added, for the sake of the record, Mr. James L. Ford's satirical "Dolly Dillenbeck," which is not, however, concerned so much with the art of the profession as with its shams, and whose atmosphere is that of the night restaurants of the Great White Way. Of the three, Mrs. Brown idealizes, Mr. Barry is impartially realistic, Mr. Ford disillusionizes.

Felicity certainly does not do that (no comparison of any kind is suggested here between this story and that of the cynical Mr. Ford), but, at the same time, it does not hide the seamy side, the drudgery and sacrifice and discouragement that go to the making of the value of triumph as well as of the cost of failure. Felicity is a born actress, yes, but the training of her natural talent takes many weary years. The story is written with insight, with evident fulness of knowledge, but also with discreet judgment in the selection and use of the realistic material at the author's command. It is the first American story of stage life that promises to achieve a popular success, perhaps because it does not go too far below the surface.

Myra Kelly's *The Isle of Dreams* proves to be a disappointment after the high expectations raised by her "Little Citizens." This first novel from her pen is thin in texture, and superficial in its treatment of characters, plot and atmosphere, *voulu*, as the French have it, and at that *voulu* with a great deal of labored persistency to fill the required number of pages. A tale of a painter, the book does not contain a single flash of insight, or even of mere interest, in the painter's art: it is just a love story, prettily but weakly told. In "Little Citizens" Miss Kelly demonstrated that she possesses the gift of close, sympathetic, yet humorous observation, and the talent of vivid reproduction of what she has seen, which is reporting raised to the dignity of art. Her novel would appear to indicate that she lacks the novelist's greater gift of imagination, the power of visualizing to herself the web of her invention.

Marcia is remarkable for nothing but the facility with which a practiced hand can make a fairly readable tale out of indifferent material. The narrative purls along peacefully over its shallow bed of stock situations and conventional characters, over obstacles that offer not too much resistance, and griefs that are not

[2] THE ISLE OF DREAMS. *By Myra Kelly.* New York: D. Appleton & Co. $1.50.
[3] MARCIA. *By Ellen Olney Kirk.* Boston: Houghton, Mifflin & Co. $1.50.
[4] UNDER THE HARROW. *By Ellis Meredith.* Boston: Little, Brown & Co. $1.50.

too poignant, to a placidly satisfactory ending. One does not become deeply interested, one is not greatly bored: the discerning reader knows from the first that that rocky tract of soil in Montana will in the end yield silver, or something; one feels at once that this girl takes to writing, not because she hears the irresistible call, but because she has to do something, and this appears to be the easiest thing to do; one never learns enough of the play, to whose success she contributes so materially, to take much stock in it; and the amateur actress who becomes a star at the first try, so to speak, is hardly convincing. All the "artistic temperaments" in the book but this actress's are carefully wrapped in social absorbent cotton, while hers is not nearly so disturbing to the reader as, according to the author, it is to the other characters in the story. In the other books, too, it may be added, this "artistic temperament" is well under control.

Under the Harrow is a well-meant picture of the struggles of the beginners in New York's Bohemia, amusing here and there, but unimportant on the whole. One would like to know where in Gotham is to be found the city editor who has power to discharge his paper's music critic, but that is a mere detail.

The Prisoner at the Bar: Sidelights on the Administration of Criminal Justice. By Arthur Train. New York: Charles Scribner's Sons. $2.00.

From every point of view this is a desirable book. It is an exposition, in no way technical, of the criminal law in action, by a member of District-Attorney Jerome's staff. If the man who gets his law from the newspapers reads it, good, for Mr. Train knows his subject and illustrates the problems of criminal practice in the detection and indictment of lawbreakers, and the winnowing of possible evidence and urging the case to a just end. The case of the People *ex rel.* Appleboy *v.* Halohan, laughably explains some of the law's delays, and has some title to a place beside the more famous case of Peter Peebles. Irritating as delays are and often as there seems to be miscarriage of justice, Mr. Train shows reasons for it all. He shows an advance in many ways in our practice, and at times he criticises frankly. He questions the traditionally required agreement of the jury—why not eleven-twelfths of it? He doubts if one judge is more lenient than another, but thinks them all too lenient. There is a good study of the jury—that enigma in the land—its sympathies, its prejudices, its sometime weariness, its interpretation of "reasonable doubt," its rarely returning in less time than it takes to burn a cigar; the effect of experience and of novelty in the juryman, and its relation with the judge and his influence on a case. Interesting and valuable are the tables and data, showing the classes of crime and criminals, the disposition of cases, the time taken in trials, and the influence of the sex of the prisoner. Let no one think that because Mr. Train has written a book lightly readable and brimming with humor that it has no significance. The opinion of one chosen and disciplined for dealing with crime is to be seriously considered. He says crime is fostered by lack of regard for law, by financial ambition, by exaggerated regard for personal liberty and technical doors of escape. He has views, too, as to reformers, newspapers trials and dodgers of jury service.

The Malefactor. By E. Phillips Oppenheim. Boston: Little, Brown & Co. $1.50.

A man just out of prison faces a stern world. If he is poor and unknown he may build up a reputation after a time, in a new place, but if he is so unfortunate as to be rich and conspicuous in a social way, like the hero of Mr. Oppenheim's new book, Sir Wingrave Seton, he is in a hard place. He cannot conceal the past, which everybody knows, and if he changes his name he loses his title and whatever advantage his family might give him. Ten years of unjust imprisonment to save a woman's reputation, when a word from her would have freed him, does not leave a man in an amiable mood toward those who caused his severe sentence. Altho one of them is a beautiful and fascinating woman, we naturally expect reprisals, nor do they fail. The hero is perhaps too icily inhuman, too near the absolute zero in his moral temperature, too little one in this

plans of vengeance, to be a very probable person, but we do not blame him for his cold anger, after he has kept it on ice for ten years of brooding in a prison cell. Such years of undeserved pain leave their mark upon a man, but he is more likely to be bitter than cynical, to be fiery than cold. Coming back into a world which has done without us for years is always a test of one's metal; in the case Mr. Oppenheim supposes the test and its results are of an unusual character and interest.

Literary Notes

....A thoro study of the Johnson's Island plot to capture the United States steamship "Michigan" and release the Confederate prisoners, in 1864, has been made from original sources by Frederick J. Shepard, and appears in Vol. IX, of the Publications of the Buffalo Historical Society.

....The sermons of the Rev. Bernard Vaughan, S. J., which made such a sensation in London for the outspoken manner in which they dealt with the vices of the upper classes, have found an American publisher in Mr. B. Herder, of St. Louis. The title is *The Sins of Society*, and the price $1.35.

....Mr. George Ade has betaken himself to Turkey in his latest story, *The Slim Princess*, and his freakish humor finds a congenial field in a country where, in order to be beautiful, a woman must be bounteously fat. The adventures of the poor, slim Princess, who cannet get fat, make an unhackneyed plot. The illustrations are in color. (The Bobbs-Merrill Co.)

....The Highlanders of Scotland are honored in recent fiction, with at least two lively accounts of their deeds, misdeeds, frays, forays and feuds, "Graham of Claverhouse," by Ian Maclaren, and *The Master of Stair*, by Marjorie Bowen. The latter is a story of the Campbell clan, and the pages are drenched with blood and dark with the old hates Miss Bowen loves to resurrect. (McClure, Phillips & Co. $1.50.)

....There is something attractive about a bishop of whom a six-year-old girl can say she "loves to walk with him because he hasn't any morals." Such a bishop is the leading figure in Mary Raymond Shipman Andrews' book, *The Militants*, "parsons, soldiers and other fighters in the world." It is not so good as "Bob and the Guides" of last year, but we could hardly expect another Bob, and bishops are, perhaps, never quite so engaging as when they are fishing, and the stories they tell omit the moral. (Scribner's. $1.50.)

....*The Story of Samson, and Its Place in the Religious Development of Mankind.* By Paul Carus. With many illustrations. 8vo. pp. vii, 183. Open Court Publishing Co., Chicago ($1.00). Dr. Carus is especially devoted to subjects which allow him to relate Oriental and classical myths to Biblical accounts. These he illustrates freely and in an interesting way. As might be expected, he regards Samson as a mythical sun-hero, who is to be correlated with the Greek Hercules and the Babylonian Gilgamest. We cannot always accept his interpretations, as when, following at this late day George Smith, he discovers on old seals the Babylonian Noah and Charon. But the suggestions of the text and the many illustrations will interest the student as well as the ordinary reader.

Pebbles

Miss Bessie Mae Miller is a queen among women for beauty, grace and elegance. She is a *petite* brunet, with large, expressive brown eyes that are brighter than any of the stars one may see from the summit of our highest mountains on the darkest nights that ever gave them added glory. Her lips are like the rarest roses; her cheeks are warm and ruddy as the eastern sky when morning walketh thru the open gates of dawn. When she smiles it is the sunshine smiling thru the clouds. Her voice is a sweet stream flowing along the rocky ridges of a fair and goodly land; her laughter is the far-heard tinkle of well-tuned bells; her hands are the most beautiful I have ever seen mortised to human wrists; they are hands to be modeled—small, white and shapely hands—hands that the sculptor of the Venus Callipyge might have cut in marble and left the stone as an imperishable evidence that art could not rival nature; hands that Benvenuto Cellini would have copied on his cameos and given his work new beauty. And they were useful hands, as the reader will learn farther on. Miss Miller is a little below medium height, slender, graceful, and has an independent, queenly poise of the head that is peculiarly attractive. Two and one-half years ago Miss Miller went from here to Annapolis, Md., where she accepted a position as saleslady in one of the largest mercantile establishments in that city. At the end of two weeks her sales were largely in excess of any other of the large number of clerks employed there, and at the end of five weeks she was promoted to chief bookkeeper, which position she still retains. In the good old science of the kitchen laboratory Miss Miller is an artist. She can bake bread and potatoes, broil beefsteak and prepare dainty dishes that would make the chefs of Delmonico's turn green with envy. Miss Miller, in artistic needlework, is a genius in all that the word implies. She manufactures her gowns from her own designs, and they are "dreams of beauty" woven in the loom of her own genius. I have seen her take a piece of some dainty fabric sixteen inches wide and fifty-eight inches long and evolve from it one of the most beautiful pieces of "Mexican drawn work" that I have ever seen—it was truly a work of art.—*Bedford (Pa.) Gazette.*

Editorials

San Francisco's Corruption

It was the avowed purpose of that great prosecutor of respectable thieves, Francis J. Heney, to bring to justice in San Francisco those who most richly deserved the punishment provided by law for bribery and corruption. Beginning with the bribed, he persistently sought the bribers. With confessions of seventeen supervisors in his hands, he pursued relentlessly the Boss who had negotiated the sale of their votes, the Mayor who had sold the influence of his high office, and the capitalist beneficiaries of corruption who had paid the price. The clerks and blacksmiths and hackdrivers who constituted that unworthy Board of Supervisors were at his mercy; they must be the instruments by which he should reach the men who were even more guilty, the men "higher up." In many instances the exposure of official corruption in American municipal and State governments has not been followed by the legal punishment of the originators of the rascality, who moved in elevated spheres of business and finance, altho the public may have had a decided opinion as to their guilt. Mr. Heney determined that in San Francisco the offenders of this grade should not escape.

And so the net was woven around Boss Ruef until in despair he confessed. And his testimony served not only to complete the prosecutor's case against Mayor Schmitz, but also to lay a foundation for the indictment of those who bought the legislation which the supervisors were induced to sell. To the list of the indicted, which already included the millionaire president of a telephone company, have now been added half a dozen other millionaires, two or three prominent attorneys, and the president of the street railway company.

Alas! that a grandson of John C. Calhoun and a descendant of Patrick Henry should so be placed before the American people! We do not assume that Mr. Calhoun is guilty. The evidence that a large sum of money was corruptly paid in the interest of his company seems conclusive. It does not necessarily follow that this money was so used with his knowledge and approval. But he must seek a better defense than can be found in bitter attacks upon Prosecutor Heney and upon the public spirited citizen of San Francisco who promoted the investigation which has laid bare so much corruption. When he asks the American public to believe that Mr. Heney and Mr. Rudolph Spreckels have conspired wickedly to obtain control of the municipal government in order that they may rob his company of its franchises and property for their own enrichment, he excites neither respect nor sympathy. That is an utterly absurd and incredible proposition. He should reserve his energies for attacks upon the evidence, and should not be content with echoing the silly pleas by which Schmitz sought to escape trial.

Few additional indictments will be reported, and they will be comparatively of little importance. In those announced last week the culmination of the campaign of reform was reached, so far as grand jury work is concerned. The record of corrupt acts would be a disheartening and hopeless one but for the evidence that a majority of the people of San Francisco are now determined that the thieves shall be punished and that their rotten government shall give way to an honest one. The issue will be in their hands. If a majority of the voters really want honest government and insist upon having it, they can obtain it. But after exercising care in the nomination and election of public officers, they must remain on guard. Mr. Spreckels proposes that the conduct of municipal affairs shall be subjected to the continuous inspection of a voluntary civic organization acting as a kind of auditing committee. That is a good project. But experience shows that such organizations, created after exposures of municipal corruption and fraud, become lax and inefficient with the lapse of time. Eternal vigilance is the price of freedom from municipal jobbery.

The immediate duty of the honest residents of San Francisco is to support the

agencies of the law and to procure the just punishment of every rascal who has been indicted. Sure and severe punishment is a potent agency for reform. When unscrupulous capitalists know that detection will open for them the doors of the penitentiary, they hesitate a long time about offering to a municipal legislator a bribe. Let the laws be enforced. There is safety in that. And the heavy hand of hostile public opinion should be felt by every one who has been false to the people, be he a blacksmith, a supervisor, a corporation lawyer, a weak and corrupt mayor, a millionaire director of a gas company, or the president of some other public service corporation. Society should frown upon him; clubs should cast him out; the churches, if he happen to be a member of any of them, should subject him to the severest discipline and retain him in fellowship only after confession, repentance and ample restitution.

At this stage in the work of Francis J. Heney it seems fitting to say that America has known no other prosecutor of like quality since the time when Folk smote the municipal thieves in St. Louis. Mr. Heney brought with him to San Francisco a record of achievement. In his pursuit of the land thieves of the Far Northwest he had been remarkably successful. There also he had not been content with detecting the crimes of petty officers and obscure men who had been mere tools; but he had striven earnestly to convict the men "higher up," rich landowners, Representatives in Congress, and even a Senator of the United States. He is a fearless man. During the first days of his service in San Francisco he needed all his courage. Ruef and Schmitz, with a sympathetic sheriff, a subservient police force, a corrupt Board of Supervisors, and judges whose attitude was in doubt, were masters of the town. He attended strictly to business, and now nearly all of the hostile forces have surrendered.

There is now a demand for the services of Mr. Heney in several cities of the Far West. In some other cities, not in the West, the work of such a man is needed. If he could have been employed in Philadelphia, the reform movement there would have been saved from failure by the punishment of members of the King. At Harrisburg, now, a Heney is needed to point out and bring to justice the real beneficiaries, "higher up," of the millions improperly expended in furnishing the new Capitol.

Theodore Tilton

THEODORE TILTON died in Paris last Saturday in his seventy-second year. Almost immediately on his graduation from college he was attached to the editorial staff of THE INDEPENDENT, associated in the daily work of the office with Dr. Joshua Leavitt. On the withdrawal, soon after, of Dr. Leonard Bacon (whose brilliant son, Leonard Woolsey, also died last week), Dr. Richard S. Storrs and Dr. Joseph P. Thompson from the editorial control, Mr. Beecher was asked to take the chief editorship; but his relation, apart from a weekly article with his name, was little more than nominal, and before a great while his young protégé, Mr. Tilton, was to all practical purposes chief editor. In the early part of the Civil War Mr. Beecher withdrew entirely and left Mr. Tilton in command. So he continued until 1870, when the proprietor of the paper, Mr. Henry C. Bowen, was obliged to dismiss him because of his radical views, and to transfer him to *The Brooklyn Union*, which Mr. Bowen then controlled. THE INDEPENDENT, which had been started as the organ of the progressive wing of the Congregational denomination, and as an opponent of slavery, had become an undenominational religious journal with the advent of Mr. Beecher as editor. Mr. Tilton associated with him as managing editor Mr. Oliver Johnson, an intimate friend of William Lloyd Garrison, and a pronounced radical in religion. The paper, as they conducted it, became so pronounced in its radicalism that it offended its supporters, and the withdrawal of Mr. Tilton and Mr. Johnson became necessary. Mr. Tilton's sharp criticisms of the conduct of the war and of President Lincoln had earlier made a breach with Mr. Beecher and Mr. Bowen.

Of Mr. Tilton's career subsequent to his leaving THE INDEPENDENT we need to say little. He engaged in various editorial ventures with no great success.

He came to the front for a season thru his suit against Mr. Beecher for alienating his wife's affections. Mrs. Tilton confessed guilt before the trial, denied it at the time of the trial, and again admitted it afterward. The jury disagreed. That ended Mr. Tilton's career. He went to Europe, lived mostly in Paris, was supported in large part by friends, played chess, and wrote poetry which had no great vogue. A very brilliant young man, very ambitious, very jealous of Mr. Beecher's superior popularity, he had shot his bolt, and was content to live and die in utter obscurity, hidden away from all but a very few of his old friends.

A very brilliant young man we have said Mr. Tilton was. He was over six feet tall, very handsome, with long light hair flowing down to his shoulders, therein imitating Mr. Beecher, who was his first model. He was an unusually attractive speaker, and Mr. Beecher encouraged him, going so far, even, as to engage in a public debate with him on a popular subject in Plymouth Church. As speaker and editor he had the ear of the nation, and his double-leaded editorials on public questions were eagerly looked for. There was no more admired lecturer on the boards at a time when lectures were most popular. It was in those youthful days that he wrote a few poems that were much quoted, such as "Toll, Roland, Toll," "A Layman's Profession of Faith" and "God Save the Nation." But his growing inordinate conceit was in part his ruin. He lacked balance, dabbled in strange and abnormal social theories, became a disciple of Victoria Woodhull and printed a most absurd booklet giving an account of her miraculous performances and defending his vagaries. That was fatal to his reputation for sober judgment, even before he felt that he had been wronged in his own home. But even there it was rather the vindictive jealousy of Mr. Beecher's fame as a public man than of any private wrong which inspired his hostility and public attack; and it was first thru his intimate friend, Mrs. Woodhull, that he disseminated the public scandal. Mr. Beecher was a much abler man than he, had a vastly saner mind, and was supported by very numerous and devoted friends; and when Mr. Tilton found that he could not drive Mr. Beecher from the pulpit, compelling him to "step down and out," he lost his courage and fled his country. We do not know another so sad and complete a collapse and wreck of an extraordinarily promising career, but the failing sanity of judgment and the weakened courage found sufficient explanation in the inordinate conceit and self-praise which followed his meteoric juvenile popularity and fame. He had extraordinary talents, but he lacked balance, and that stamina of character which ensures persistence and permanent success.

The Grub and the Butterfly

ARGUMENT on social questions would be a dull thing if it were not for the lower animals. The zoologists supply the ammunition for the sociologists to throw at each other. No sooner is a new organism discovered, even if it's nothing more than a polyp or a microbe, than some reformer holds him up as an example to us. A hundred years ago Mandeville, not to mention earlier writers, showed in his "Fable of the Bees," how easy was this method of argumentation, and it has been popular ever since. "Go to the ant, thou sluggard, consider her ways and be a socialist" say some. "Ape your ancestors and live on nuts and fruit you pick from the trees," cry others. "What was established by the primordial protoplasm cannot be changed by act of parliament," thunders the biological dogmatist.

It is in the duel of the sexes that the zoological method finds freest scope. Somewhere in the animal kingdom you can find an analogy for anything you want to substantiate. The women take to spiders, the men bank on birds. They "learn about women from them." The arguments are irrefutable since neither party pays any attention to the examples adduced by the other. And in this they are quite right. Mollusca, protozoa and hymenoptera are no fit models for us. The only thing we need to consider is a particular species of primates and we cannot learn very much from their past history because the application of the term *sapiens* to the whole species

is an unwarranted generalization. It does not make any difference to us what "nature intended" even if we knew. We shall do as we like anyway. The time spent in trying to find out what nature intended is largely wasted. We would make more progress if we devoted that time to finding out what nature will let us do. Man's principal business, ever since he attained to manhood, has been repealing the laws of evolution, long before he discovered them. Man's superiority over the lower animals lies in the fact that he can change his mind.

That is why it is so difficult to trace his curve and calculate his eclipses. We are, therefore, skeptical of the success of such attempts as Mr. Finck makes in this issue to discover immutable law in anything so capricious as fashions in clothing. We certainly hope he is right in concluding that women will never dress like men, meaning by that adopting man's present costume. Whenever they have taken to themselves any articles of masculine apparel it has generally been those that men want to get rid of. They show bad judgment in their selection. A few years ago they took to derby hats, stiff linen collars and imitation shirt bosoms. What they should borrow are pockets and practicable buttons.

The real object of reactionaries like Mr. Finck is to bifurcate the human race into distinct sub-species; one sex to be useful and the other ornamental. That is why they insist that the conventions of dress, which are adopted to enforce this differentiation, have "been established for all time." They, therefore, would impose upon women forever a garb unsuited to active out-of-the-home work, in the way the convicts in our penitentiaries are compelled to wear striped clothing to prevent their escaping. In the same way the Chinese cripple the feet of their women so they will stay at home. Our American mandarins insist on applying the compression in a more vital part of the anatomy in order more effectually to check women from wandering into forbidden paths. Really these precautions are unnecessary. Women are willing enough to stay in the home if they are treated decently. It is easier to keep a wife in the house than a cook or chambermaid.

Women in all ages have done a large proportion of the world's work, but they have usually got neither pay nor credit for it. That was because their husbands were their sole employers and they could not strike. But now they are finding out that they can get better pay and more privileges in extra-mural occupations, and they are taking advantage of it. This is inevitable and under the circumstances desirable. The labor of housekeeping is daily lessening, and Satan finds some mischief still for idle women to do. Now the 4,833,530 women engaged in gainful occupations in the United States are all doing their work more poorly and at greater expenditure of strength because of the hampering costume which society compels them to wear. The men allow the women to compete with them in the race of life provided that they run a sack-race and have half their supply of oxygen cut off. Even under these handicaps their competition is complained of. We refuse to regard this as one of the immutable laws of nature.

Almost equally repugnant to us is Mr. Finck's dictum that men's costume shall be purely utilitarian and ugly. "Dressing is one of the fine arts, the one art in which men can never compete with women," he says. But most of the fabrics and gowns he gloats over were designed by men. It is true women made these silks and satins—that is, they did the drudgery, the tedious tending of the spindles and looms—but men did the pretty and easy work, the esthetic. At present, men are content to load the products of their artistic and creative genius on the backs of their women, but we believe that this remarkable unselfishness will not always continue. Men may in time adopt colors and fine fabrics, even tho it imperils the law of evening dress, which was established by the Medes and Persians. To adopt the entomological argument, the grub becomes the butterfly.

It is not desirable that men and women should dress alike. It is not desirable that any two individuals of the same sex should dress alike. All that is needed is a little more freedom from the tyranny of fashion. People have more sense and better taste than they are credited with.

and if they have a chance to exercise it they will devise costumes that are both convenient and beautiful. There would be many eccentricities and absurdities, but at least no single individual would invent anything so bad as the present full dress of men and women. He could not. It takes the collective stupidity of generations to do that.

The End of Irish Devolution

THE overwhelming majority of the British Government in the House of Commons has again been balked and beaten, not this time by the House of Lords, but by the Irish people. It is a most unexpected defeat, a failure just at the moment of expected success.

The Government had consulted fully with the Irish leaders in Parliament, and had every reason to expect their support. The plan was not Home Rule in the way of legislation, for it established no Irish Parliament; but it was Home Rule to a very great extent in administration, and was the acknowledged step toward greater concessions. It was all that the members of the Government could themselves agree upon, for, altho the Prime Minister would have been willing to go, perhaps, as far as Gladstone went, his associates would not. The attempt would break up the Cabinet. It was believed that this moderate measure of self-government, this progressive devolution, would yet be rejected, not by the Irish members themselves, but by the House of Lords. That rejection would fill up the measure of the sins of the Upper House, and would give proper occasion to appeal to the country on the demand to end or mend the Lords. It was a very pretty scheme, but it has been completely blocked by those who would most have benefited by it, by the Irish people themselves—not by their wiser leaders in Parliament, like Mr. Redmond, but by the noisier vociferations of radical leaders appealing to the passions of the people.

But Ireland is in a better condition than it was ten years ago, and can better afford to be foolish. The enemies of Irish reform will say that the people cannot be hungry who would refuse half a loaf. They cried, Give us Home Rule complete, or give us nothing. We can go half way toward it, said Campbell-Bannerman, and will go further as soon as we can. No, said the Irish irreconcilables, we will go the whole distance, or we will not take a step. We would rather that England should rule us altogether than that she should rule us only in part. There is no logic, no sense, in such a decision, but it is Irish. The sensible way is to take what you can get, and so be in a better position to get more. But the foolish counsel, as so often is the case, took with the people, and the leaders like Mr. Redmond had to reverse their judgment in a hurry, in fear that they would be displaced by ambitious rivals. It was ingratitude, and appears to have been treachery. Even religion was called to the support of the popular side, for the priests feared to allow public education to be put in the hands of the people. They remembered France.

This is as severe as it is unexpected a blow to the Liberal Government. The Irish bill will be withdrawn. Both the great measures on which it depended have been defeated, and there is no domestic legislation to show. The ultimate purpose in view, the discrediting and reorganization of the House of Lords, has failed. What the Cabinet can now do is not clear. The Welsh disestablishment may be taken up, and a special commission, just now disintegrated, was appointed to investigate conditions in Wales that needed no investigation, for everybody knows what they are. Perhaps such a bill might pass the Commons, and it might even be allowed, unwillingly, by the Lords; but if it is not prest the Nonconformists will be as angry as are the Irish, and the Liberal Parliament will be compelled to dissolve, with every likelihood that another six years will follow of Tory rule. That would be a very unfortunate condition, for it would endanger the generous and just policy in South Africa. In the matters which concern Great Britain and all foreign policy the present Government has done admirably. It has given peace and home rule to the lately rebel colonies in South Africa; it has shown vigor in the dangerous unrest in India; it has made a new convention with Japan to ensure peace in the East; it has healed the breach with France, so that she is a

strong ally instead of a foe; it has made Spain a close friend; it has led the international politics of Europe and all the East; and this has been done by a Liberal Government, such as has been sneered at as devoted only to a Little England. It is a malicious fortune which makes this Government, led by England's wisest statesman, fail at home, where its plans and purposes were the wisest and most generous. But an old Greek proverb reminds us that Zeus himself cannot guard against the vagaries of the irresponsible. Let a Tory Government now succeed, and Ireland may have long years in which to blame her leaders who refused to take what they could get, because they could not have all they wished.

The Wealth of the White Cornettes

A CATHOLIC pastor, in all sincerity as well as in a spirit not at all unfriendly to THE INDEPENDENT, of which he is a subscriber, complains that in the editorial, "The Ecclesiastical Quid Pro Quo," the statement declaring that "the total property of the Sisters of Charity, known as the 'White Cornettes,' . . . must reach about $70,000,000," is a glaring exaggeration, and he demands the authority for our statement. He adds the accessible statistics of this sisterhood as 37 hospitals, 28 orphan asylums, 14 infant asylums, 5 industrial schools, 6 asylums and schools, 5 insane asylums and 33 parochial schools, which last belong not to them.

Accepting these statistics as complete and correct, and capitalizing on a basis of 5 per cent., the following are the results:

37 HOSPITALS.

Average number of patients in each.	100
Average weekly charge, $20; yearly	$1,000
Yearly receipts of each	100,000
Of the 37	3,700,000
Capitalized, at 5 per cent.	75,000,000

N. B.—As far as we know, but one hospital is free—Charity Hospital, New Orleans, La.

Granting the figures are too high, because clergymen and sisters are charged about $7 weekly, and also there are a few pauper cases, let us divide by half—*net*, $37,500,000.

28 ORPHAN ASYLUMS.

Average number in each	50
Average number in all	1,400
1,400, at $70 each	$98,000
$98,000, capitalized at 5 per cent.	1,800,000

The Sisters of Charity in New York tax a pastor $70 yearly for every orphan from his parish—*i. e.*, over and above government grants:

14 INFANT ASYLUMS.

Average number of inmates in each.	50
Average number of inmates in all.	700
700, at $50 yearly for each	$35,000
$35,000, capitalized at 5 per cent.	700,000

5 INDUSTRIAL SCHOOLS.

Average number of pupils in each	50
Average number of pupils in all	250
Earnings and grants, each	$100
Earnings and grants, all	25,000
$25,000, capitalized at 5 per cent.	500,000

6 ASYLUMS AND SCHOOLS.

Only one school—St. Joseph's Academy, Emmettsburg—hence:

5 asylums, average 50	250
Average grant, $50 yearly	$12,500
$12,500, capitalized at 5 per cent.	250,000
St. Joseph's Academy—	
About 100 pupils, at $200	20,000
$20,000, capitalized at 5 per cent.	400,000

5 INSANE ASYLUMS.

Average number of inmates	200
(Mt. Hope, Baltimore, has over 600.)	
Average charge, weekly	$20
Average charge, yearly	1,000
1,000 inmates, at $1,000	1,000,000
$1,000,00, capitalized at 5 per cent.	20,000,000

33 PAROCHIAL SCHOOLS.

Average number of teachers in each.	10
Average number of teachers in all	330
Average yearly salary for each	$300
Average yearly salary for all	99,000
$99,000, capitalized at 5 per cent.	1,980,000

RESUME.

Institutions.	Capital.
37 hospitals	$37,500,000
28 orphanages	1,800,000
14 infant asylums	700,000
5 industrial schools	500,000
6 asylums and schools—	
5 asylums	250,000
St. Joseph's Academy	400,000
5 insane asylums	20,000,000
33 parochial schools	1,980,000
Total	$63,130,000

In other words, the annual returns of these 128 institutions bespeak a capital equal to about $60,000,000.

Our averages both in figures and moneys are low. But our readers must notice that we pass over all the expenses, which probably are three-fourths of the

receipts. We neglect them deliberately, for they are met and well met by:

(*a*) Church collections at Easter, Pentecost, Christmas and other times.

(*b*) Concerts, theatricals, eucher parties, bridge whist, fairs, bazars, school commencements, etc.

(*c*) Donations, great and small.

(*d*) In the South, school fees.

(*e*) Systematic begging.

So far we have given the earnings. To these are to be added the endowments and legacies: The Carney of Boston, the Whiteford of Baltimore, over $200,000; the Gregg of Richmond, about $100,000. Legacies, large and small, flow steadily into the Cornette coffers.

Finally come the very large sums in money or its equivalent brought by girls on entering the order. Daughters of wealthy Catholic families; a sister of a former president of the Adams Express Company; a sister also of one of its vice-presidents, etc.—$70,000,000 capital is below the mark; far below the mark, we believe.

Connected with these finances is the tax levied annually by the Mother House in France upon the American branch. Let us suppose it is $5 a head, and assuming there are at least 5,000 Cornettes —a very low figure—there results a drain of $25,000 yearly out of the country.

Lastly, the branch houses in the United States are taxed to support the Novitiate at Emmettsburg. The *pro rata* we know not. The large properties, however, of the Novitiate have not been included in our tables.

In the ordinary way in which valuation of a financial corporation is made, we would appear to have substantiated what was a merely incidental statement, based on some knowledge. Of course, we do not assert that the Cornette Sisters of Charity own $70,000,000 in visible real and personal estate. If they did, and other orders were equally rich, we should fear the condition in France and Italy. Those who ought to know have assured us that at the present moment one-third of Rome is owned by the Church and her Orders, and such a condition of increasing unprofitable mortmain is disturbing to Italian politics. We have no such speedy danger in this country. Yet at a synod held a few years before his death, Archbishop Corrigan, of New York, warned his priests to stop talking publicly about the value of churches and church institutions. He probably feared a popular movement against all State or city aid to sectarian institutions. Some States have constitutional provisions forbidding it.

The Mohonk Conference

THIS has been a great twelvemonth for peace congresses. Last summer the Interparliamentary Union held its session at London and the International Peace Congress at Milan. This spring we have had at New York the National Arbitration and Peace Congress—the most eminent unofficial gathering ever held in the United States, and last week, on the shores of the beautiful mountain lake, occurred the thirteenth annual Mohonk Conference of International Arbitration.

These Mohonk Conferences have been the source of inspiration to most that has been accomplished in America during the past decade for international peace. Mr. Smiley has been singularly fortunate in attracting to them the most eminent leaders in American thought and action. No wonder when such a gathering spends three days and nights together in as secluded and delightful an intimacy as if they were on shipboard, a public sentiment for peace is engendered that eventually affects the whole nation. It was a rare inspiration of Mr. Smiley's to gather together the conscience of America each spring in apple-blossom week, at one of the most beautifully situated hotels in the land.

As was to be expected, this year's conference was devoted largely to the second Conference at The Hague, which assembles the 15th of this June. Altho separate sessions were devoted to the place of education in the arbitration movement, what business men can do for peace, and the Pan-American interest in internationalism, almost every speech referred to the coming Congress of the World. Perhaps the most statesmanlike paper was the opening address of Nicholas Murray Butler, who presided over the Conference. It showed that Presi-

dent Butler is one of the few men who are familiar with the history and philosophical implications of that movement which would substitute law for war. Altho he held that the time is not yet ripe for the nations to take action as to the limitation of armaments, he thought it was entirely feasible for the coming Hague Conference to transform the Hague Court "from a semi-diplomatic into a truly judicial tribunal" by the substitution of judges for arbitrators. He also urged that the Hague Conference should hereafter assemble automatically and periodically, for in such a stated conference "lies the germ of the international parliament which will one day come into being." The readers of THE INDEPENDENT need not be told that we have urged this idea in season and out for several years. It is the most fundamental question that can come before the Hague Conference. President Butler also endorsed the suggestions of Secretary Straus, Mr. Bryan and James Speyer, that no neutral nation should render financial aid to belligerents, and he ended his address by making the interesting suggestion that our ex-Presidents and ex-Secretaries of State should hereafter constitute a salaried, permanent body to represent the United States at all important international conferences. This seems to us a happy solution of the question of what to do with our ex-Presidents.

The other addresses were of uneven merit, as is usual in all such large and protracted assemblages. Special mention must, however, be made of Andrew D. White's long and able address. It was a distinct disappointment, however, on account of its extreme conservatism to those who hoped that the man who has done such splendid work in the creation of the Hague Court should have failed to see that there are just as great possibilities before the second Hague Conference as there were before the first.

The platform of the Conference contains the following recommendations to the Hague Conference as being the most immediate and important for its consideration:

(1) A provision for stated meetings of the Hague Conference.

(2) Such changes in the Hague Court as may be necessary to establish a definite judicial tribunal always open for the adjudication of international questions.

(3) A general arbitration treaty for the settlement of international disputes.

(4) The establishment of the principle of the inviolability of innocent private property at sea in time of war.

(5) A declaration to the effect that there should be no armed intervention for the collection of private claims when the debtor nation is willing to submit such claims to arbitration.

We commend, in accordance with our resolution of last year, the consideration by the Hague Conference of a plan for the neutralization of ocean trade routes.

It will be noted that there is no reference in the platform to the question of the limitation of armaments. This was the only subject upon which the delegates sharply differed. Indeed, the subject was only dropt after an exciting debate and by an exceedingly narrow majority. As the Interparliamentary Union and the International Peace Congress and the New York Peace and Arbitration Congress, as well as the United States and British governments, have all declared for the discussion of the limitation of armaments at the forthcoming Hague Conference, many feared that the ignoring of this question might be misconstrued in many quarters, especially as last year's Mohonk Conference had declared in favor of it. Still, if the debate at Mohonk had not been prematurely cut off, there is no doubt that some compromise would have been reached whereby the question of disarmament could have been put in the platform without offending the "practical" majority. At all events, the increase of armaments cannot continue with accelerating speed much longer. The statesmen of the world have got to face it soon. Perhaps the wisest thing would be for the coming Hague Conference to appoint a commission of experts to consider the question and report back to the third Hague Conference.

It is interesting to compare the Mohonk platform with the platforms of the National Arbitration and Peace Congress at New York, the Interparliamentary Union at London, and the International Peace Congress at Milan. The only plank that they all have in common is that the Hague Conference should hereafter assemble automatically and period-

ically. All of them except Mohonk urge the discussion of the question of disarmament; London, New York and Mohonk declare for the immunity of private property at sea; Mohonk and Milan stand for the neutralization of trade routes and a general treaty of arbitration; Milan and London demand an appropriation for peace propaganda on the part of each nation proportionate to the military budget; New York and Milan desire that the Hague Court shall be open to all nations; and London and New York second Mr. Bryan's proposition that mediation be resorted to before hostilities commence. Other questions, such as the codifying of international law, the punishment of nations that refuse to abide by awards, the definition of contraband of war, the prohibition of the use of new types of guns, the definition of the rights and duties of neutrals, and the question of armed intervention for the collection of private debts—each one of these received only the attention of a single congress.

If the second Hague Conference shall solve any one of these questions it will have justified itself. But it will be a great disappointment if it does not provide for its automatic and periodic assembling.

A Wise Legacy

At the dinner of the Alumni Association of the Law Department of New York University, the Hon. Walter Lloyd Smith, of Elmira, N. Y., Presiding Justice of the New York Supreme Court, Appellate Division, Third Department, read the following, as "a remarkable will made by a man who died in the Cook County Insane Asylum, at Dunning, Ill.":

I, Charles Lounsbury, being of sound mind and disposing memory, do hereby make and publish this, my last will and testament, in order as justly as may be, to distribute my interest in the world among succeeding men.

That part of my interest which is known in law and recognized in the sheep-bound volumes as my property, being inconsiderable and of no account, I make no disposal of in this my will.

My right to live, being but a life-estate, is not at my disposal, but these things excepted all else in the world I now proceed to devise and bequeath:

Item: I give to good fathers and mothers, in trust for their children, all good little words of praise, and encouragement, and all quaint pet names and endearments, and I charge said parents to use them justly and generously, as the needs of their children may require.

Item: I leave to children, inclusively, but only for the term of their childhood, all and every, the flowers of the fields, and the blossoms of the woods, with the right to play among them freely, according to the customs of children, warning them at the same time against thistles and thorns. And I devise to children, the banks of the brooks, and the golden sands beneath the waters thereof and the odors of the willows that dip therein, and the white clouds that float high over the giant trees. And I leave the children the long, long days to be merry in, in a thousand ways, and the night and the moon and the train of the milky way to wonder at, but subject, nevertheless, to the rights hereinafter given to lovers.

Item: I devise to boys, jointly, all the useful idle fields and commons where ball may be played; all pleasant waters where one may swim; all snow-clad hills where one may coast, and all streams and ponds where one way fish, or where, when grim winter comes, one may skate; to have and to hold the same for the period of their boyhood. And all meadows with the clover blossoms and butterflies thereof; the woods and their appurtenances; the squirrels and birds, and echoes and strange noises, and all distant places which may be visited, together with the adventures there found. And I give to said boys each his own place at the fireside at night, with all pictures that may be seen in the burning wood, to enjoy without let or hindrance and without any incumbrance of care.

Item: To lovers, I devise their imaginary world with whatever they may need: as the stars of the sky; the red roses by the wall; the bloom of the hawthorn; the sweet strains of music and aught else they may desire to figure to each other; the lastingness and beauty of their love.

Item: To young men, jointly, I devise and bequeath all boisterous, inspiring sports of rivalry, and I give to them the disdain of weakness and undaunted confidence in their own strength. Tho they are rude, I give to them the power to make lasting friendships, and of possessing companions, and to them exclusively I give all merry songs and brave choruses, to sing with lusty voices.

Item: And to those who are no longer children or youths or lovers, I leave memory, and I bequeath to them the volumes of the poems of Burns and Shakespeare and of other poets, if there be others, to the end that they may live over the old days again, freely and fully, without tithe or diminution.

Item: To our loved ones with snowy crowns I bequeath the happiness of old age, the love and gratitude of their children until they fall asleep.

The significance of this "will" is lost and it becomes merely a curiosity if we

place the emphasis upon the fact that the author was an inmate of an insane asylum.

As the "will" stands it is a stronger indication of the insanity of the world than it is of the testator's. For the first time since men learned to outwit each other and to cheat posterity by taking little liens upon the common estate, somebody has thought to return the heavens and the earth to the rightful owners. The instrument would not stand in law, but no decision of a court could break it. For it is really meant for an enchantment which only children and saints, and a few wise men and vagabonds would understand.

And what a commentary it is upon the average will, which often so grudgingly and suspiciously doles out the testator's estate! There are no conditions here to intimate a doubt of the worthiness of the legatees or their right to enjoy the gift. The maker of it has changed the very formulas of Socialism into high poetry, hallowed good fathers and mothers and their children, all youths and lovers and old people with his confidence and love.

Never before have children received such a legacy or one so fitted to their nature and needs as this, "All and every flower of the fields and the blossoms of the woods, *with the right to play among them freely, according to the customs of children.*" This last clause, added like a tender codicil, shows the miracle of understanding. We have almost forgotten that children have "customs" of their own, as different from the uninspired ways of grown people as the wings of birds are different from the arms of men. We torture and compress their young spirits into nurseries and ugly back yards and alleys and streets and prim parks. Only once in a long while do they manage to achieve a few little things on the sly "according to the customs of children." And thousands of them never enter upon their rightful inheritance of the woods and fields. It is no wonder that so many of them grow up perverted into trust magnates or that they should commit suicide or go insane. As if to ensure their happiness beyond any chance, this will leaves "in trust to good fathers and mothers, all good little words of praise and encouragement, and all quaint pet names and endearments, and I charge said parents to use them justly and generously *as the needs of their children may require.*"

If every man had the spirit of giving which characterizes the maker of this will, we should have less need of so much dollar-marked charity. For when all else is given this fact remains—*we* are the legacies to those who come after us. And the great givers are those who shall confer love, and the good little words of praise to needy childhood, who concede to lovers the whole world for an enchantment, and to young men "the disdain of weakness," and to the old pleasant memories. It is poetry, of course, and we are not yet high enough in the scale of things to take our legacies in this form, but that is our fault, not the testator's. It takes a very rich man to bequeath the Milky Way among other items to "succeeding men," but this man who died in the Cook County Insane Asylum had somehow got a fee simple to the universe, and it is his manner of disposing of it which is worthy of attention.

Which Is True?

Who is responsible at the Vatican for its French policy? We turn for information to the Roman correspondents of two leading Catholic papers in this country. One says:

"Admitting that Cardinal Merry del Val lacks diplomatic experience in the duties of his post and does not fill it, the Church is governed by the Pope and Sacred College, not by the Secretary of State.

"Every step taken by the Holy See in the conflict with France was discussed by the Congregation of Extraordinary Ecclesiastical Affairs, which is composed of seventeen cardinals, among whom are Oreglia, Rampolla, Satolli, Mathieu, Gotti, the two Vannutelli. Cardinal Merry del Val is the junior member of this congregation. It is a mistake to consider the papal Secretary of State as the minister of foreign affairs of the Holy See. The real papal foreign office is the Congregation of the Propaganda Fide, which is quite independent from the Secretariat of State. The Secretary of State is the official who comes in contact with the members of the diplomatic body of the Holy See, and it is sufficient that he be a good linguist. He is responsible to the Pope alone, but is not held responsible for the policy of the Holy See, as this is in the hands of the Sacred College."

That is clear enough. Now read what

the other correspondent, equally wise, says:

"First, it is perfectly well known at Rome that the Cardinals have not been the Pope's counselors in policy from the beginning of his reign. They did not offer themselves as such, and he did not consult them.

"Next, the protest of the Holy See about President Loubet's visit to Rome, whence the quarrel between Rome and France began, was drawn up without consulting any Cardinals except the Secretary of State.

"Then, neither Cardinals nor the Congregation of Extraordinary Ecclesiastical Affairs have been consulted during the quarrel. The Pope acts alone with the aid of his secretary."

Now, which statement shall we believe? Both come with authority, and they diametrically contradict each other. We do not know, but they indicate what is the value of the information distributed from Rome.

Could Money Do It?

When Madagascar, in the person of the Prime Minister of its Queen, was visiting Great Britain and the United States, supplicating the two nations to deliver their country from the demands of France, it seemed that the most interesting experiment of a self-governing and developing negro nation might have been saved if some Carnegie had then appeared who could satisfy the French demands. We do not suppose it would tax the wealth of a Rockefeller to buy up the interests of King Leopold and all his subsidiary companies in the so-called Kongo Free State, and we are not clear that this would involve international complications, but it might be the greatest of blessings to that unhappy country. In 1890, when Leopold, who claimed all the country as his own, was in financial straits he borrowed $5,000,000 of the Belgian Government, and made public his will giving the Kongo to Belgium. But he has since added codicils and made concessions and reservations in perpetuity without consulting the legatee. Now Belgium is deliberating whether to take the Free State and its obligations without waiting for Leopold's death. Yet in the plan proposed there are immense domains reserved as his own, all this, of course, with no regard to the prior rights of the people, for not even treaties of purchase are made with them, as with our Indian tribes; but, on the contrary, they are taxed for the favor of being ruled, the hut tax and the rubber tax. Among the concessions are the Mining Union of the High Katanga, of $2,000,000 capital; a Lower Kongo Railroad Company, with mining rights and only $400,000 capital; an American rubber company, and an International Forest and Mining Company of $700,000 capital, of which Thomas Ryan is a large owner. Probably nearly all the country has thus been farmed out to companies in which Leopold is heavily interested. One of these days, possibly, benevolent money may fight selfish money; in fact, it does now to a great extent thru missionary and educational agencies, but it has a hard task when it has to fight, as in the Kongo, a rapacious government.

Bishop Satterlee's Remedy

Bishop Satterlee's address to the Episcopal Convention in Washington had to do in part with the failure to bring the negro into that Church. It is not strange, if his repeated characterization of that race expresses the usual attitude. He spoke of them as "a subject race," "morally and intellectually weaker" than other races. He says "the country has given them the right of suffrage, making them the equals of the whites when they are not their equals"; and he approves the statement that the negroes "are led astray by mere delusions as to the way in which the difference between a stronger and a weaker race may be overcome," such as "standing for their political rights," "becoming householders," "buying land," "the possession of wealth," and "being educated in schools and colleges"; and he concludes that, "even if they should become great landowners, men of wealth and men of education, race antagonism would only become stronger and more clearly defined." His remedy is—more negro clergy and a negro bishop! A better remedy would be, a less supercilious attitude from the Episcopal bench.

A Mystery Play

It is now an accepted fact among all competent teachers of theology that we must interpret Genesis story of the Fall of Man as something

less than a literalistic account of a historical series of occurrences. The very designations of the tree of life, and the tree of the knowledge of good and evil, imply a figure which was semi-conscious to the writer or compiler. The terms given by way of explanation have been various, poetry, parable, drama, myth; but perhaps never better expressed than by Dr. Inge, the new Lady Margaret Professor of Theology at Cambridge University, England, who, in an article on "Sin and Modern Thought," in *The Interpreter,* calls it a mystery play, and thinks that Paul went too far, for our times, in basing an argument on the fall of man from pristine holiness. He says:

> "Is it or is it not a divinely certified truth that the life history of the human race includes a moral catastrophe which reduced to ruins a noble and complete work of God? . . . We must frankly take our choice between the Pentateuch and modern science—between the theory of a ruined human nature and the theory of a gradual development from lower forms. The narrative of the Fall is valuable as a dramatic representation—a mystery play—of the psychology of temptation."

That the Genesis story gives the psychology of temptation is true. It shows how each sin, the first and the last, is the yielding to temptation and disobedience to the law of God, and leads to death. The drama of it, given to an early and unscientific age, can hardly be better described than as a mystery play.

We put very little faith in the new specific for the opium habit, but its success in the region of Singapore equals that claimed here for Christian Science. As a result, the importation of opium in the Malay States has been reduced from 80 to 50 chests per month, and thousands have been cured. The plant is a climber, botanically called *Combretum Sondaicum.* A decoction of the plant is put into two bottles, into one of which is added as much burnt opium as the patient is accustomed to use in a day. When he craves opium he is given two tablespoonfuls from the latter bottle and as much from the other bottle replaces it to fill the space. This is repeated when called for, but no new opium is added. The patient is cured in from ten to fifteen days. It looks like a plan for "tapering off," with the assurance that the medicine does it.

The public debt of the United States looks big, for it is $964,000,000. But in 1864 it was $2,679,000,000, nearly three times as much. Then the per capita indebtedness was $76.98, while now it is but $11.46. Then the annual interest charge was $4.12 per capita; now it is but 28 cents. The reduction of the debt should be a constant purpose, and 28 cents apiece is not a heavy charge, even if we double it by adding the cost of collection.

The capture and removal from Korea to Japan of a whole ancient pagoda was not a pretty act on the part of Viscount Tanaka. He went to Seoul on a message of official courtesy, and he used pressure to get a forced consent. It was not a generous, not a decent act, and Japan ought to require it to be returned and restored. Such acts support the contention that Japan is ruling Korea with great severity.

We have had the defense, and now we have the prosecution in the case of the Brownsville shooting. The white citizens and the negro soldiers contradict each other absolutely, and there is tall lying on one side. Sufficient appears to show that the President was justified in his action on the evidence brought to him; but it looks as if there would be neither vindication nor conviction.

The long awaited revision of the tariff approaches. The Massachusetts leather men led the way. Now the manufacturers of the country, in conference assembled, vote that they want revision. Speaker Cannon no longer stands pat. The President is not averse. The Dingley tariff has stood untouched long enough, and it is time for the people to have some relief.

The wide distribution of railroad properties is shown by the fact that there are 45,000 stockholders of the Pennsylvania Railroad, and 21,000 of them are women.

Insurance

John R. Hegeman Indicted

By far the most important feature in insurance happenings last week was the indictment of John R. Hegeman, the president of the Metropolitan Life Insurance Company, for perjury and for forgery in the third degree upon several counts. These indictments were based on year-end transactions of several years ago, whereby the books of the Metropolitan Life were purged of certain collateral loans on December 31st, and these loans were repurchased by the company on the first business day of the year following. President Hegeman admitted the transactions before the Armstrong Committee. The confidence of the Board of Directors in the president of their company remains unshaken, however, and in a minute adopted by them, which has been widely published, they say in part as follows:

The facts upon which the indictments are based were disclosed with the utmost frankness by President Hegeman before the Armstrong committee. The report of that committee recited the facts without criticism. The facts are that some years ago at the end of each of several years the president sold collateral loans and repurchased them at the beginning of the succeeding year. In each case the evidence of the loan and the collateral therewith were delivered to the purchaser, who in each case gave a check to the order of the company, which check was deposited to the credit of the company and paid in due course of business.

The practice was not concealed from the Insurance Department; on the contrary, that department on two separate occasions, under two different administrations, was informed of it and made no criticism of it.

The charge is that the annual statements of the company were incorrect in that they reported cash instead of collateral loans. Yet it is not disputed that as matter of fact the cash was in the company's treasury and the collateral loans were not. Counsel advise the company that the legal title to these loans was not in the company on the last day of the year when the report was made, but was in the parties to whom they were sold.

No profit out of these transactions was made by any individual; no loss to the company arose out of them. In fact, every collateral loan was paid in full, with interest, when called, and the company has never lost a dollar thru that form of investment.

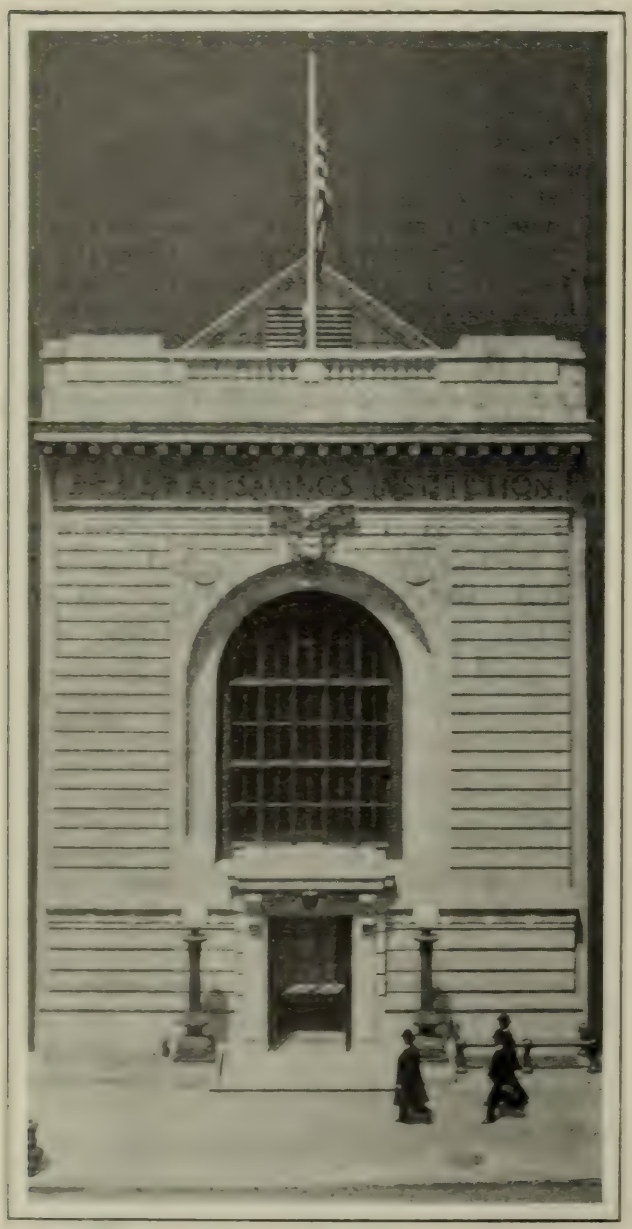
In view of these facts, the board places upon record an expression of its unreserved confidence in President Hegeman, of its recognition of the masterful work he has done in building up the company, and of its confident expectation that he will be vindicated from these charges.

GEN. BENJAMIN F. TRACY, one of the four members of the International Policy-holders' Committee elected to the Board of the Mutual Life Insurance Company, has finally signified his intention to accept his election and serve. Harlow N. Higinbotham has announced his refusal to serve. General Tracy, in explanation of his acceptance, said:

"In my opinion whether the gentlemen, members of the International Committee, nominated and elected on the administration ticket should accept or not depends entirely upon what they regard to be the wish of the policy-holders of the company. From the best information I have been able to obtain the policy-holders, with substantial unanimity, desire that the four gentlemen so nominated and elected should accept and serve.

"I know most of the members of the present board, and have known many of them for many years. I have complete and absolute faith in their fidelity to the trust committed to them, and gladly unite with them in the administration of the affairs of the company."

Policy-holders in the Mutual Life have again been warned by the company against selling or hypothecating their policies to speculators, who have no insurance interest in their lives.



ARCHIBALD C. HAYNES, a former general agent of the Equitable Life, in charge of the office at 25 Broad street, was last week elected president of the Mutual Reserve Insurance Company, vice Frederick A. Burnham, retired. George D. Eldridge was succeeded as vice-president by George W. Harper, formerly treasurer of the Mutual Reserve.

THE Preferred Accident Insurance Company, of this city, of which Kimball C. Atwood is president, was interested in the wreck of the Mystic Shriners' special train at Honda, Cal., on May 11th, to the extent of $2,500. It was owing to conservatism in company management that the sum was not greater, as the risk offerings were large, but the policy of the Preferred Accident has always been to decline excursion hazards, where such an accident as that which took place at Honda would pyramid losses.

Financial

The Broadway Savings Institution

THE Broadway Savings Institution, which was organized in 1851 by Peter Cumming, the late president, has recently moved into its new building on Park place. The presidents have been Francis P. Schoals, Francis A. Palmer and

FRONT ELEVATION OF BROADWAY SAVINGS INSTITUTION.
Photographed especially for THE INDEPENDENT.

Peter Cumming. The present executive is Horace F. Hutchinson, who entered the service of the bank more than forty-eight years ago as clerk and has been secretary and treasurer. The other officers are J. Berre King, first vice-president; J. A. Geissenhainer, second vice-president; Eugene Britton, treasurer, and Lincoln A. Stuart, secretary. The deposits are $10,250,000 and the surplus is $600,000.

....At a meeting to be held on June 18th, the stockholders of the New York County National Bank will vote upon a proposition to increase the bank's capital stock from $200,000 to $500,000.

....Railway gross earnings for April, according to returns in *Bradstreet's*, exceeded those of April, 1906, by 10,965,686, or 16 per cent. The figures indicate that the month's earnings were the best on record.

....Exports of iron and steel in the fiscal year ending next month will be about $175,000,000, against $57,000,000 ten years ago and $16,000,000 twenty years ago. For the ten months that ended with April the total was about $150,000,000.

....William A. Gaston, the well-known Boston lawyer and former candidate for Governor of Massachusetts, has recently been elected president of the National Shawmut Bank of Boston, whose capital stock is $3,500,000 and whose surplus and profits are $4,500,000. The deposits are $51,831,904 and total resources $71,393,082.

....Charles H. Sabin, recently vice-president of the National Commercial Bank of Albany, is the president of the National Copper Bank, which has recently been organized in this city. The directors include F. Lothrop Ames, Boston; James M. Beck, former Assistant United States Attorney-General; James C. Bishop, Redmond & Co.; Charles F. Brooker, president American Brass Co.; H. O. Havemeyer, Jr., American Sugar Refining Co.; James Jourdan, president Brooklyn Union Gas Co.; Adolph Lewisohn, president United Metals Selling Co.; William A. Paine, president Copper Range Consolidated Co.; Robert C. Pruyn, president National Commercial Bank, Albany, N. Y.; Henry H. Rogers, Jr., director Amalgamated Copper Co.; F. W. Roebling, president J. A. Roebling Sons' Co.; Charles H. Sabin, president; George R. Sheldon, W. C. Sheldon & Co.; R. M. Stuart-Wortley, Edward Sweet & Co.

The Independent

VOL. LXII NEW YORK, THURSDAY, JUNE 6, 1907 No. 3053

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Mr. Roosevelt's Railway Policy

Returning from the funeral of Mrs. McKinley, the President arrived on the morning of the 30th at Indianapolis, where, in the afternoon, he delivered a long address at the unveiling of the monument to Major-General Henry W. Lawton. In the beginning he spoke of the reunion of the blue and the gray, of General Lawton's character and services, and of Governor Morton, "greatest of all the war Governors who upheld the hands of Abraham Lincoln." Turning then to questions of the present time, he said:

"One great problem that we have before us is to preserve the rights of property; and these can only be preserved if we remember that they are in less jeopardy from the socialist and the anarchist than from the predatory man of wealth. It has become evident that to refuse to invoke the power of the nation to restrain the wrongs committed by the man of great wealth who does evil is not only to neglect the interests of the public, but is to neglect the interests of the man of means who acts honorably by his fellows. The power of the nation must be exerted to stop crimes of cunning no less than crimes of violence. There can be no halt in the course we have deliberately elected to pursue, the policy of asserting the right of the nation, so far as it has the power, to supervise and control the business use of wealth, especially in its corporate form. Today, I wish to say a word to you about the first and most important feature of this task, the control of the common carriers doing an interstate business; a control absolutely vested in the nation."

In his opinion, he added, it was probable that common carriers, in so far as they also transported the mails, even if their business was not interstate, were subject to Federal control, under that clause of the Constitution which empowers the National Government to establish post roads, "and therefore, by necessary implication, to take all action necessary in order to keep them at the highest point of efficiency." The Federal railway or corporation laws enacted in the last six years had all been "steps in advance in the right direction." All the Government's suits under these and pre-existing laws had been just and proper:

"There can be no swerving from the course that has thus been mapped out in the legislation actually enacted and in the messages in which I have asked for further legislation. We best serve the interests of the honest railway men when we announce that we will follow out precisely this course. It is the course of real, of ultimate conservatism. There will be no halt in the forward movement toward a full development of this policy; and those who wish us to take a step backward or to stand still, if their wishes were realized, would find that they had invited an outbreak of the very radicalism they fear. There must be progressive legislative and administrative action for the correction of the evils which every sincere man must admit to have existed in railroad management in the past."

There must be vested in the Federal Government, he continued, a power of supervision over the railways as complete as its power over the national banks—power to supervise the future issuance of stocks and bonds, with provision for "the frank publicity of everything which would-be investors and the public at large have a right to know":

"The Federal Government will thus be able to prevent all overcapitalization in the future; to prevent any man hereafter from plundering others by loading railway properties with obligations and pocketing the money instead of spending it in improvements and in legitimate corporate purposes; and any man acting in such fashion should be held to a criminal

accountability. It should be declared contrary to public policy henceforth to allow railroads to devote their capital to anything but the transportation business, certainly not to the hazards of speculation. For the very reason that we desire to favor the honest railroad manager, we should seek to discourage the activities of the man whose only concern with railroads is to manipulate their stocks. The business of railroad organization and management should be kept entirely distinct from investment or brokerage business, especially of the speculative type, and the credit and property of the corporation should be devoted to the extension and betterment of its railroads, and to the development of the country naturally tributary to the lines. These principles are fundamental."

Roads should not be forbidden to acquire connecting lines, but should not be allowed to obtain control of lines parallel and competing. They should, however, be "permitted and encouraged to make traffic agreements" previously approved by the Commission and made public in every detail. "The movement to regulate railways by law," said the President, "has come to stay." The people had made up their minds to exercise a closer control over all kinds of public service corporations. Every honestly managed railway would gain by this policy. "The men more anxious to manipulate stocks than to make the management of their roads efficient and honest are the only ones who have cause to oppose it." Criminals would be punished. "But we have no intention of confounding the innocent many with the guilty few by any ill-judged and sweeping scheme of vengeance; we sanction no legislation which would fall heavily upon innocent investors, instead of on the original wrong-doers or beneficiaries of the wrong." There should be no unreasonable restrictions upon the issuance of stocks and bonds, but inflation should be prevented:

"We favor the railway manager who keeps in close touch with the people along his line rather than in close touch with the speculative market; who operates his line with a view to the advantage he can legitimately get out of his railway as a permanent investment by giving a fair return to the stockholders and to the public good service with reasonable rates; who does not operate his road with a view to the temporary speculative advantage which will follow capitalizing an uncertain future and unloading the securities on the public. We wish to make it to the interest of the investor to put his money into the honest development of the railroads, and, therefore, we wish to discriminate against the man who, while enriching himself, lays upon the future owners and patrons of the road, and, above all, upon the honest men whose duty it may become to operate the road, a burden of additional debt without adding correspondingly to its actual worth."

Congress should enable the Commission to make a physical valuation of all the roads. There had been much wild talk as to the extent of overcapitalization:

"The census reports on the commercial value of the railroads of the country, together with the reports made to the Interstate Commerce Commission by the railroads on their cost of construction, tend to show that as a whole the railroad property of the country is worth as much as the securities representing it, and that in the consensus of opinion of investors the total value of stock and bonds is greater than their total face value, notwithstanding the 'water' that has been injected in particular places."

It was probably true that the real value of the whole was greater than the face value. Suspicion had been aroused by isolated examples of unconscionable stock-watering and kindred offenses. There had been "many instances of gross and flagrant stock inflation," but the cases of overcapitalization would not be found to impair the wholesome financial standing of the railroads as a whole. Physical valuation would be no panacea, nor a sufficient measurement of a rate, but it would be an essential instrument in administrative supervision, useful in determining the reasonableness of future capitalization and in protecting the roads as well as the public against the making of inadequate or unjust rates:

"The effect of such valuation and supervision of securities cannot be retroactive. Existing securities should be tested by the laws in existence at the time of their issue. This nation would no more injure securities which have become an important part of the national wealth than it would consider a proposition to repudiate the public debt. But the public interest requires guaranty against improper multiplication of securities in the future. Reasonable regulations for their issuance should be provided, so as to secure as far as may be that the proceeds thereof shall be devoted to legitimate business purposes. In providing against overcapitalization we shall harm no human being who is honest, and we shall benefit many, for overcapitalization often means an inflation that invites business panic; it always conceals the true relation of the profit earned to the capital invested, creating a burden of interest payments which may redound to the loss alike of the wage-earner and the general public, which is concerned in the rates paid by shippers; it

damages the small investor, discourages thrift, and puts a premium on gambling and business trickery."

By the new control over the accounts of railways he hoped that as complete publicity would be obtained as is seen in the case of national banks. The guaranty of Federal approval would tend to create public confidence in railway securities and to give the roads the additional funds they need. There would be no relaxation of the Government's effort "to get at any great railroad wrecker, any man who by clever swindling devices robs investors, oppresses wage workers and does injustice to the general public." Some had complained about recent official investigations. The Government, it should be remembered, was responsible only for turning on the light, not for the misdeeds which the light revealed. Only by the central Government could supervision and control be effectively exercised. "The bulk of our business is honestly done." Resentment due to wrongs disclosed should not draw the people into "an indiscriminate raid upon all corporations and all men of wealth." The public greatly needed, Mr. Roosevelt said, an enlargement of transportation facilities. Arbitrary and unwise reduction of rates might prevent the needed improvements by making it impossible for the roads to raise additional capital. Investors in railway securities should be allowed a return sufficient to cover all risks. Money required for the immense outlay needed for the removal of the causes of railway congestion could not be obtained without assuring to the investor a reasonable reward:

"We cannot get an improved service unless the carriers of the country can sell their securities, and, therefore, nothing should be done unwarrantedly to impair their credit nor to decrease the value of their outstanding obligations. It is plainly inadvisable for the Government to undertake to direct the physical operation of the railways, save in wholly exceptional cases, and the supervision and control it exercises should be both entirely adequate to secure its ends, and yet no more harassing than is necessary to secure these ends."

In conclusion, he remarked that all this was a matter of morals as well as of business. Local attorneys of railroads were warned to keep out of politics and to do business with legislatures openly and honestly. Blackmailers of corporations and those who submitted to blackmail were denounced. "Demand honesty—absolute, unflinching honesty—together with courage and common sense, in public servant and in business man alike."

Other Addresses

The President also delivered a long address on the 31st, at the Michigan Agricultural College, near Lansing, making a plea for industrial education and for bettering the condition of tillers of the soil. Our educational system, he said, was incomplete because it did not provide for industrial training. The American workingman had little cause for fearing the competition of pauper labor, but he was affected in the markets of the world by the competition of foreign highly skilled workmen. He dwelt at length upon the character and needs of rural communities, urging the promotion of all agencies for making their social life attractive. Farmers should co-operate among themselves and with the Government. They should combine to protect their industry. He pointed out what the education given at agricultural colleges should be, and also expressed his views as to the duties of women, the value of large families of children, etc. Speaking at the Capitol, he said we should set our faces like flint against predatory wealth and also against predatory poverty.——Senator Foraker spoke at Steubenville, Ohio, on the 30th, and his remarks were regarded as veiled allusions to the President's course. The people should decide, he said, and not be guided by somebody's policy. We should uphold the Constitution. If we should tolerate the idea that it could lightly be evaded, upon the theory that thereby the public interest would be served, we should soon be adrift, and "the man on horseback" would be due to arrive. But we had been fortunate in always having a patriotic and liberty-loving man in the White House. A President, he said, should trust the people to name his successor. If one should attempt to control the selection of his successor, it was possible to use the enormous power of Federal patronage in support of such an attempt.——At Gettysburg, Congressman Tawney, of Minnesota, deplored the sur-

render of their duties and powers by the States to the Federal Government, asserting that this was due to their own solicitation or consent, largely because they desired to avoid expense.——In New York, Governor Guild, of Massachusetts, spoke of loyalty to national ideals. We were passing, he said, thru a bloodless revolution whose end was equality of opportunity. Special privilege must be abolished.——At St. Louis, Secretary Taft made an address upon recent examples of national altruism, considering at length our dealings with the Philippines, Cuba and Porto Rico. ——Our Philippine policy was attacked, at Norfolk, Va., by Mr. Bryan, who also remarked that the enforcement of laws against rebates and passes had increased the revenue of the railroads.——Congressman Champ Clark, at Savannah, bitterly attacked Secretary Root, who, he said, had sought to corrupt justice at its fountain head by suggesting that the courts should be tampered with in order that the powers of the Federal Government might be strained and stretched to suit his ideas.——At the twelfth annual reunion of Confederate Veterans, in Richmond, a statue of Gen. J. E. B. Stuart was unveiled.——In Chicago, General Kuroki laid a wreath at the feet of the statue of Lincoln.

Prosecution of Trusts

The Washington correspondent of a Western paper who has had early information on other subjects now asserts that the Government is about to begin legal proceedings against the railroads and subsidiary mining companies which have sometimes been called the Anthracite Trust.——In the ouster suit of the State of Texas against the Waters-Pierce Oil Company, which is alleged to be under the control of the Standard Oil Company, a verdict was rendered, last week, sustaining the prosecution and calling for a fine of $1,623,900. Sentence was pronounced in accordance with this verdict. An appeal will be taken. The company's property in Texas, it is said, is not sufficient to pay the fine.——By unanimous vote, the Circuit Court of Ohio has made two decisions of considerable importance with respect to the Standard Oil Company. The first is that the Standard must carry at fair prices in its pipe lines the oil of the independent companies. The second holds that the Probate Court has jurisdiction in cases of misdemeanor. In the Probate Court at Findlay the Standard was convicted on a charge of misdemeanor in violating the State's Anti-Trust law, and the question of jurisdiction was carried up on appeal. Under this decision any county prosecutor may proceed against the Standard in the Probate Court, without procuring an indictment, for violation of the Anti-Trust law.——Dispatches from the West speak of discoveries said to have been made in Colorado and elsewhere by agents of the Bureau of Corporations engaged in an investigation concerning what is called the Lumber Trust and the acquisition of public timber and coal lands. The prosecution of several prominent and very wealthy men is predicted.——An increase, last week, of 20 per cent. in the price of cotton thread, and a considerable advance in the price of beef, are commonly ascribed to the action of combinations.

Various Notes

Dispatches from Copenhagen say that the question of the acquisition of the Danish West Indian Islands by this country was informally broached a few days ago by the American Minister, Mr. O'Brien. Officials at Washington assert that it was not broached by the authority or direction of the State Department.——The grand jury assembled at Wilmington, Del., for a further consideration of the Honduras Lottery Company cases has been dismissed, and it is announced that the thirty-six defendants already indicted will plead guilty at Mobile, where it is expected that fines amounting to $300,000 will be imposed.——Interstate Commerce Commissioner Clements, in the course of a long interview concerning violations of the railway laws, says: "One of the most wholesome things that could happen would be the putting in jail of some man of prominence in the railroad world. It would do more than anything else to bring about better conditions."——Congressman John Dalzell, of Pennsylvania, an influential member of the House and an advocate of high protection, predicts that next year's national

Republican platform will specifically promise tariff revision and suggests that the work shall be done immediately after the Presidential election. He is not in favor of revision.——Pleas of guilty were entered at New York by the St. Paul Railroad, indicted recently for granting rebates, and a fine of $10,000 on each of two counts was imposed.—— In San Francisco, Chief of Police Dinan has been accused of attempting to corrupt men summoned for jury duty in the cases against Mayor Schmitz and others, and the matter has been laid before the grand jury.

Central America

Owing to the protests of members of the Diplomatic Corps, President Cabrera, of Guatemala, has permitted the cases of the nineteen men recently sentenced to death, for conspiracy to assassinate him, to be reviewed by the court of second instance. This will take ten days. The four conspirators who committed suicide when surrounded by several hundred soldiers were Dr. Julio V. Blanco, Dr. Jorge A. Vila, Dr. Echeverria and Baltasar Rodil, a civil engineer. All were members of prominent and wealthy families, and had been educated in Europe. Their bodies, which were at first thrown into a sewer, were afterward, at the demand of the Mexican Minister, restored to their relatives and buried with honors. One report says that Cabrera has paid $2,000,000 for a country seat near Hamburg and is preparing to leave Guatemala. His troops are fortifying positions near the Mexican boundary, but representatives of the Mexican Government continue to assert that war is not expected. The treaty of peace recently signed at Amapala by Salvador and Nicaragua provides for arbitration in the future by the Presidents of the United States and Mexico, and for a peace congress at Corinto, in which the five republics will be invited to take part.

Cuba

Arbitration has restored peace at Santiago, where business was suspended and great disorder prevailed on account of the longshoremen's strike. Workers in the neighboring iron mines and other laborers joined the strikers. For some days no newspapers were published. Governor Magoon was asked by both parties to serve as an arbitrator, but at his suggestion Major Bullard, of the army, was appointed fifth member of the board. On the 29th the strikers resumed work, with a nine-hour day and the old pay, pending a decision of the board as to eight hours. At the other end of the island the manufacture of cigars has been almost wholly discontinued, owing to the strike which has been in progress for some weeks.——In the province of Havana there have recently been three cases of yellow fever. ——The statements made by Secretary Taft, in his speech at St. Louis, on the 30th, indicate that, in his opinion, at least a year and a half must elapse before the island can be turned over to a new Cuban Government. The cost of intervention has been thus far about $4,000,000, he said, and it would probably be increased to $7,000,000. It was unlikely, he added, that any large part of the sum thus expended would be repaid to the United States.

The Seamen's Strike in France

French foreign commerce is practically tied up by a strike of the French seamen in the interests of the Marine Reserves. The only ports open are Nantes and the naval port of Brest. Marseilles and Bordeaux were the first to be affected by the strike, which then extended to Havre and Cherbourg. Foreign steamers calling at French ports have not been interfered with, and thousands of the immigrants and passengers booked by French lines have been taken by American and German vessels. The strikers are willing to assist in the care of emigrants and the unloading of perishable freight, but stop every French vessel attempting to leave harbor. The Companie Générale Transatlantique has notified its officers that they will be considered as dismissed if they remain with the strikers. Minister of Marine Thomson has authorized the use of naval men on the steamers, and the torpedo boats and destroyers are being used to carry the mails to Mediterranean ports. The object of the strike is to compel the Government to increase the old-age pensions of the seamen who are on the rolls of the Naval Reserve. This includes offi-

cers, engineers, seamen, 'longshoremen and fishermen, who are all *inscrits maritimes* and liable to naval service. Three per cent. of their wages go into a fund which is augmented by Government grants, and at the age of fifty the men are entitled to a pension of $40.80 for men and $150 for captains. The Seamen's Union demands that these pensions be increased to $120 and $360 respectively. M. Thomson has recently offered to increase them to $72 and $200, but the men rejected the proposition as insufficient. The Marine Pensioners' Fund was instituted by Colbert in the time of Louis XIV, and has been maintained continuously ever since. The Government has at times borrowed from this fund, and, according to the union, to a total amount of $40,000,000, which, with accrued interest, would now amount to more than ten times that amount. Minister Thomson holds that it would be impossible to increase the pensions to the full amount demanded, because the railroad men must be also provided for, and a general old age pension law for a less amount is on the Government's program. The striking seamen are displaying extraordinary unanimity and resolution. Not only are ships unable to sail owing to desertion by the officers and crews, but the men aboard French vessels arriving immediately throw in their lot with the strikers, even tho their voyages are incomplete and they are liable to prosecution for so doing. The decision of the Government to lend bluejackets at the request of ship owners to replace strikers has proved abortive up to the present. The first vessel on which they embarked at Marseilles was unable to sail because its officers refused to navigate it.——To relieve the viticulturists of the South of France, the Government has introduced a bill to check the adulteration of wine. The use of sugar for a second brew will be forbidden and extra taxes laid upon sugar used for the first brew. The Government will check the amount of wine produced from each vineyard. The vinegrowers declare that this action is insufficient, and that the sugaring and watering of wines must be totally prohibited. An orderly and imposing demonstration of over 200,000 persons took place at Carcassonne.

Absolutism in Portugal

King Carlos has practically abandoned constitutional government and having dismissed the Cortes is promulgating laws to suit himself thru his Premier, Joâo Franco. The cause of this condition of affairs is the failure of any Ministry to commend a parliamentary majority. Franco is the leader of the new third party called Liberal Regenerator, which is the most radical wing of the old Chartist party. The chief Opposition party is the Progressivist, from which the Premier attempted to secure certain members for the formation of a coalition Cabinet, but they refused to enter the Ministry. He then offered his resignation to the King, but it was not accepted. He therefore continued in office supported only by members of his own political group, and endeavored to force the necessary legislation thru the Cortes by the use of closure. When this failed the Cortes was dissolved. The chief embarrassment of the Government is the lack of legal appropriations, since the budget of 1905-1906 is the last one passed. The constitution permits the Government to maintain the same budget for the succeeding year in case the Cortes fails to pass a new one, but on June 30th, 1907, the new fiscal year begins for which no appropriations have been authorized. The King claims the right in such a case to conduct the Government without parliamentary support for a period of three years. An official statement by the Premier says that the so-called ministerial dictatorship will confine itself to the promulgation in the form of executive decrees of such laws as are indispensable to public administration and particularly to those which had been discussed in parliament sufficiently to demonstrate their utility and advantage, and that the Government knows its duty and will assure the welfare and future of the country with or without the Cortes. One of the disturbing features of the situation was the Republican agitation, particularly in the higher institutions of learning. The Premier has met this by closing the University of Coimbra, the Polytechnic and other schools. A law imposing a strict censorship on the press has been promulgated. The newspapers united to overthrow the law, and

a test case was made by the editor of *O Mundo*, who published an article declaring that the Premier was insane. The editor was convicted and fined $110 and costs, but on the case being carried to a second court he was pronounced not guilty. The defense endeavored to prove the truthfulness of the allegations by the testimony of a number of alienists, and many prominent men, including a former Premier, argued in court against the validity of the law. The leaders of the Progressives and other Opposition parties, including seven of the twelve members of the Council of State, have addressed a letter to the King protesting against his unconstitutional assumption of authority. The hopes of the Legitimatist party have revived, and a deputation has been sent to confer with the Pretender, Duke Miguel of Braganza. King Carlos is endeavoring to strengthen his power by by raising the salaries of civil servants and granting liberal subsidies. He promises an old-age pension to the working men, relief from taxation, and assistance to the viticulturists. He is also trying to secure the support of the disaffected soldiers and sailors by daily visits to the barracks.

The Russian Duma

The Constitutional Democratic party has again demonstrated its power in the Duma by dismissing from consideration the question of terrorism, in spite of the combined opposition of the Left and the Right. The conservatives of the Right introduced the resolution condemning terrorism for the purpose of embarrassing the Duma. If the Duma should condemn violence it would lose the confidence of the people and offend a large portion of the members, while if it were approved the Government would have ground for putting an end to the session. The Revolutionists, on their side, were anxious to have an opportunity of expressing themselves in violent attacks upon the Government. The motion to table the resolution was made by M. Nebovidoff, of the Group of Toil, who declared that any action on the part of the House would be useless, as the censure would be addressed chiefly to the dead. If the Government with a million bayonets was unable to stop terrorism, of what avail would be a resolution of the Duma? The motion to table the question was carried by a vote of 219 to 146. The Russian Socialist Congress held in London was dominated by the Majorities or radical wing. They declared their independence of the Constitutional Democrats, whom they accused of supporting the Government for the purpose of establishing a political system based upon property qualifications and for the oppression of the proletariat. This action was taken by a vote of 159 to 106. The debate on the agrarian question in the Duma has been concluded, and the subject placed in the hands of the committee. The subject has occupied the attention of the Duma one or two days every week, and has been of no value except as affording the peasant members an opportunity to denounce the Government for withholding the land.——The Minister of Justice, in discussing the alleged atrocities of the Cossacks and police in the Riga prisons, admitted that the pris-

oners had been beaten with whips and rubber scourges, and struck with the fist, but denied the further allegations of torture made by the committee of the Duma. Charges had been brought against forty-two police officers for such cruelty, altho, in the opinion of the Minister, their action was no more than could be expected in consideration of the brutality of the terrorists, who had killed or wounded a thousand of their comrades in the Baltic provinces alone. The Duma expressed dissatisfaction with the reply of the Minister.

The French in Morocco

The Sultan of Morocco has formally promised to accede to all the demands of the French Government, which include the following items: The dismissal and imprisonment of the Governor of Marakesh for conniving at the murder of Dr. Mauchamp by a mob in that city; the punishment of all those concerned in the murder and similar attacks on French citizens; the payment of an indemnity acceptable to France; the immediate organization of the international police in accordance with the terms of the Algeciras Convention; the policing of the Algerian frontier; and other claims and requirements. The French military force which seized the town of Udja on the Algerian frontier in reparation for the murder of Dr. Mauchamp have made themselves very much at home and are apparently in favor with the people because of their ready expenditure of money in the markets. The native constabulary of Udja have taken the oath of allegiance to France "as long as the French occupation lasts," and have been placed in charge of French officers. The tri-color has been placed over the Grand Mosque with great ceremony, being saluted by the 3,000 men under General Lyautery and all the guns in the battery. As no blank cartridges were at hand the shots from these were directed toward targets 1,200 yards distant, and the marksmanship of the French is said to have made a decided impression upon the natives. Marakesh, the second capital of Morocco, declared the deposition of the Sultan Mulai Abdul Aziz and the accession of his elder brother, Mulai Hafid, resident in Morocco. It is not yet known whether he will accept the offer and head the revolt against his brother or not. He is an intelligent man, thirty years old, and learned in Moslem theology and history. All of the foreign residents have left Marakesh.——The Sultan's forces, which have been engaged for years in a desultory warfare against the Pretender, were defeated in an engagement near Medilla with severe loss. Among the killed is the Sultan's uncle Mulai Bu Bekir. The Pretender now has 20,000 well-armed men, and, since he has been joined by Raisuli, his cause has been advancing.

The Rebellion in China

The outbreak in China has not been suppressed, and according to all accounts the disaffection is spreading. It differs from the Boxer disorders in being directed against officials instead of foreigners. The mission stations have not usually been injured, but the yamens have been attacked and the officials put to death or compelled to commit suicide in each town where the disorders have occurred. It is believed that the Triad Society, which has for its object the overthrow of the Manchu dynasty and the restoration of the old Ming dynasty, is back of the movement, but that the present rising is premature and due to the failure of the officers to distribute famine relief funds. The center of the disturbance is the town of Juan, fifty miles southwest of Amoy, but spontaneous and apparently concerted outbreaks occurred in many towns in the southern part of the province of Fo-Kien and the northeastern part of the province of Kwang-Tung. The important city of Chang-Chow is threatened, but so far only smaller places have been captured by the insurgents. Troops were dispatched from Canton and Fu-Chow and met the insurgents between Swatow and Amoy. The rebels were dispersed with a loss of some 600 men, but the trouble is not thought to be over, for the rebels number over 30,000, and have been supplied with arms from the Triads in the United States. The American gunboat "Helena" is at Amoy.

Shooting in Season

BY GROVER CLEVELAND

Ex-President of the United States.

OF course I do not mean to merely commend those who obey the game laws or condemn those who disobey them. No decent sportsman will violate them or give the least countenance to such violation on the part of others. This latter—the withholding of countenance—is or should be sometimes a more difficult and unpleasant thing to do than at first sight may appear. In a superficial view it means a silent disapproval which need not disturb in the slightest degree the friendship and the warm feeling of good fellowship between the game-law breaker and the sportsman who sees duty in a silent withholding of approval. This is to say that the violator may enjoy his prohibited and disreputable sport, the law-abiding and reputable sportsman may discharge his entire duty by simple non-approval, there will be no disturbance of friendly relations or jolly companionship, both the violator and non-approver will be contented and satisfied; and there let the matter rest and the incident be closed.

EX-PRESIDENT GROVER CLEVELAND, AGE SEVENTY.
His latest picture, taken March 26th, 1907.

In writing of "Shooting in Season," I have much more in mind than the mere restraints of game laws or such shallow, vapid and absurd accompaniments of their violation as I have mentioned.

My conception of the subject embraces a "season" not necessarily limited by legal requirements, but covering in addition all times of the year and at all hours of the day or night, during which the kill-

ing of game by the law of nature, leads to its ruthless slaughter and steady, sure extermination. So the "game-hog" who shoots, lawfully if you please, but who kills for the sake of killing and so that he can boast of a record bag, heedless of the utilization of his game and caring nothing for its waste, in my view, is guilty, not only of shooting unseasonably, but disgracefully.

EX-PRESIDENT CLEVELAND SHOOTING DUCKS

On the game preserve of General Edward Porter Alexander, at South Island, South Carolina.

Statutory provisions may not meet every necessity of game protection. When they are deficient they should be supplemented by the unwritten laws of true sportsmanship; and no violator of these unwritten laws should be allowed without challenge to exploit himself as belonging to the fraternity of honorable sportsmen.

There may be no statutory limitation of the period within which migratory birds and fowl which breed in the far North may be killed, prior to their flight to their nesting places from their winter sojourn in the South, nor any law protecting them during their passage. And yet, in the interests of game bird and fowl preservation, there should be a sporting sentiment decreeing that these migrants should be exempt from attack just prior to their flight, and that during their speedy journey they may seek rest and food for a moment without coming within range of a murderous ambuscade.

In my opinion the unwritten law of sportsmanship should be deemed as obligatory upon all members of the shooting brotherhood as any law on the statute books; and there should be as determined an effort to enforce obedience to one as to the other.

A GOOD DAY ON THE DUCK PONDS.

Ex-President Cleveland and Admiral Benjamin Peffer Lamberton showing the trophies of the hunt to General and Mrs. Alexander. From left to right, General Alexander, Mrs. Alexander, Ex-President Cleveland and Admiral Lamberton. From photograph taken in March, at Ford's Point, near Georgetown, South Carolina, the home of General E. P. Alexander.

AFTER A DAY OF DUCK SHOOTING.

Edgar A. Bancroft, of Chicago, at extreme left; Mr. Cleveland and Admiral Lamberton, at General Alexander's home in South Carolina.

I have mentioned a sort of negative discountenance of violations of laws fixing the seasons for shooting as a duty devolving on sportsmen; but when I said that such withholding of countenance might be less easy than it appeared, I had in mind the supposition that such a situation could not fail, in the sense of sportsmanship, to considerably jolt the personal relations of the parties implicated. I confess I do not see how the preservation of sporting constancy. I am unalterably opposed to the notion that the sins of the camp should not be remembered in the social swirl of city life. A just and conscientious sportsman cannot even there forget that his friend, the life of every gathering and the fountain of table wit, when last in camp, sneaked out at night and shot ducks, and that on a recent fishing excursion he hired a miserable creature to set night lines.

Copyright, 1907, by Underwood & Underwood, N. Y.

GENERAL EDWARD PORTER ALEXANDER'S DUCK PRESERVES OF ENGLISH MALLARDS, Where Ex-President Cleveland went duck shooting in March.

this can be avoided. A genuine sportsman may refrain from noisy quarrel with a friend flagrantly guilty of a violation of game laws—written or unwritten; but how he can absolutely condone and forget the crime and retain for the criminal the same affection and confidence and reliance as before is beyond my comprehension. In any event, I am entirely satisfied that such amiability as this is not what is needed for the enforcement of game laws and

If game is to be preserved for those who now enjoy all that is rational and healthful and recreative in outdoor shooting, and if those who come after us are to know the pleasures and benefits of manly, considerate sportsmanship, it devolves upon the sportsman of today to enforce, in every possible way, the written and unwritten laws which recognize the importance and the sober duty of game protection.

PRINCETON, N. J.

Vacation Experiences

BY READERS OF THE INDEPENDENT

[Our readers have never responded so generously and numerously to our requests for contributions as they have in this case. Evidently they enjoy vacations even more than harrying a heretic or nagging a new woman, which is, on the whole, a good sign. They say you can get better acquainted with a person on a three days' outing than a year of conventional intercourse. Certainly we feel better acquainted with our readers since we have shared several hundred of their vacations. We do not claim that the contributions we have selected to print are the best of the lot or even that they are any better than if we had shuffled the envelopes and taken every tenth one, but they are fair average samples, and by their variety at least will show how many different ways there are of having a good time, if one can only get the time. To all who contributed to make this Vacation Number a success, and especially to those who got crowded off the excursion train, we give our hearty thanks. May they all get the kind of a vacation they like best, and not have some one else's vacation thrust upon them.—EDITOR.]

After Thirty Years.

DEAR EDITOR—Your request for an account of vacations recalls our delightful last summer's trip, so I'll tell the readers of THE INDEPENDENT about it

That they may understand why it was the brightest chapter in my married life and that of my good husband, I must give them a glance at the preceding chapters.

Thirty years ago last June I, a happy girl of eighteen, was united, on the twentieth anniversary of my parents' marriage, to Peter ———, who, from being the playmate of my childhood, had become the "chosen one" of my youth. As we left the old home in Connecticut for a new one in the Far West we promised my parents in five years to return and celebrate their silver and our wooden wedding together. Our youthful dreams pictured the new home as one of abundance, the result of fine crops and growing herds that our hard but willing labor was sure to produce. Very different has been the reality; the pioneer's life has many drawbacks, and while much real happiness was enjoyed in our humble home, where love was the ruling power, the financial question, "How to make both ends meet?" has often been a perplexing one.

In those first lonely years, when an intense longing for home and its loved ones often filled my mind, thoughts of the anniversaries to be spent together were my chief comfort, so you can imagine my heartache when lack of funds and urgent work at home forced us to postpone the promised visit. Yet, with the buoyancy of youth I felt sure that in five years more we could certainly go home; but, no; dry years and kindred troubles, as well as an increasing family, made such a long trip still out of the question. So, from time to time, our visit was deferred, but in my heart I did not give it up until in our twenty-fourth year a terrible accident came that crippled Peter for life. This was a heavy blow, but our children showed their willingness and ability to help lift the family burden and faithfully have they done so.

Fancy our surprise when, last May, our two daughters, who are teachers, and our boys, who manage the farm, presented Peter and me with tickets for the long-desired trip to Connecticut, and money enough for all other expenses. It seemed too good to be true! We were really to celebrate the fiftieth and thirtieth wedding anniversaries together! Need I tell you of our eager preparations, our journey over a marvelously-changed country, our hearty welcome, the meeting of sisters, brothers and friends, to whom we had become but a memory, the exchanging of experiences, the quiet joy of being with father and mother again?

Then came the golden wedding day, with its happy gathering, its gifts, its feasting and fun, and its many tender memories. But I am reaching the limit assigned, so must leave to your imagination the pleasant visits and sight-seeing that helped make our three-months' vacation a truly ideal one.

AN UNDISTINGUISHED READER.

A Two-Minute Vacation.

On the wall of my study hangs a painting by a New England artist, illustrating Bryant's poem, "The Groves Were God's First Temples." The artist drew his inspiration from the same noble forests in which the poet saw the spacious cathedral, whose pillars are majestic tree trunks and whose vaulted roof the mingled branches. A wonderful temple it is, with far-reaching aisles between the stately pillars of oak, with gleams of sunlight thru unseen windows, with solemn mystery where the distant shade lies deep.

Here I take many a momentary stroll. Here

I often rest a moment from my labor. Here I find inexhaustible store of quiet, of peace, of refreshment of soul. The day's work presses and thronging duties hold me in their grasp. I cannot lay them down and flee away to some seashore holiday making, or to some secluded resting place in forest or mountain. But I can lean back a little while in my chair, let go my work a moment, slip away with my soul down these forest paths, rest a moment beneath this quiet shade, drink in the calm and the patience of the silent trees, feel the presence of the Almighty, send up a prayer of mingled praise and petition—then come back with mind refreshed, hope renewed, and faith strengthened to my waiting work.

(Rev.) J. Percival Hugget.

Cedar Rapids, Ia.

Recreations of Successful Men.

The English edition of "Who's Who," which contains the biographies of the famous living men of England, and of many other lands, has one unique feature. In the blank which is sent to each person mentioned, the favorite recreation is asked for, and the vote included in the biography. To read over the selections of these famous men, is full of interest. The wide field over which the votes are cast is startling. In addition to some fifty recognized sports, at least one hundred other occupations receive one or more votes for a favorite amusement. The selections range from such pastimes as pianola playing, juggling and tattooing to taxidermy and donkey shows. One well-known clergyman voted for "collecting strange oaths on the golf links, wherewith to address scorching cyclists in a suitable manner." Another gave his favorite recreation as "smoking a sweet briar pipe after lunch, a mild cigar after dinner and ruminating on the before and after."

A few of the individual answers are interesting to note. Professor Schiller, of Cambridge, gives his favorite avocation as editing *Mind*, a task which would be anything but a recreation to most men. Hon. James Bryce votes for mountain climbing and fishing, Rudyard Kipling for cycling and fishing, Alfred Austin, who might easily be supposed to find his greatest recreation in poetic composition, for riding and gardening, Justin McCarthy for travel and sailing, and Lord Roberts for shooting and cycling. Among the Americans accorded a place of honor, President Roosevelt votes for ranching, President Hadley for tennis and golf, and Dr. William Hayes Ward, editor of The Independent, for Assyriology. H. G. Wells votes for "a detailed description of his various illnesses." It is startling to see that Professor de Martens, the Russian representative in The Hague Court, gives "fighting" as his favorite amusement.

A detailed tabulation of the selections follows:

Tabulation of Votes for Favorite Recreations, Compiled from the edition of "Who's Who," for 1907.

Shooting	1,179	Field Sports	65
Cycling	772	Drama	61
Golf	749	Book Collecting	57
Fishing	701	Farming	56
Travel	432	Fencing	55
Rowing	363	Football	55
Cricket	348	Skating	53
Riding	322	Whist	53
Tennis	313	Mechanical Work	52
Music	310	Racquets	40
Gardening	299	Writing	38
Sailing	287	Raising Animals	33
Walking	265	Curling	28
Chess	229	Croquet	25
Reading	220	Volunteering	25
Art	217	Bowling	24
Mountain Climbing	157	Canoeing	21
Natural History	152	Fives	18
Scientific Research	144	Hockey	18
Photography	141	Boxing	16
Motoring	133	Archery	13
Curio Collecting	100	Exploring	13
Polo	79	Gymnastics	12
Driving	75	Genealogy	11
Billiards	75	Stamps	10
Swimming	74		

It must be remembered that the majority of the answers are by elderly men, for, despite Dr. Osler, few under forty have won a place of distinction in "Who's Who." Many of the figures are full of significance. The inherited love of shooting in the English race gives that sport an easy first. Cycling, which seems to have passed its meridian in this country, still has a strong hold in England, while motoring has an insignificant place with twenty more popular sports before it. Music stands in the tenth place. If the Germans were asked to vote, this recreation would doubtless receive first honors, and the French nation would probably pull fencing from thirty-first place well toward the top.

A total of 8,858 votes were cast. Dividing these roughly into three classes, 6,439 votes were for athletic sports, outdoor pastimes and games; 1,331 for literary, artistic and agricultural occupations, and 1,088 for research work and more serious pursuits.

Among recreations that received a scattering vote might be mentioned pig-sticking, bee-keeping, solving acrostics, skiing, consulting time tables, magic, ballooning, and sleeping. The members of the gentler sex, accorded a place, banded together and gave four votes to sewing. A few selections are hard to catalog, such as "divers—golf excepted" and "fond of all sports, but a duffer at them all." One lady, evidently overwhelmed by the honor of receiving a blank, has the following given as her favorite recreation:

"Horses and dogs are her best friends. She is a fine rider and advocates the cross-saddle for women, herself being at home on a barebacked horse as much as in the saddle. She is a good shot and swimmer, but has foresworn the gun, and published much decrying shooting as an amusement, notably 'The Horrors of Sport.'"

Occasionally we meet a very blasé person, who complains that all recreations have been

tried and tired of. Such a person should find a wealth of suggestions in glancing over this article. GARDNER RICHARDSON.

WOODSTOCK, CONN.

How to Mount the Vacation Pictures.

To one who belongs to the second or third generation of camera fiends there comes at times a desire for something new in the method of preserving and exhibiting the prints that accumulate during the summer's vacation time. Of course, to us who have made the snaps they are enjoyable even in their conventional shape, mounted in the usual album, but robbed of the personal, deprived of the mental picture back of the one in black and

A PAGE OF THE VACATION BOOK.

white, don't these collections come, at times, dangerously near falling into the same class with the family photograph album on the parlor table?

One should have a bunch of, say fifty, good, clear prints, twenty or thirty sheets of heavy white paper, about 9½ by 11 inches, and the ability to write a good legible hand, or, lacking that, a typewriter, with a fairly fresh, black ribbon. I was about to add the knack of telling a good story is necessary, but, of course, we can all do that when we have a summer's outing for the theme.

Spin along your yarn and tie in prints here and there, where they are appropriate, after the manner of the modern *de luxe*, and limited, editions of "Visits to the Scenes of Famous Dog Fights," or other productions of the hand power printeries. If the work be done with pen and ink this is very easy, and even in using a typewriter there is little difficulty, as space can be left for the pictures about where they should come on the sheets, and then the prints can be attached afterward.

I have not the least bit of doubt but that when the rest of your summer crowd see your story, they will flatter you by hinting that something of the kind would be very acceptable to them along about Christmas time. If you are susceptible to this sort of flattery, I would advise you to make a negative of each sheet just before binding, and then when Brown laughs uproariously at your version of how his trout fly happened to light in Miss Burwil's hair, and wishes that she could see the book, you can hand him a photo-miniature of your very limited autograph edition, and send another to Miss Burwil, with the season's compliments.

The sheets, 10 by 12 inches, or smaller, are readily copied with an ordinary view camera on to 4 by 5-inch plates. I have had the best success with the regular contrast or copying plates, but any good plate may be used. Prints made from these plates on blue-print paper and bound in ordinary, ingrain wall paper are very effective.

HERBERT S. BAILEY.

AGRICULTURAL COLLEGE, MICH.

The Roof Beautiful.

How we made a roof beautiful and how great was our delight therein would take more than 500 words to tell. But how little it cost compared to the ordinary vacation and what interest it paid as an investment I must tell: hoping others will go and do likewise.

Happily, our home, though a "brick box with a tin lid," is in ozone-swept New York City. But how, hemmed in on all sides by rows of houses, to benefit by those breezes? This is how we did it: By living on our roof.

Put the cost of a slat flooring, $15; railing, $5; an awning, $25; a couple of steamer chairs and a hammock, $10—all this once and for all—against the $15 to $20 apiece, week after week, for board at some stuffy hotel and you guess how far ahead of the game we were.

One evening, while our neighbors sweltered on their dusty front stoops as we sat breathing deep of ocean breeze on our house top, Socrates burst out with "Why, the difference between this and an ordinary outing would pay for a garden. By jove, let's have one!" And we did.

Twenty dollars bought us earth-filled boxes enough to border our pleasaunce; moon flowers, morning glories and nasturtiums were inexpensive, easy to tend, and free flowering. We even indulged in a couple of bay trees and dreamed of a rose wreathed pergola. In short, we luxuriated in our hanging garden and our wonderful sky-scapes (nobody suspected what magnificent views

were ours) from June 1st till November 31st. The year before we had worried through six weeks at a usual resort, at a cost—not counting railroad fares and Fees (capital F there, please, Mr. Editor)—of $180. This time we had nearer six months' real instead of feigned pleasure, at an outside outlay of $100. Best of all, everything is there, ready for next season.

Am I wrong to say our roof resort has proved an investment yielding more than monetary in terest on its par value?

E. M.

Brooklyn, N. Y.

Four Months in Europe for $200.

We were planning a vacation. Where to go was the all-absorbing question. We had $200 each to spend on a good time and we had a four months' vacation to enjoy. I suggested that we both go to Europe, visiting England and France.

Finally, after much deliberation, we engaged passage on an eight-day steamer, via Boston and Liverpool, as we found out that we could make better arrangements by going to Boston. We bought our tickets direct for Paris. We took only luggage that would not necessitate extra expressage, and wearing apparel that would be suitable for the time and season, with warm wraps to wear on the steamer and during chilly days on land.

The expenses for our trip began from the day we embarked on the steamer at Boston. We went, as stated above, direct to Paris. Upon arriving there we engaged a room at a hotel for 50 cents a day, where we remained four days, during which time we spent in getting acquainted with the vicinity. In the morning we would order but a light breakfast, *petit d'jeuner,* for two, which consisted of coffee, milk and rolls. Our other meals we took in the little restaurants, known as *bouillons,* which abound in Paris, and where one can order a good meal, with wine, for 25 cents. In the interval, we had found a furnished room for $9 per month, centrally located and accessible to all lines of traffic. We made arrangements with the concierge to let us have cups and saucers, and we made our own breakfast on an alcohol lamp. We now felt settled and at home; we looked over our purse, and putting aside our return passage money, $80, we set a limit to our personal expenses; our rent we paid six weeks in advance, as we intended to remain that length of time; our laundry was done by the concierge, who happened to be a laundress by trade. Our rent and laundry bills being settled, our return passage rate safely put away, and arrangements made for two meals per day at a restaurant, on an average of $1 (5 francs) per day for the two of us, we found that we could have an allowance of an additional five francs per day for amusement, sight-seeing, etc. One can have, and we did have, an enjoyable time on that amount. We visited all the places of note, attended a theatrical performance and went once to the Hippodrome. Although cabs are very cheap (30 cents the drive) we did not take them as a rule. We relied mainly on the busses as conveyances. On leaving New York we had bought a Baedeker, and we followed it pretty closely. During the six weeks we remained in Paris the total sum spent was:

Room at hotel, 4 days	$2.00
Four petits d'jeuners, for two, at hotel.	1.60
Tip to hotel employee	.40
Rent for furnished room, 6 weeks	13.50
Tip to maid	.20
Table board, 6 weeks	45.00
Tip to restaurant waitress for 6 weeks.	1.00
Amusements, sight-seeing, etc., 6 weeks	45.00
Tips and incidentals	5.00
Total	$113.70

After a six weeks' stay in Paris we had $147 left. On this sum we intended to go in the South of France, visit the old city of Toulouse, take in Pau, the birthplace of Henry IV; Lourdes, noted at the time for its pilgrimages, and the summer resort, Luchon, situated in the heart of the Pyrenees, well known for its health and healing springs, also its picturesqueness. Besides we had planned to stop two weeks in London on our way back to the United States.

Our itinerary being agreed upon, we purchased third-class for Toulouse. We made it a point to travel by day in order to enjoy the scenery, also always to take an express train. The rates are the same. We arrived in Toulouse at night, and went directly to a hotel, where we engaged a room for the month. Our meals were paid for each time and taken either at the hotel or at the *bouillons,* similar to those in Paris; the living expenses did not exceed $1.25 per day. We bought a guide book of the city and spent two weeks sightseeing; took a few tramway excursions in the suburbs.

The third week we spent visiting Pau, Lourdes and Luchon. In Luchon we engaged a cab for an afternoon drive, the rate of which was 20 francs ($4), with a 1 franc tip (20 cents) to the coachman. The fourth week we kept to recuperate a little from the fatigue we were experiencing, visit the stores and give another look at the ancient city of Toulouse. On our return to Paris we summed up our

expenses and found that our Southern trip had cost $92, itemized thus:

Railroad fare to Toulouse	$14.00
Room rent at hotel	9.00
Tableboard for the 4 weeks	35.00
Trip to the Pyrenees	15.00
Tips and incidentals	5.00
Return fare to Paris	14.00
Total	$92.00

We were now on our way home with $56. The same day we arrived in Paris we purchased a third-class ticket for London, and the next day found us safely installed in York road, about five minutes' walk from Westminster Bridge. We remained in London two weeks; again we relied on Baedeker, visited all the noted places, took an excursion to the Crystal Palace, occasionally took a cab, rode in busses and walked the rest of the time. Our expenses for the two weeks, with fare from Paris, were $47.50:

Fare from Paris to London	$10.00
Room for two weeks	5.00
Tableboard	17.50
Amusements, sight-seeing and tips	15.00
Total	$47.50

We were now longing for the Stars and Stripes. Our baggage was quickly made ready, and before we left our room we balanced our books, with these results:

Fare to Paris, from Boston	$60.00
Sojourn in Paris, 6 weeks	112.70
Trip to Southern France	92.00
Fare to London	10.00
Stay in London, 2 weeks	37.50
Return passage to New York	80.00
Total	$392.20

We had $7.50 over in the treasury; had had a good time, a long vacation and a never-to-be forgotten experience.

New York.

Hammock-Reading.

Hammock-reading is a luxury that requires preparation. It presupposes a kind of mental negligée, which seeks to be freed of heaviness or depth. It is a species of intellectual sensuousness, akin to the Roman habit of reclining at meals; but there is this distinction: that special care is taken in the one case to avoid over-rich or over-solid pabulum. Hammock-reading is usually frothy.

The aura of such luxury is like the color of a French novel. Possessed of that fresh tenderness of the heart of young lettuce, like lettuce the paper-backed novel requires to be deftly spiced; a tang, a good suggestion of acidity, which will bring tears to the eyes, and will encourage an inclination for more. A bright, airy cover must enclose a bit of organdie or mull or lace, agreeably interwoven with the necessary ingredient of blue serge or white flannel. The mind must be slightly jogged and the heart airily tickled. You like a golf story, a motor-car experience—anything active—to accentuate the utter abandon of your swinging hammock.

Let us call it humming-bird literature, if you please—a mere dipping into life's secret, a skimming along the surface of passion, a superficial suggestion of experience—slight as the pink suffused thru the twilight blue. Our mind is in a dainty humor—an unconscious excellence we all possess when the world is fair and green and open, and when we are at ease.

It is confection we wish for summer reading—anything that will ice our minds with momentary pleasure. Hammock-reading is a sort of mental rubbing down after physical exhaustion from tennis or golfing or rowing or walking. It is the siesta hour of activity, the calm that follows without violence the present-day popularity of the strenuous life.

We have all had such times, swinging between heaven and earth; our eye has a certain instinct for associating the yellow-backed novel with the green field. The forefinger was made specially as a book mark for such volumes. We are free to turn down the corners of the leaves. A turned-down corner is the painter that moors the story to our remembrance. For facts drift in the country. The hammock invites you to flirt with yourself—if there are none better to flirt with. You begin to realize, with the gentle swaying, just how much you value your seriousness, and by the extent to which you court light literature, you begin to understand just how far you value yourself.

Hammock-reading requires preparation. The place on the lawn is yours for the afternoon; the house is quiet, for others are either on the lake or floating somewhere in Time, between three and five of the clock, when country life, because of its peacefulness, requires pause. You search in the sitting room for something to read; for fear of disturbing the house, you creep to the table as an intruder would to the sideboard. There is brought painfully to your ear the drowsy buzz of a fly, the unfailing tick of a clock. The flowers in the vase look pathetic in their freshness; the bird in the cage is dozing on one leg. You pile your arms with irrelevant printed matter, for you conjure up many moods. You fear that intellectually primed for a row, you might, in midstream, suddenly wish to paddle. To get out of a hammock for something breaks the illusion.

Having deposited your freight—books, magazines, papers, a writing pad—all on the bench under the shade trees, you return to the veranda for pillows, which, once spread in the hammock, seem to take your shape, to invite you to come. Again you trudge the garden path to the house, returning this time with a fan under your arm, and holding a glass of something cool—as your taste goes—but accompanied by the unmistakable elfin tinkle of ice. *C'est la!* Everything for comfort within reach.

Your collar is turned in at the throat, your sleeves rolled above the elbow—this will suit both man or girl, but esthetically, the latter is daintier. The shirtwaist man has always seemed a bull in the china shop of femininity. Then you sink into the hammock. A sigh, a wriggle, a punch of a pillow into this curve, a turning here and there, and ease hangs loose about you. It is worth while reading!

Where you lie, you have but to stretch your arm, and there is a frosty feeling of hoar on the glass. And you know by the touch whether you have hold of a ten or twenty-five cent magazine. And assuredly a blind man could *feel* a French novel.

You sway gently, to and fro; to and fro; you turn the pages idly, sounding your momentary capacity, throwing aside the contents with that perfect confidence an editor would not dare exhibit. There is just enough of yourself hanging over the edge of the hammock to tell, at a distance, whether you be bird or beast. .Flounces fleck the taut ropes as languidly as seafoam does the shore.

Every now and then you shift to avoid the sun peeping between dense green, you turn the pages, and if the eye pauses, you pause. You seek impressions, sensations, not knowledge. Your psychologies must be dressed in flimsy feelings; your Hedda Gablers be flirtatious, not intense. The author must breathe emotions across your being, must whisper gossips into your external ear. Your consciousness is to be lulled; opinions are to be thrown as chaff before the summer winds.

Thus you are settling for a long reading. Far off you hear the lowing of cattle, the resonant call of men in the fields; a wagon creaks along the distant road; the silence is actually loud.

None can resist it—this thing we call hammock-reading. Your soul begins to keep time with the rhythm, to and fro; your heart has a placid outlook upon all things that are fair and liquid; your mind is at rest. Your personality is a composite blur, not of doubt, not of "oneness" with nature, but of blissful and unalloyed sleep.

Something falls to the ground; it is the book you were to have read. Other things lie scattered about; they also are the books you were to have read. The ice grows less and less, as the sun twinkles and glistens on the dissolving crystals. There are but two facts in all this hammock-reading—your listless hammock and your sleeping self.

MONTROSE J. MOSES.

NEW YORK CITY.

The Best Vacation for a Minister

is not a "vacation" at all. Vacation means *emptying*, and that is what the minister's regular work is. The true way of spending the days that a man has away from his pulpit and pastoral work is not in vacation, but in filling up for future emptying.

The purpose of the ministry is "applying ideals to the life of men." The Sermon on the Mount gives him the ideals; the best use of a minister's free time is in getting a knowledge of the life of men.

Here is the story of two summers, which I found more profitable than any spent in the woods, even though I was one of three men to catch 227 trout in four hours, the last time I was in the Adirondacks, even though I got a bear the last time I was in the Canadian woods.

The first of these two most profitable summers was divided between driving a moving van and driving an ice wagon for the American Ice Trust, in New York City. I learned more about the saloon problem, and the immigrant problem, and the tenement problem in this experience than I have ever been able to learn from books. Moreover, I found that carrying one end of a piano up three flights of stairs and swinging 200-pound cakes of ice into a saloon refrigerator is an excellent method of developing the muscles of the back.

The other summer was even more profitable than the first. It was spent in traveling about the country, thru the factories and mills and mines, talking to the workmen and workwomen and workchildren, the employers, the heads of unions, the political leaders and the representative citizens of the towns I visited. I had a set of questions which I asked each of these. One of these was, "How about the Church? Another was, "What about labor unions, walking delegates, child and woman labor, and Government interference?" This I asked of employers. Of the working people I asked about their attitude toward their employers, their conditions of work, etc. And in the South, of course, I asked about the negro question.

I have not room to give more than a summary of the things I learned. In the first place, the work-people, I found, failed to interpret the sound of the church bells as the "Gospel of Labor," telling them that "The Lord of Love came down from above to be with the men who work." In almost every case they regarded the church as a Rich Men's Comfort Club, and ministers as bought cowards or blind fools or both. Jesus was to most of them (to use the words of Lucas, in "The Jungle"), "The elegant prince of our debauched and vicious art, the jeweled idol of our society churches, the high priest of property and smug respectability," a mysterious being whose name makes a convenient word for religious people to conjure with, and for common people to use in swearing or praying. I found very few of these people who recognized in Jesus what he really was, the Man of the People, the Heretic and Revolutionist, the great leader in the struggle for human freedom and brotherhood.

The most important thing that I learned in regard to the Church and what the minister should do from the standpoint of the employers was that those employers who believe in child-labor and the repression of the unions, those employers, in short, who spoke of the business they were engaged in as "my busi-

ness," thought that ministers should confine themselves to doctrine and never bring present-day problems of labor and politics into the pulpit.

As to unionism, one large employer told me that he welcomed organization among the men in his shops because it made them reliable and self-respecting, but most of the employers regarded unionism as a curse. This attitude of the employers was reflected in that of the employees. The only man for whom the workmen expressed any real love was the man who welcomed organization.

On the question of child labor, I found some employers who regarded it as a blessing to the children to keep them off the streets and out of mischief, but most of them considered it an evil, justifying it, however, on the ground that they were forced to employ children to compete with other factories where children were employed.

In regard to the negro question, I found more discrimination and breadth of view than I had expected, discrimination between good and bad negroes I mean, not between the races, although one representative of Georgia told me that he looked forward to a race war which would result in the re-enslavement of the negroes; and one minister in Spartanburg, S. C., threatened me with personal violence because I answered his statement that "Roosevelt ought to be impeached for eating with a niggger," by quoting Luke xv:2: "And both the Pharisees and the scribes murmured, saying: 'This man receiveth sinners and eateth with them.'"

The greatest impression of the whole summer was of the growth of the spirit of Socialism. Some men with whom I talked looked forward to it with fear: for instance, one employer in Rochester, N. Y., told me that: "The business world today is on top of a volcano and Socialism is the fire that will blow the cover off and will raise hell." But among the workmen the most thoughtful seemed to be turning toward Socialism, with a hope like that with which the early Christian community regarded the second coming of Christ.

EDWARD J. WARD.

HAMILTON COLLEGE, CLINTON, N. Y.

Vacation in Winter.

There are thousands of farmers who can find no better place in summer than their own homes. There they have the hay fields, the growing corn, the berries and early apples, the fresh milk and cream for strawberries, the birds to sing and the bees to make their honey. The hills and the valleys are theirs; the brooks that grow quiet in June, and the heavens that watch over them at night. They do not need to go anywhere, only to find out what wonderful and beautiful things they possess. Any one may spend a lifetime making farm life each year more charming and more satisfying.

But in winter it is different. The farm work closes about November 1st; with snowdrifts piling soon after—blizzards raging at intervals, and each year finding the wear upon health more pronounced. Why not vacate? Those who have large dairies that need winter care can generally secure faithful overseers. But a much larger number can leave their homes entirely closed. Keeping myself one cow and one horse, I let these out for their use, and start for Florida each November. The ticket by boat is less than $40 to Jacksonville. There is an additional railroad fare at each end of the boat route—including a steamboat fare up the wonderful River St. Johns. This brings me into central Florida and Orange County. Here I have bought ten acres for a house lot; built a lovely home, and added an adjacent park of 40 acres of pines. If one prefers to board, he can find pleasant accommodations for three months, at a cost of about $50 to $60, or he can hire a furnished house at about $10 or $12 per month.

This saves on my coal bill about $100, on my groceries' bill about $50, on clothes at least one-half, on hired help about $50 more, while it obliterates doctors' bills. During the winter months I grow my own vegetables, and soon will have my own fruits—with, of course, a growing surplus. I get my own birds and roses all winter, while the pine woods are full of free ozone. The thermometer rarely goes below 45, and touches the frost line not more than once during the winter. Fireplaces are the order of the day, and there is wood enough for the picking up. A lump of coal is never seen, and stoves only in the kitchens.

I rejoice in the ownership of an orange grove, which all winter is covered with golden globes—as free to me as apples in a New York orchard; nearby are growing the pines, which stand around us, from 80 to 100 feet in hight; the picturesque lake spreads away from the doorway half a mile; and amidst all stands the cottage itself, where the author shows his faith in winter vacations.

At my Northern home I am able not only to feed myself but to sell a handsome surplus; at the Southern end of the homestead—the vacation end—I propose to accomplish even more in the way of self-support. On the whole I am not sure which should be called the vacation end—that spent with the apples at Clinton, or that spent with the oranges at Sorrento.

E. P. POWELL.

CLINTON, N. Y.

Catching Snakes with the Fly.

I was fishing for bass in the Shenandoah, and approaching a favorite chuck under the willow trees, when I saw a large water snake leave the bank and make for the other side of the river. Usually, when I saw such a fellow, I laid the line across his back, harmlessly enough, for he instantly let go every thing and sank out of reach; but this one was too far away to be meddled with, and I gave him no further attention. Arrived at my chuck, I quickly took two fish, and was retrieving for another cast, when the hook caught, and at once there was a great commotion in the water.

To my astonishment I had foul-hooked the snake a third of his length from the end of the tail. He had not crossed to the other side, but had stopped to watch me fish, taking his position on a wisp of moss, abundant in the stream that year, whence, with the boldness of all wild things that know themselves unseen, he had looked on while I hooked and reeled in the first two fish. The third time, however, the fly came in directly across his back, and as he could not dive because of the moss, the hook took hold of him.

That was the first such experience in many years of fishing, and, I was confident, would be the last. But the next summer, under the end of Massanutten Mountain, I saw crossing the river a snake with such an ugly, lumpy head held so high, and swimming with such utter fearlessness in front of me, that for the moment I thought I had found a rattlesnake. He did not budge a hair's breath from his course for me, and made no attempt to dive when I threw the line over him. The hook took hold at the first cast, and I found presently that I had caught another water snake, with a frog half swallowed in his mouth, which had given the snake his lumpy head, and, apparently, his fearlessness.

W. H. Woods (D.D.)

Baltimore, Md.

A Day with Dog and Gun.

We start early, three men, two setters, Betty and Game, a bright morning after a frost. Fog lies in the lowlands, and in the leafless thickets of young birches, each bud and tip of branch holds a drop of water, and the sun-

"IN THE FIELD JUST BEYOND THE EDGE OF THE WOOD."

light causes the effect of millions of electric lamps pin-head size, wonderfully beautiful. Our hunting ground is along a discontinued railway, now a carriage road, on one side old fields and second growth birches, on the other meadows and a stream. We hitch the horse inside a tumble-down deserted house.. The dogs caper, wild with joy. Knowing the covers well, we hunt with system; soon the dogs scent game, and quickly locate. "Point," quietly spoken, is heard; every one is attention. The cover is thick; the shooters choose good

positions. The bird starts; nearly in front, "Mark," a fat woodcock scarcely topping the brush; one gets a fair sight; his shot stops the bird. "Charge, Betty," "Go on," "Careful," "Fetch," Betty brings in a fine 8-ounce bird. We proceed; others are pointed and retrieved; more get away, some missed, some not shot at. I engage in an old road. The others follow, with dogs "at heel." Keep quiet, this is a likely place for grouse. "Twit, twit." "Listen," I hear some grouse, just treed. They are within a rod, but hard to find. "Come on then, don't bother," say the others, and they pass on. Suddenly, whirr-r-r-r. Bang. I had a glimpse and aimed at where the bird ought to be. "He's down!" they shout. "Two went out over our heads." I reply, "O, ye of little faith." "Eternal vigilance is the price of grouse." Game saw it fall, and, demoralized, rushes for it, and fetches in style. We enter a cover of young birches. A woodcock goes up, wild, in the distance. I shout "Mark!" The man in advance tries the shot, and the bird falls, paralyzed. We expect to retrieve it at once, but neither dogs nor men can find it. The shooters "reckons he missed it." But no, I plainly saw the bird fall, riddled, and saw feathers fly. We discuss the matter, indicate the line of flight, and after careful search discover the bird hung up in a small fir tree. Other incidents follow; some of them comical; until we have birds enough, are weary and hungry ,and decide to return to the team. We call for a horse, make a fire among the roots of an old stump, in a field just beyond the edge of the woods; count and caress the birds, fourteen woodcock, five grouse; spread the carriage shawl for a seat, open our baskets, and, the coffee ready, devote ourselves to lunch. That over, we harness and take our way homeward, talking over the incidents and adventures of this and past trips, explaining why certain birds were hit and others missed, and agreeing that *next time* we would be so very careful, hold deliberately the aim on the birds, shoot straight, never miss.

F. S. DAVENPORT.

BANGOR, ME.

A Sunbonnet Vacation.

While Selina and I were walking in the orchard I had an inspiration.

I said, "Let's go to the mountains."

Selina has been on a trip to the lake, where it is so wide that you cannot see across it; but she has never seen a mountain; and she wants to see one as much as I do—which is pretty much. So we started up.

It was hard climbing, for we were determined to go to the very top. I slipped and fell twice, but caught on a limb both times, and one don't mind small bruises when she's climbing a mountain. Oh! but it was glorious up at the top with nothing above you but the sky and one little branch of leaves, only it made me a bit dizzy. I clung close to Selina, and she wrapped her arm about the little tree-trunk—you know trees are small at such a hight. How beautiful it was! I had never seen the ocean, and there it lay stretched before me; water, water, water, and so wonderfully blue. There was a lighthouse, too, and some distant white sails, and the pink of the setting sun was on the sails. It was one of those soft sunsets, when there are no clouds and all the sky is a pale pink, except where it is blue.

It was so quiet and solemn as the twilight came over the sea that I felt my heart growing big, and then I remembered that I had lied to Selina yesterday and something choked me. Her ear was close to my lips as we cuddled in behind our bonnets, and I whispered

SELINA AND I.

to her and asked her to forgive me, and she kissed me. It was a different kiss from any she had ever given me, and our faces got all wet with tears. It seemed as though a mist was rising over the ocean and there came a soft distant sound of the fog horn.

"Mother will not like it if we are late to supper," said Selina. So we hurried down and raced to the house, just as George was going to blow the horn again.

Everybody wondered where we had been, and I started to tell mother about it, but George hooted so that I stopped.

If George had been behind my pink sunbonnet and Selina's blue one, way up near the sky, he would not have hooted, especially if he'd had an inspiration the way I did—but, then, boys don't wear sunbonnets.

INEZ H. GODMAN.

MADISON, CONN.

Build Your Own Home in the Woods.

A recent article in a popular magazine has told in an interesting way how to build a home in the woods for $2,500. But $2,500 is a formidable investment for many families who might reasonably afford a modest summer home on a simpler basis. The rustic cabin pictured on this page was built and furnished, not luxuriously indeed, but with every necessary provision for comfort, at a cost of less than $500.

Here is the secret: Build your own summer home. Get one skilled carpenter, who will be able to work out the details of your plans, estimate the materials, and superintend the work; then employ a helper or two, provide yourself with a hammer, saw and square, and go to work. You will be surprised, if you are a professional or business man, at the amount of fun, as well as actual benefit, to be gotten out of a summer of carpentering. No need to work too hard; don't try to do it all at once; take one summer to get your building up, in the rough, well roofed and sheathed for the winter, then move into it the next summer, and finish it at your leisure. Make your own furniture. Rustic work does not require finished workmanship for artistic effect and real utility; the materials themselves, and they are available anywhere in the woods, have such intrinsic beauty that it is impossible to make anything ugly out of them.

This particular cottage, "Birch Cabin," Muskoka Lake, Ont., has a roofage, 32 by 32 feet, over all, and accommodates comfortably a family of six persons. It contains a living room, 16 by 16 feet; a kitchen, 8 by 14 feet; a porch dining room, 8 by 16 feet, and three sleeping rooms, not large, but perfectly ventilated, being unceiled and consequently sharing the air circulation of the entire interior. Partitions 7 feet high furnish ample privacy for family use, thus leaving each room open to the rafters, while ventilators in the opposite gables insure a constant fresh air supply.

The exterior of "Birch Cabin" is cased, up to the square, with hemlock bark, over rough hemlock sheeting. Any good well-cured bark will live in the weather almost indefinitely—fifteen, twenty years—and is easily workable in 4-foot lengths, such as may be had at very little cost, from any logging or bark operation. Slabs from the sawmills are all right, but the bark is more easily worked, and lives far longer after curing than if left unpeeled. There is a harmony about it, too, in the woods; the bark finish gives the cottage the air of being a part of its surroundings.

As for the interior finish, an endless variety of artistic effects may be worked out, with a little ingenuity, in the rustic. Following the

THE BIRCH CABIN.

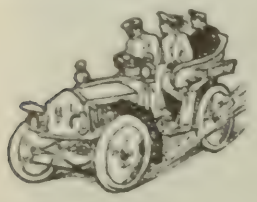
suggestion of a picture of John Burroughs' "Slabsides," we have wainscoted "Birch Cabin" with white birch saplings, which may be had for the cutting anywhere in the North country, and cannot be excelled for beauty of tint and variety of shading. Above the wainscoting the walls are lined, over the studding, with sheets of the birch bark, 2 feet square, and beaded with small hemlock saplings. Any one familiar with the delicate markings and matchless tints of the white birch can readily imagine the richness of this finish; pink, green, gray, snow white and jet black, more harmoniously blended than by any painter's brush; no tapestry could surpass it. Nature's looms are the best.

The same material, with just enough darker woods for trimming and beading, to maintain the contrast, may be worked into the furnishings of the living room—window seats, table, desk and bookshelves. A dark floor, oiled black birch, brings out the delicate tints of walls and furnishings. The old Dutch door, too, is sheathed with birch bark, and each half is a study in colors, framed around with a 12-inch border of the rich brown of the reverse side of the bark. No costly hardware adorns this door, nor unsightly castings, but a generous latchstring hangs through an auger hole and lifts the strong cedar latch, whittled from the branch of a neighboring tree. A great birch log serves as mantel over the rough granite fireplace. And this fireplace, and its rustic chimney, are the builders' special delight and pride; not only because they are unique and artistic, but because they are a complete success from a utilitarian and economical point of view. Such a chimney may be built for less than half the cost of stone, is equally durable and serviceable, and certainly not less harmonious in rustic surroundings. It is built of concrete, and may easily be duplicated by unskilled labor, with a little intelligent supervision A good-sized stovepipe in the centre for a flue, and, the boxwork of small logs make a perfect mold, and the finished result is as stable and safe as solid masonry. The stovepipe may rust out, and the logs may rot away, but that chimney will still stand, projecting into the living room, and its small maple logs, with rare markings and mosses, extending from the mantel up to the gable top, 15 feet, furnish a striking feature of interior decoration. The only requirement for skilled labor in the construction of the chimney is the shaping of the fireplace and the throat of the flue, to insure a good draft. The fireplace ought to be lined, of course, with fire-brick, as stone is liable to crack with the heat, but these need not be seen from the front, and much taste and ingenuity may be exercised in the make-up of that front. Almost any neighborhood will afford scope for the exercise of good taste in the choice of materials.

THE HOME-MADE FIREPLACE.

Just try the fun of building your own summer home; the result may not bear the closest technical scrutiny, but you will learn much that you did not know before of the various crafts, you will come home to your work stronger in mind and limb, you will save from one-third to one-half the cost, and, above all, you will have a home in which you will take a far keener delight than in one built and furnished by contract, however much more elaborate the latter may be.

JOHN M. WADDELL.



DOYLESTOWN, PA.

Try a Bicycle.

People who feel obliged to economize talk bravely of taking "a vacation at home." It is a delusion, there is no such thing. For vacation means "the act of vacating," so the first thing to do is to vacate—to get out, somewhere, somehow—only *get out*.

But how? Of the many kinds of getting out, or outing, which I have enjoyed, I will describe that which will appeal to the greatest number—the people of limited means and time. The best way for a man to obtain a maximum of outing with a minimum of expense and

time is to strip off all the starched husks of civilization, slip on an old suit and "tennis shirt," get the old bicycle out from the store-

room, oil 'er up, roll the few necessities of decency into a tight bundle with a repair kit, strap it on, and then pedal off in the crisp early air of a bright morning—free as a bird to go where you will. Care will fall from your shoulders like a heavy harness—how heavy you never know till you have set your face toward the open.

What shall be your route? Don't have any, shun it as the plague. It is the last tentacle by which the old routine devil-fish seeks to hold you—cut it out! Let the "wanderlust" have free range—"When the old spring-fret comes o'er you, and the Red Gods call for you."

On such a trip, of course, I never "make records" or cover distances—a double plague on them. All the same I know the joy to feel the flabby muscles tighten and gain tone like music-cords new strung to harmony, to see thin hands grow thick and ruddy with in-rushing blood—'tis "happiness enough" just to strain them open and shut with the long lost sense of a "husky" grip.

If you must have some rule, take this—Go till you feel like stopping. When you are tired, stop; if you see a lovely landscape, stop; if a squirrel tries to be sociable, stop and say "Howdy"; if a flower smiles up at you, stop and absorb it with the sunshine and the breeze; if a brook babbles and laughs, stop and "invite your soul." Commune with all things, and, above all, with your own spirit.

But take no book of verse beneath the bough, no jug of wine, no loaf of bread, and most of all, no "Thou"—where those things go, no real "vacating" goes. Nature is as jealous as any of her gender, she demands complete abandon to her charms, she brooks no rivals. Read no letters and no papers, let the world of men be as it were dead.

Meals you can pick up at farm houses for 25 cents, or a good story and welcome; bed and breakfast may be 50 cents, or even $1 if you luxuriate at a village "hotel." Such appetite, such sleep, such strength! How your soul expands and your horizon broadens! With wonder you recall that poor, narrow, harried thing which was you so lately. All too soon you wake to the cruel fact that your week or fortnight is gone, you have stretched your tether to the limit and duty snaps you back remorselessly to the old gold-quest. But you are stronger now and clearer-eyed. Mammon's mirages have lost their power to trick your soul, for you have seen and felt the things which are, and thru them you have glimpsed eternal verities of God, which ever lie behind and in his works.

(Dr.) R. W. Conant.

Chicago, Ill.

THE HOMEMADE HOUSE OF PICKED-UP STONES.

A Holiday House.

This is the way we picked up stones
And cleared the farm, and tired our bones;
All for to build a house and home.
Where frost nor wind should dare to come.
Two good feet thick the walls are made,
Instead of trees, to give us shade.
Water is brought from a mountain spring,
Where wild fern flutters and blue-birds sing.
No hired contractors bled our purse;
We did it ourselves—and might have done worse,
But why keep on with my little song?
Here is holiday all day long.

Caroline M. Brown.

Charlottesville, Va.

Quiet Dreams.

Why should we feel that we must "do" something on our vacations? We tear up the roads with our sixty horsepower cars; pack the steamers to Europe, and let ourselves be Baedekered about the Continent; "see America first" and rush from Niagara to Yellowstone, to the "Golden Gate," to the Colorado Canyon and wherenot, getting home out of breath; or if we have no bank account "chute the chutes" on every holiday, and then, during the week or two that our employer gives us, run about looking for pleasure at some hotel that is filled with others on the same quest. There are some who toil thru the brush after game or follow the lakes and rivers for the more or less invisible finny and scaly beasts; this is better, but the mental stimulation is still present.

Try loafing for once. Select the most out of the way lake that you can get to on your appropriation for carfare. Leave your fishing tackle home and take a few books, verse is best if you are fortunate enough to have a taste for it; if not, something else will do, but it must not be about the tariff or mining or banking; Joel Chandler Harris, Dallas Lore Sharpe and Bradford Torry are good; Thoreau or Van Dyke would be better, but perhaps not for the prosaic.

ALONE.

Row out to the middle of the lake, lie down in the bottom of the boat, and dream or read while you drift. Take an umbrella with you and if a shower comes up do not "pull for the shore," but watch while the land is obliterated and observe the delicious feeling of isolation that accompanies this sudden cutting off from humanity. Best of all, stroll along some night and gaze at the stars; reflect on the insignificance of the earth in the universe and your own minuteness on the earth; or regard it intellectually and consider the limited knowledge of humans and the probability that there are millions of inhabited planets, the very existence of which we are ignorant; perhaps the people love and hate and hope and despair; more likely they have emotions which we could not comprehend.

Dream away more time in the grove, where the mystic veery sings, and in the wood, where the plaintive pewee calls, and on the meadow, where the swallows flash about and twitter. The cynic will say that only the poet can enjoy this, and he is right. But nearly every man and woman has a poet buried somewhere within and they would be better and happier were the poet given a chance.

We should spend our vacations in some way that will ease the mental stress. Individuals may exist who would find misery only in such an outing, but experiment would convert many who think themselves in that class. I once saw it suggested that it would not be well for all of us to be Thoreaus, but it would be well if we all had a little of Thoreau in us; perhaps this might be amended by suggesting that the Thoreau which is within be developed.

EMERSON STRINGHAM.

NEW YORK CITY.

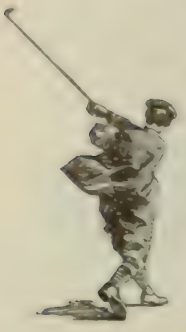
Building a Motor Boat.

The development of the gasolene engine and the comparatively reasonable cost of the marine type of engine suitable for a small power boat, have made motor boating wonderfully popular within the past few years.

Up to two years ago, I was one of the set of distinctly salt-water sailors who could imagine no pleasure in a small boat other than a staunch knock-about or Cape Cod cat.

I had spent many a vacation with these old friends and well remember my disgust when the fishermen began to adopt the gasolene engine, and I could hear the exhaust sounding over the water to windward almost before the offending catboat was sighted.

Unfortunately, my home is inland, where the only available waterway is the Merrimac River, on which sailing is out of the question.



In the spring of 1906 I was somewhat out of health, and needed regular exercise. This, together with my love for boats and the fact that I could not get to sailing water daily, determined me to bury my former prejudice and build a power boat.

As labor is quite a large part of the cost of a boat, there is a very considerable saving when one can build his own.

Now, to build a boat seems to many an impossibility, but to one accustomed to the use of tools, the successful accomplishment is almost assured by the aid of any one of several of the pattern systems which are so much advertised, and by the use of which many amateurs are today building their own craft.

With these full sized paper patterns for each part of the boat, and the de-

tailed directions as to how to proceed, illustrated with cuts of the boat in each different stage of completion, the difficulty of "laying down the boat" from naval architects' plans and tables of offsets in the way followed by professionals, is obviated, and the man who is ordinarily clever can construct a good boat.

There is a tremendous amount of exercise in the sawing out, planning and fitting the frame, planking, decks and inside finish of a twenty-three foot boat.

It is a form of exercise which becomes more and more a recreation as the hull takes shape. The task is so absorbing that business is quite forgotten during the hours of work, and the mental relaxation perfect.

I installed in my boat a seven horsepower two-cylinder engine. The boat was not designed for speed, but rather for staunchness and carrying capacity. Nevertheless, she made from eight to eight and one-half miles an hour.

I was fortunate in my choice of an engine, as it was a consistently reliable one, and thru the last half of the summer my boat was running nearly every day for several hours.

I used a submerged exhaust which did away with the noise and odor of gasolene, and I must admit that while I still have my old love for a cracking breeze and lee rails awash, I have become a convert to the power boat for inland water.

Much as I enjoyed the actual use of the boat, however, I cannot overstate the pleasure I took in the construction work. It was of inestimable value from a standpoint of health, and I look forward with much pleasure to building again sometime.

MANCHESTER, N. H.

Camping in the Bad Lands.

There is perhaps no summer outing which I recall today with more pleasure than a certain camping trip on the White River and skirting the Bad Lands of South Dakota.

It was not exactly a vacation trip, for I was traveling from one reservation to another as Supervisor of Indian Schools, with the team and outfit provided for my use by the Indian Department; nevertheless, there was sufficient opportunity for the fullest enjoyment of the bracing out-door life and striking scenery.

My Indian pony gave me all the exercise I wanted, and I changed, at pleasure, from the saddle to the roomy back seat of my commodious mountain wagon, whose excellent springs afforded easy transit over the roughest roads. The front seat was occupied by a young married couple, my Indian driver and housekeeper, who cared for the horses and made me entirely comfortable in camp.

I had chosen the conical Sioux tepee, with its provision for a cosy central fire, rather than the somewhat cheerless and unpicturesque "wall tent," and my outfit consisted of little more than a well-filled mess chest and plenty of blankets. "Camp furniture" of any sort, beds, chairs or stoves, was always an abomination in my eyes! It is such a luxury to abandon oneself to the lap of Mother Earth for a season! and our plain fare, the wild game, wild fruit, dried meat and "fried bread" of the native woman, eked out with such simple luxuries as coffee, tea and bacon, taste so much better than an elaborate commissary!

No one knows so well as an Indian how to secure in the simplest and most direct manner all essential comforts in camp, to make the tent wind and water proof, to adjust needed shade or warmth to a nicety, and, above all, no one else is so thoroughly at one with Nature, and able by his leisurely manner and restful mood to complete her good offices. He is always good company, but never obtrusive; his silence is as agreeable as speech, and the very look of him is harmonious and satisfactory!

The upper White River basin, in South Dakota, is a region much exploited by the geologist and fossil hunter, and well worth a visit by the traveler in search of a novelty. Its fantastic bare buttes of brilliant coloring and distinct stratification fairly fascinate the eye, and especially at the sunset hour, from a little distance present the wraith of a ruined city, with its temples, towers and spires rising from chaos! There are lofty plateaus that are nearly or quite inaccessible, and with some of them romantic episodes are connected. Only a few months after my visit, the Sioux "hostiles" of the "Ghost Dance War" entrenched themselves for several months in the natural fastnesses of these Bad Lands.

PINE RIDGE INDIAN TEPEES.

A Vacation with Bees.

A vacation question confronted me, interesting from its apparent difficulty of solution. What kind of live stock could I have to amuse, instruct, and profit me in my holiday? Conditions as follows:

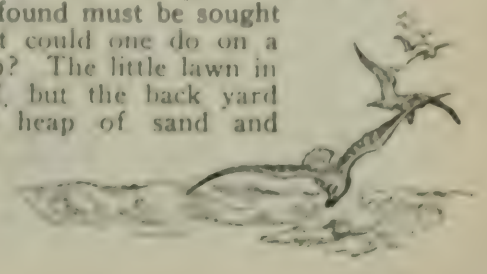
I, being a literary woman, spend six months in the real country, on my little farm of half a dozen acres (let grow sweetly to golden rod and old apple trees), and six months in the City of Cities, where is my market. Now I leave it to you: What live thing can I own? Think of my possible pig after a six months' fast! Of my chickens after the same period of neglect! No, it would not do. At last I discovered the answer—*bees*.

A year ago last fall I bought two swarms, moving them late in October to my estate,

"I COULD HANDLE FRAMES COVERED WITH BEES QUITE CALMLY."

where I proudly established them under a friendly apple tree. So much for the bees. My state of ignorance about their ways and needs was monstrous. Books? Yes, I read bee books. They were good books, and taught me how much there was to learn. The first of the following May found me rushing back to my farm and making, even before I unlocked the house door, an inspection of my precious hives. What was my delight to see bees—my bees—going in and out of their doors, buzzing pleasantly in the May sunshine. I had provided myself with bee veil and smoker, and soon knew the inside as well as the outside of the hives; could handle frames covered with bees quite calmly, and manage supers with an experienced air. In praise of the bees I will say that they were very patient with me, and excused my greenhorn ways. One colony swarmed the 15th of May. I carefully hived the swarm, with my friend, the bee book, in one hand, only to find, in a few hours, that they had all returned to their old home. Desperate consultation of the book followed, and resulted in the conclusion that the queen must have been clipped and so could not fly

HIVING THE SWARM.



with the swarm. In a few days out they came again. This time I found the lady hopping about in front of the old hive. Having carefully put her into a little box, I again hived the swarm, letting her loose among them as they ran into the new home. This time they were quite content. My first vacation with the bees gave me much instruction, much pleasure, 150 pounds of honey, and very few stings.

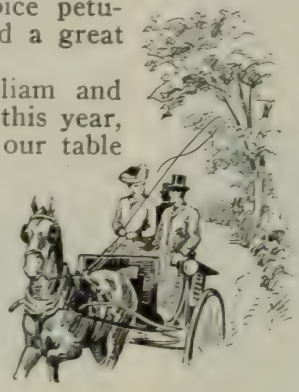
POMFRET, CONN.

Raising Flowers in the City.



My summer vacation last year began in April. It was like this: There would be no money for a trip. It was plain that what recreation was found must be sought at home. What could one do on a city lot 37 by 90? The little lawn in front was good, but the back yard was a sloping heap of sand and ashes infested by quack grass. I de-

cided to raise flowers. A few loads of top dirt helped the lowest part of the lot; a load of fertilizer over all was spaded into the ground; and then I proceeded to lay out my garden.

The whole end of the yard was taken, making a plot just about square. Along the little fence at the rear and sides I sowed nasturtium seed. By the middle of July the fence was hidden by the beautiful green leaves and the blazing red and yellow blossoms. Two unused clothes-line posts with cross-arms, in time were festooned with flowering pea and morning-glory. The effect was such that a friend accused me of ritualistic tendencies because of my decorated crosses. Close to the screen formed by the vine-covered fence dahlias were planted at intervals. Two long beds next contained gladioli, that furnished great bunches for church from the last of July until same time in September. There is nothing easier to raise that will give more pleasure. Four other beds and narrow borders on the sides contained sweet alyssum for edging; candytuft, white, lavender, and purple; portulaca, red and yellow; California poppies, yellow and white; verbenas, many shades, some very fragrant; brilliant zinnias; choice petunias; besides snapdragons, asters, and a great display of marigolds.

In addition, I started Sweet William and Canterbury Bell, which will blossom this year, and raised enough tomatoes to keep our table well supplied and fill a number of cans for winter use.

The amount of shoveling and spading in April was heavy, and good for back and arms. The quack grass was hard to keep down, but I succeeded. My health was in as fine trim as if I had tramped thru the Adirondacks in the summer months, and I learned many a lesson of nature. Some of the soil was very poor, yet water and cultivation produced the gayest results.

Some of my friends were at Northern Michigan resorts, some in the woods, some at the seashore, and some were touring Europe. But in the hot August days my mind was rested and my heart freed from care as I looked at my garden, or showed it to others, or by means of its blossoms gave some invalid a glimpse of its beauty.

WILMOT E. STEVENS.

GRAND RAPIDS, MICH.

An Enforced Vacation.

My vacation commenced the evening of February 1st, just after I had given our few cherished and companionable hens their evening meal and tucked them snugly into their roost.

The vacation was not premeditated, so I lost the pleasure which comes from realizing a long cherished plan.

There was a beguiling thaw at hand and a sneaking bit of ice under water lurked at the backdoor step. Suddenly, very suddenly, something happened. Wondering at it I tried to rise. My feet, always so ready to do my bidding, utterly refused to get under me. I had not lost my voice with my balance, and I loudly summoned the public to my aid. Out of the gloaming a stout young man appeared (bless him), and without parley or an introduction carried me to my fireside. My vacation had commenced—with a broken hip. The "complete rest," which I had thought forbidden by household cares and a meagre purse, was now made possible. A famous surgeon was telephoned for from a distant city, and after his skillful and delicate manipulations, the sunniest upper room was placed at my disposal. This was my private car. The tour was a personally conducted one, too; a nurse being in constant attendance. By a clever arrangement of mirrors I was enabled to keep in touch with the street and many an acquaintance stopped to wave the hand or raise the hat at the psychological moment when my mirror should command the sidewalk, tho the answering wave of the hand could not be perceived.

Friends from the countryside, for miles around, heard of my condition, and there came to me a "shower" of dainties equal in variety and extent to those designed for the modern bride-elect's dowery chest. The greenhouses furnished their best violets and carnations for my enjoyment and primroses and hyacinths bloomed continuously in the windows. Literature the best, and the latest, which is not always the best, found its way to my table. Every mail brought loving messages from dear and distant friends. Seldom was I left to remember that I was lonely. Day after day friends brought their merriest moods with which to entertain me, and there were those who came and said little, with Dr. Van Dyke "counting that friendship little worth which has not many things untold."

Tonight the surgeon comes around again to cancel my trip ticket. It was good for three months. What I have learned from this vacation might not prove of interest to the tired world looking for recreation. I look at my fellows with different eyes: See under the commonplace indifference, hearts beating with quickened sympathies and generous impulses. I think of the excursion across the Continent which might have been substituted for this vacation of entire rest at the same pecuniary outlay, and I put beside the thought the vision which Browning has made vivid in the words:

> "God's goodness flows about our incompleteness,
> Around our restlessness, God's rest."

(MRS.) EMILY C. HEDGES.

BRIDGEHAMPTON, L. I.

Two Women and a Tramp.

Not long ago a friend and myself took a walking trip, which was at the time, and has been ever since, a source of satisfaction and delight. The region we chose was the Berkshires, the time early June. We began our wanderings at Great Barrington and ended

them at Williamstown, two weeks later. We walked about 115 miles, averaging 8 miles a day. We went up Monument Mountain, and did Greylock very comfortably by spending the night at an inn on its summit.

Many questions present themselves to the minds of those who have never had such an outing:

1. How did you go about finding comfortable and safe places for over night?
2. What did you do about your baggage?
3. Weren't you in danger of getting lost, or of wasting time by taking wrong roads?
4. Was it safe for two ladies to go wandering about the country like that?
5. Why didn't you make it a trolley trip? And so on.

1. We always managed to arrive at a town in ample time before dark to look up a stopping place. We made our inquiries at the railroad station or post office, and rarely had to go beyond the first address given us.

2. We sent our two dress-suits cases on in advance from one town to another, checking them on a mileage ticket. Twice we had to pay trifling express charges on them.

3. As to getting lost, we put little trust in our sense of direction, but made constant use of maps and guide posts.

4. Was it safe for two ladies to go alone on such a trip? It certainly was, perfectly safe. To be sure, there was one cow—but after all she probably didn't mean it. The only time any one was scared was when we scared two lone women in a farmhouse by asking if we might buy a quart of milk.

I wish more persons who are fond of walking could be persuaded to take this kind of vacation. The freedom and independence of it are perfectly delightful. To be sure, there are tired times, but what pleasure there is in that, too, knowing that only our own two feet will take us to the enjoyable supper and the sound sleep that will end the day.

MARY LESLIE IRWIN.

NEW YORK CITY.

A Youthful Camper's Letter to His Sister —Unrevised.

We got to Skunk River about noon and dumped our junk. We put up our tent and started a big fire and cooked our dinner. Our meals were usually froglegs, potatoes, bread, eggs and fish. We made a thing to hold the bucket we boiled the coffee in out of two forked sticks with a green one across so it wouldn't burn easy.

It rained about a half hour after we got our tent up. It rained harder than I ever saw it before, and there was lots of lightning and thunder. The rain came thru our tent and we thought it was because it wasn't tight enough, so we tightened it up till you could play a tune on it, and it came thru worse than ever. We didn't know that you ought to loosen it up. We got mighty wet, and that night, when it stopped, we built a big fire and dried off.

Some of the kids went to bed and we waited till they got to sleep and then sneaked up and shot both guns and ran into the tent and told the kids we saw two ghosts and pretended like we were scared. Pretty soon they went out and saw the ghosts were two dead trees, whose bark had dropped off, and the moon was shining thru the trees on them. Then no one got to sleep till after 1 o'clock, for they all raised the dickens and hollered and laughed and pulled the blankets off of each other.

We had a big fish on one of our lines one morning and monkeyed about a half hour trying to get him, but he was too big for us, and at last broke our line all to pieces. I had hold of him once or twice, but couldn't hold him. If I had got my fingers in his gills he would have been a goner. I think it was a buffalo, as it was good 3 feet long. It was the biggest one I ever saw. Our lines weren't heavy enough for those kind of fellows. We are going to take heavier lines next time.

"A BUNCH OF KIDS."

We had one of the kids scared to death because of an owl that screetched every night. We told him it was wolves. We saw lots of snakes and killed several. The snakes were almost all garter, altho some of the kids claimed they saw two rattlesnakes. We shot lots of squirrels. The mosquitoes about ate us up, but we had so much fun we didn't mind a little thing like that.

We done so much I could write a week and then not tell it all. You know that a bunch of kids can always have a good time anywhere like that.

CAMPBELL WHITHAM.

FAIRFIELD, IA.

A Farmer's Vacation.

One evening after supper I said to my wife, that it would be pleasant to have an outing and see some friends in our native country; so we boarded the train for New York. We wanted to see the great city of Paris; so we took the ocean steamer for Havre; thence up the Seine to Paris. While there I obtained an audience with Phillippe Bunau Varilla. I asked him if he thought the Isthmian Canal would ever be finished. He said his experience for a num-

ber of years as head engineer of the project has made him doubtful of its ultimate practical value, even if it would be possible to accomplish it; otherwise he would not have engineered the Panama revolution; nor would he so readily have loosened his pursestrings to Uncle Sam's officials for protection of the Junta. Europe is not interested in the project because to the whole of Eastern Asia and Australia, inclusive of New Zealand, the way via the Suez Canal and the Indian Ocean will remain much the nearest.

From Paris we went to Hamburg; from there up the Elbe to Lauenburg, where I, as a young man, worked during the French-German war. There I met a few old friends and veterans, who still remembered many incidents that happened during that time; but their political views are much different from what they were in the days of Bismarck. From Lauenburg we went to Malmö, Sweden, our native country, from where we proceeded inland to Wittsjö, where we spent our childhood days. To describe the changes made during our absence would make the vacation story too long. From there we went to Stockholm; thence to Göteborg, via Göta Canal, where we again boarded the ocean steamer for our homeward journey. After reaching New York, I met E. H. Harriman; I asked him if captains of industry had come to an understanding with Roosevelt. He answered me quite short, and said this world is a checkerboard and a player must figure on giving one and taking two. I also met John D. Rockefeller, and in our interview he concluded, thus:

C. J. CARLSON.

"These riches are possessed but not enjoyed,
My acts, the copious theme of every tongue;
How favoring Heaven repaid my glorious toils,
With a sacked palace and barbaric spoils."
"Oh! had but God so large a boon denied,
And life, the just equivalent supplied."

Starting from New York for our home, in Nebraska, we were to go by Washington, D. C., there to spend several days in the city of magnificent distances, seeing the ever-changing sights, studying the political situation, watching the machinery of government, carefully observing the notable men in the public eye, and, as an incident, to seek an audience with Theodore Roosevelt, and go over with him many governmental problems; but then I awoke and heard the pigs squealing, the horses pounding on the mangers, the cows uneasy because it was six o'clock in the morning, one hour past the usual milking time. Such the farmer's vacation.

"Mine the care to feed the bristly kind,
Each day the fattest bleeds of either herd,
All to the suitor's wasteful board preferred."

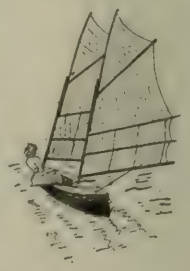
C. J. CARLSON.

WAHOO, NEB.

Junior Forestry.

My "forest" is about three acres in extent. It consists of young poplar, cherry, maple, hemlock, and red and white oak. The soil is mostly clay, and perhaps one-fifth of it is swamp land.

When I first came into possession of the little wood-lot, three years ago, my first proceeding was to lay out and clear a good system of paths (I called them "trails"). The two principal ones are now known as "acorn" and "chestnut" trails, from the nuts planted along them.



The paths intersect each other near the middle of the forest, and at their junction I built me a camp of boards and paper. It was small and shabby, yet very cozy and a good shelter. Here I have spent a great many pleasant hours, reading, writing or studying.

This has been my "forest policy": (1) To encourage all young growth and keep planting more; (2) to prune and thin judiciously the trees already growing; (3) to provide as good drainage as possible.

At first there was not a single pine tree on the tract, and I determined that there should be; so, in the fall of 1905, I set out fifty white pine seedlings, averaging about 1 foot in hight. These were good, healthy specimens, procured from nearby fields. They were scattered thruout the "forest," wherever there was a favorable spot. The next spring I planted 160 more, making a total of 210. At present a close inspection shows 60 seedlings alive and thrifty. This is about 28 per cent. of the whole number planted, and it seems to me as I write that it is a very fair result, judging from what I know of the work of others along similar lines.

All spare time during this last winter was spent in trimming and pruning the young oak and hemlock trees. I would go out to the woods after school hours or at odd times and work at them. The method of procedure was to select a tree, thin out other needless or injurious growth nearby, and then prune the tree itself, always cutting away branches carefully with a saw. By simply utilizing odd hours in this way, considerable has been accomplished, and my "forest" certainly improves, both in looks and in growth.

This little forestry practice has always been, to me, one enjoyable and profitable way of occupying vacation time. It is especially pleasant if one is a lover of nature, for it brings one closely into touch with all wild things. And what is more, the work in the woods affords one real recreation, yet at the same time excellent physical training and useful education. ALBERT B. GENUNG (age, 16 years).

FREEVILLE, N. Y.

"THE CURVING STREAM WITH SLOPING MARGINS SET."

Trout Fishing.

This luck be mine! Upon a morn in May,
In some secluded glen where alders hide,
Beside a brook, with rod in hand to stay,
And whip the waters where the trout abide!

A curving stream, with sloping margins set
With meadow grasses, peppermint or cress,
Whose amber eddies gently sing: *"Forget,*
Forget all toil—in rhythmic loveliness!"

What care to choose the fly! What eager zest
Attends the making of the maiden cast!
A tangled line—that gives the patience test,—
A thrill, a nibble, and a trout at last!

The wrist's shrewd turn—that hooks him, past a doubt,
And then the careful play of rod and reel;
A scoop-net deftly lifts the fellow out,
A flecked beauty for the morning meal!

Another lurks where queer raft-spiders skim,
His fellow leaps from out a rock-paved pool;
A swirling rift or sunken, sodden limb
Yield treasure-trove. Heigh-ho! The basket's full!

A cracking fire! Potatoes roast in sand,
Trout broil on live coals ('tis a woodman's way!)
The coffee's bubbling. Do you understand
Why I prefer the woods this morn in May?

SARANAC LAKE, N. Y. ERNEST NEAL LYON.

Referred to Mrs. Grundy.

Formula for an Ideal Vacation:
Five boys.
Five girls.
One roomy mountain cabin, well fitted up, and not too far from civilization.
No hired servant.
No chaperone.
A moderate amount of work for every member—zoology, botany, writing, or the like.
An unlimited amount of good spirits—non-alcoholic, of course.

I realize fully that five dollars is a paltry sum to take for a discovery as great as this one. But, like the patent medicine man, I live but to relieve the woes of humanity. To all who want a long and pleasant vacation that is moderately wild and woolly, I recommend my formula with perfect confidence.

Remember, first, that your group must not be composed of all boys or all girls, for it would be likely to break up in three weeks. A certain amount of company manners, you see, is absolutely requisite to preserve peace and harmony.

The second thing to remember is this: If you can possibly avoid it, young folks, *don't* take a chaperone along. The chaperone of your wild and woolly vacation is apt to be the most lonesome and miserable woman imaginable. She can't help but act as a damper on the spirits and jollity of the party—a damper that is apt to make the boy half of it smoke! Chaperones are old-fashioned encumbrances anyhow, and resourceful, self-respecting, twentieth century young people according to Western ideas don't need more than the semblance of them.

We had no chaperones. We had understood in the first place, that we would be watched over by a professor and his wife, who lived a short distance down the mountain. But they were far from old themselves, and declined the work, if not the name, of chaperonage absolutely. In fact, whenever the good souls called on us from a sense of duty we behaved on general principles much worse than when we were by ourselves.

Ideal vacations have to be cheap; the hiring of help to do the cooking is not at all cheap. We did our own cooking, and got an immense amount of fun out of it. Scalloped glue and cheese, biscuit paste, liquid gelatine, and such dainties were only jokes when we ourselves were responsible. "Whoever kicks on the cooking has to cook for a week," was our one and only rule, and it was never broken. Altogether we had a wholesome spirit of brotherhood and sisterhood that made our vacation ideal indeed.

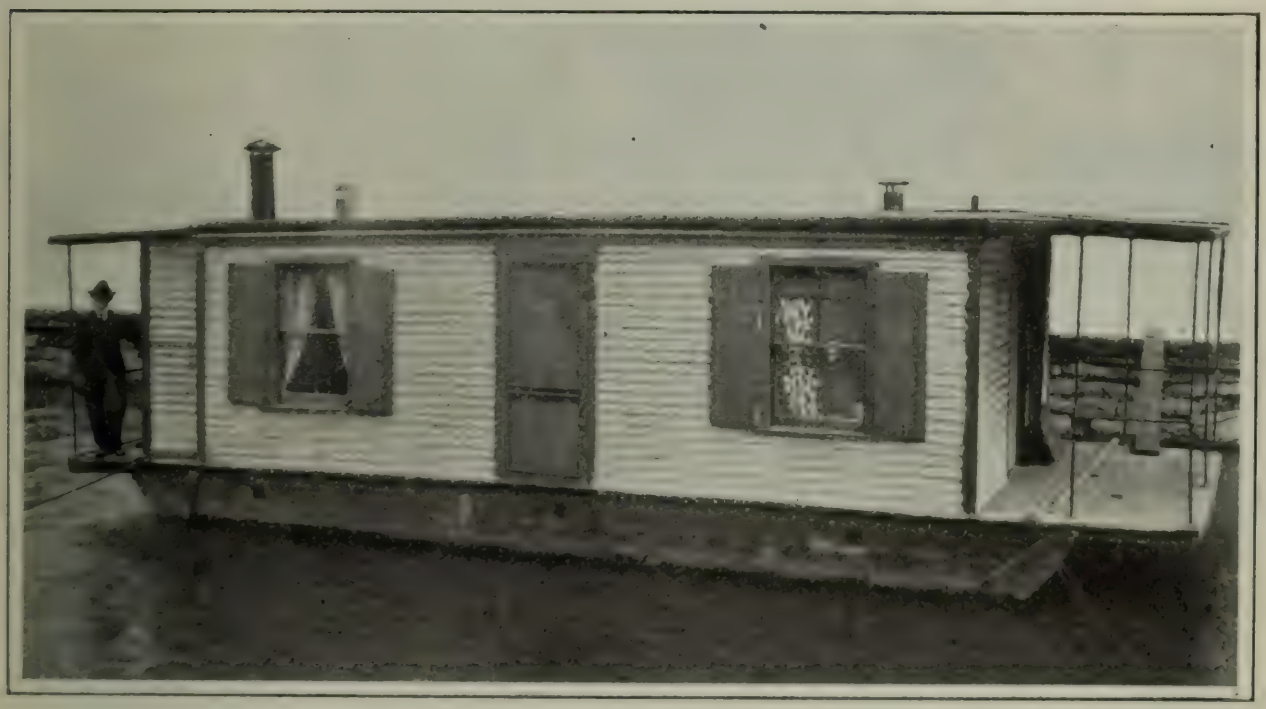
A Summer on a Houseboat

BY GEORGE ETHELBERT WALSH



THE popularity of the houseboat as an adjunct to our summer pleasures steadily increases with the improvements made in this type of craft. Even the objection (very serious to some) that the houseboat could not change its position without the expensive services of a tug or other power-boat has now been overcome. Small motors, costing as low as $50 to $75, are installed in many of the houseboats, making it possible to make such suitable changes of location as desired. These motors, ranging from two to six horse-power, do not by any means convert the houseboats into what are commonly designated as power-boats. The motor cannot propel the craft at a speed of more than two or three miles per hour, but that is sufficient for all essential purposes.

The remarkable popularity of the power-boat, indiscriminately called motorboat, has made life on a houseboat a luxury never before considered possible. With power-boats costing $100 and upward, the owner of a houseboat is provided with his own tug, runabout and fishing craft. A power-boat sixteen and eighteen feet in length can tow a houseboat thirty feet in length at a speed of two or three miles per hour.

Last summer a party of four spent a vacation on a houseboat, which they rented for the season for $100. A small twenty-foot motorboat was purchased second hand for $150, making the total investment less than $65 each. For this small amount they had a floating furnished cottage and a runabout to take them from one place to another. They spent $25 for fuel for running the motor-

boat and nearly $25 for mechanic's hire and extras for keeping the machinery in good condition. Their total investment amounted to no more than the price of a furnished house at any seashore or mountain resort.

They started the season in June by towing the houseboat twenty miles up the Long Island Sound and anchoring it in one of the delightful coves which fringe both shores of this large body of water. They could keep in close touch with the city by running ashore every day in their small power-craft, and when business demanded their presence in the city they

either took a train from one of the nearest towns or made an all-day trip of it in the motorboat. When business did not call them away from their pleasures, they spent their time idling on their floating home, camping on the beach, fishing or motoring up and down the Sound. They kept house in turn, each being responsible for the meals for a full week. Instead of proving irksome this "playing at housekeeping" provided no end of amusement and relaxation. There developed such possibilities in this form of summer outing that they decided to repeat the experiment another summer.

The houseboat of today varies in size and luxury from the small twenty-foot craft with canvas top and sides up to the ten-thousand-dollar floating palace with all the equipments which unlimited wealth can command. The day of converting the old, clumsy canalboats into houseboats has apparently gone, and these old, abandoned hulls are no longer picked up by the amateur for this purpose. At their best they were never suitable for houseboats. They were too bulky and unwieldy, with an enormous amount of waste space below decks. Houseboats are made today after patterns that can be followed by almost any amateur boatbuilder. They have square ends and sides and shallow depths. They are built to furnish ample deck room and nothing else. The old lumber scow is probably the best standard type of flat-bottom, square-stern hull employed for this purpose. Knock-down plans for such simple structures can be put together by amateurs for less than $25.

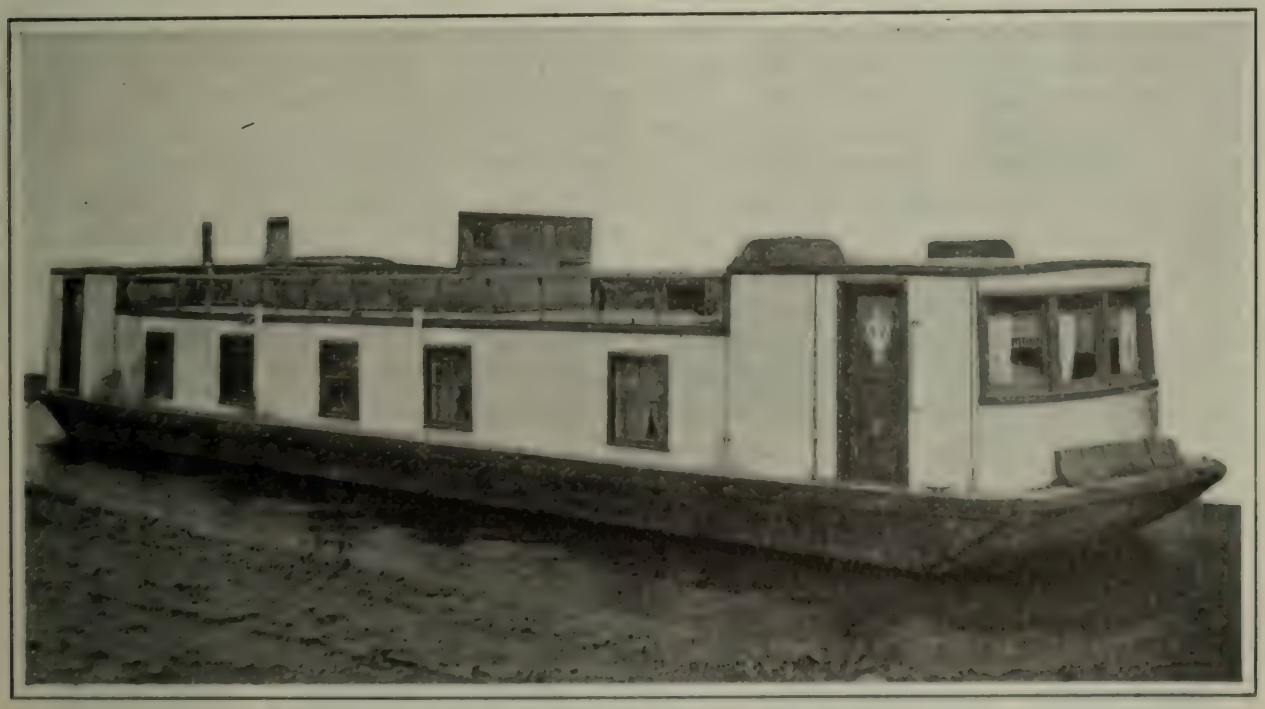
A simple houseboat which a great number of campers in the lakes and rivers of our country use for their summer vacation is made of light spruce or butternut woods, with the main deck only fourteen to fifteen feet over all and ten feet wide. The superstructure is made

of waterproof canvas stretched over a framework of wooden beams and upright posts. It is practically a tent pitched on the deck of a cheap, flat-bottom scow. But what comfort and pleasure there may be derived from such a houseboat? It is far ahead of a camp erected in the woods or on the flat rocks. a family of two or three can be accomplished for less than $75.

Model houseboats ranging in size from twenty to fifty feet in length and proportionately broad, capable of accommodating from three to ten people comfortably, can be constructed at prices ranging from $75 to $800. Everything

A CHEAP, HOME-MADE HOUSEBOAT ON THE ERIE CANAL.
It is 20 feet long, and made of soft wood, total cost less than $100. It has accommodations for a family of four.

It never stands in floods or freshets, and during the rainest weather it will shed the water easily. The camp can be moved about from place to place without taking down the tent. A small rowboat or skiff pulled by one or two good men takes the place of a tug or powerboat, and the light draft of the houseboat makes it possible to anchor in very shallow, protected water. On such a craft many of the uncommon luxuries of camping can be stowed away. A good oil stove serves for cooking; comfortable beds or folding cots invite slumber at night; pots and pans which would prove a burdensome nuisance in a tent on shore are stored away in neat canvas closets; and a few bits of luxurious furniture like rocking chairs, hammocks and even a sofa and desk help to make life homelike. The complete manufacture and furnishing of such a summer home for depends upon the appointments and construction.



A twenty-foot houseboat with a canvas superstructure can be built for $75 to $150, according to finish and cost of material. The hull should be made of white pine timbers, three by four inches, and twenty feet long, laid two feet apart. The lower part of the hull should be made of timbers sixteen feet long, so that at bow and stern there is left a slant of two feet. The bottom and deck timbers should be separated by two-foot studs every two feet. The timbers and studs should be screwed together, and then the sides made of three-eighth inch pine or spruce. The seams of the sides and bottom should be calked, red-leaded and puttied until perfectly watertight. The outside should be painted two or three coats of any color desired. The inside of the hull should be strengthened

by cross-timbers every four feet, and two full-length timbers should pass down the inside.

The deck flooring can be made of any cheap or second-hand lumber. Over this stretch canvas, and paint to make it watertight. It is cheaper than a deck of matched lumber. The superstructure is made next. Side timbers, three by four inches, are laid on the deck and bolted in position. At either corner bolt upright posts to the floor timbers, and secure by light roof beams. Supporting upright posts should be erected every six feet the full length and width of the deck. The crosspieces and roof beams can be made of pine or spruce sticks two by three inches in size. When all are nailed together they form a rigid framework for the canvas. Frameworks for the doors and windows should be made and placed in position. Then a light waterproof canvas should be stretched over this framework and tacked down with large headed galvanized tacks. Seams must be overlapped. Two coats of paint over the canvas superstructure will make it waterproof.

Another method of building houseboats by the amateur is to select two flat-bottom boats and fasten them together with crosspieces of light timber, forming in this way a flat-bottom catamaran. The deck is made by laying timbers across from one boat to the others and building the superstructure of canvas or wood on top. Two flat-bottom rowboats, fourteen feet in length, can be used in this way to good advantage, and as these craft can often be picked up for a few dollars apiece, the hull of the houseboat is made without much trouble or expense. Such a catamaran houseboat is eminently suited for our quiet inland waters, and it will easily serve as a pleasant, safe and comfortable home for three or four months in the summer.

In houseboating it should be remembered that life ashore and afloat are to be blended, and that the chief object is to live outdoor with all the pleasures of camp life and the comforts of a summer cottage. It combines the joys and experiences of yachting with those of the still camp life. But the yachting side of it is not of the exciting order. If this is desired there should be attached to the houseboat camp a sailboat, motorboat or similar craft of speed. With any one of these it is possible then to make excursions to many parts of the country, returning only to the houseboat at night to

A RATHER LARGE BUT SIMPLY MADE FORTY FOOT BOAT.

With an observation compartment in front. It has an upper deck, but awning and supports are not in position in the picture.

sleep or for meals. The rowboat or skiff is essential if the power-boat is not provided, for there are provisions and water to get, and trips to be made to the mainland at points where the water is too shallow to permit landing from the houseboat. A good serviceable skiff or rowboat provided with a sprit sail generally adds to the comfort of the vacation. When going with the wind a sail will save many a weary mile of hard rowing and permit blistered hands to heal.

The advantages of a houseboat are many over that of a simple tent pitched even in the prettiest corner of a bay or on the most commanding and picturesque side among the mountains. It is possible to entertain friends and city guests with the minimum of labor. There is the spare cot or bedroom for their accommodation, plenty of cooking utensils, and a good stove that you can depend upon. If it rains during their visit a small, but carefully selected, library of books and magazines will make indoor existence less monotonous. The houseboat is lighted with kerosene lamps just as completely as the summer house, and if doors and windows are screened mosquitoes and flies will not prove annoying. Even in rainy weather the occupants of the houseboat can fish without moving beyond the shelter of canvas roof. One may even enjoy fishing thru an open door or window without moving from a comfortable couch or hammock. The thrilling chapters of a popular novel, read while reclining in a hammock, may be punctuated by "strikes" which will make the blood run hot with expectation and result in providing the table with fresh fish. Games can be played in the houseboat on rainy days that are practically impossible in a tent on shore. These and many other advantages recommend the houseboat to camping in tents or to almost any other form of outdoor existence.

Life on the houseboat is a wholesome escape from all the commonplace events of boarding-house and hotel existence. The fitting up of the craft, the choosing of the different anchoring places, the mere cooking and housekeeping on board, the daily changes of sports and pleasures on the water, the periodic trips to other scenes, and the thousand and one little adventures which constitute the life afloat and ashore lift the mind out of ruts, while the body is strengthened and toned by physical exercise and daily contact with the air and sunshine. There is no monotony, except the monotony of pleasurable enjoyment of rest and change. One is free from the little unsanitary dangers which may threaten life in rented summer cottages or camps on shore, and the nomadic life on the houseboat gives the mind something to look forward to each day in the week.

New York City.

Good Fishing

BY THE REV. W. J. LONG

[We are fortunate in having in this issue articles by Mr. Burroughs and Mr. Long, the opposing champions in the current debate on the psychology of the lower animals, in which President Roosevelt has lately taken an active part by classing Mr. Long and other gentlemen as being addicted to unqualified and deliberate statements.—EDITOR.]

THERE is one curious thing about fishing in the North Woods which the guide books have not yet mentioned, namely, that wherever you go the good fishing is always seven miles farther on. You read roseate accounts of big trout and abundant fishing, and the fever stirs within you. You begin to dream dreams; you save your money and get your tackle together. You ride long, tramp hard, cross a river and three lakes, and finally get to the place. And you catch chub, or fingerlings. It makes no difference where you are, down the Penobscot, up the St. John, the story is the same; you are disappointed, till your guide tells you enthusiastically of a famous place about seven miles from here where there is always good fishing. To reach it you get up early in the morning, climb a mountain, crawl thru an alder swamp, get wet, hungry, fly-bitten; and again chub and fingerlings. There is another place seven miles farther on; but don't go. The fact is that there are trout in all these places; that they come to the surface in the spring and are easily caught with pork or red flannel; and so inspire the camps and railroads and offer golden promises. In summer the trout vanish, and not one guide in a hundred can give you any help in finding or catching them. There is a place seven miles further on—but enough! This is to suggest that you may stay where you are and have the best of fishing.

Let me begin the story with a confession and a heresy: I like still-fishing, and that is the confession. It will make every member of the Fly Brotherhood look at me sadly, thinking of the classic definition of fishing as "a pole and line, with a fish at one end and a fool at the other"; which, of course, does not apply to the delicate art of fly fishing. But still-fishing is also an art, a fine art, in its perfection a greater art than fly fishing. That is the heresy; and even to whisper it is like dangling a Red Ibis in front of a bullfrog. "Bait fishing? bah!" To catch such a fellow, to spill his bait, and burn his gear at the stake, and eschew his company, and blackball him at the new Catchumalot Fishing Club is what the Brotherhood would like to do. Instead, they glance under the canoe seat, where the broad tail of a trout sticks out from the green moss, and secretly wonder how in the world you caught that big one in this warm weather. So let me tell you.

There are certain canons of fishing which it is well to enumerate by way of getting together. First, what a man brings home in his heart after fishing is of more account than what he brings in his basket. Second, it is no fun to catch fish after you have enough for the table. To catch them and let them go savors a little of taking a ball and going out to play barn-tick with yourself, to say nothing of a suggestion of cruelty. Third, it is far more fun to fish when they are shy and hard to get than to whip a pool where they rise by twos and threes and keep you busy. Fourth, it is more fun to locate one big trout, study him, tempt him, get him, than to fill your basket with little fellows that tumble up at the first invitation. And fifth, when you are hungry and need fish, then any honest method which puts a big trout in your fry-pan, and keeps you sniffing around the fire where Muctum is slow about supper, is good fishing.

I remember once when Phil and I were alone on a salmon river, deep in the wilderness. The water was low and clear, and, tho there were plenty of salmon, they simply would not rise. We had whipped every pool in vain at all hours, and we were pulling our belts tighter and tighter after two weeks' feeding on pork and huckleberries. Then I

THE FISHERMAN.

From a Painting for THE INDEPENDENT, by E. W. Deming.

took Phil's collecting gun, and went out and sat on a rock in the pool. After three hours a big salmon jumped in the air, and that night we ate him. Never a fish tasted better or left more happy memories. I smile yet, after twenty years, every time I think of him.

"But," says the disgusted angler, "you don't know anything about fly fishing: the delicate tackle, the cast light as a snowflake, the rise, the strike, the whirr of the reel, the play, the struggle, the—the—the everlasting *sport* of the thing!"

Surely I do, after trying it on a hundred streams from Labrador to Long Island. When trout will rise it is the keenest of sport; no one would try or want anything better. Moreover, you can catch more with the fly than with bait, if that is any object. But when they will not rise, when they are deep in the lake, no one knows where, and refuse fly and trolling-spoon and worms and minnows and cut bait—then you get down to the real art of fishing. You must find your fish where he hides, and then you must find something that will make him eat when he is not hungry; and you will not learn either of these things by instruction. I have taken a man who never had a fly-rod in his hand; in two hours I have taught him how to make a decent cast; and I have seen that man catch more and bigger fish than an old fly-fisherman, and in the same pools. But it takes at least ten years, and Job's patience, to learn still-fishing; and then you are just at the beginning of the art.

First, as to finding the fish. A trout or salmon likes water that is a trifle (one or two degrees) warmer than his cold blood. That is why he rises to the surface in spring, and why he disappears in summer. Sometimes he goes to the depths; more often, since he likes "living" water, he finds where a spring bubbles up from the bottom and loafs there all day long, only moving out to feed at twilight; so that your canoe often glides over a score of good fish that give absolutely no indication of their presence. For, curiously enough, they never break water at such places.

I remember a little lake—Dacy Pond, in the Sourdnahunk Valley—where there is a famous place. There are plenty of trout in the lake, clean, silvery, beautiful fish, but unusually notional. For days at a time they will sulk, refusing everything you offer. Then for an hour they will tumble up at anything, and stop as suddenly as they began. I asked a guide, who had spent twenty years about the lake, if there were any springs or deep holes, where we could be reasonably sure of getting a fish for our fry-pan, and he said no. "When they bite they bite; and when they don't you eat pork solitary. It's no possible use fishing," he assured me. One day, when I had been drifting for hours over the lake, watching the bottom, some shadows caught my eye for an instant and vanished. I let the canoe drift a while, paddled round the spot in a big circle, and drifted slowly over it again. There was no mistake; the bottom was covered with big trout. After half an hour I dropped a fly in there, lightly, from a distance; but there was no response. Then I went ashore, found some grubs, attached one to a fine leader, put him on a chip for a raft, and let him drift slowly, naturally, over the place, with ten times the art it had taken to cast a fly. When he was just right, there was the faintest possible movement of the tip, the raft stopped, the grub tumbled in, and in an instant I was fast to a big one. In half an hour I had all I wanted — fine, vigorous, hard-fleshed trout, from one to three pounds weight. They came out of a huge spring boiling up through a split rock, in the most unlikely spot, near some lily pads. You could go there at any time—except twilight, when they scattered—and, if it was too bright for a fly, let a grub or worm drift into the place, and be sure of an excellent supper.

There are just such spots in nearly every lake, and it is the first part of the still-fisherman's art to find them. Sometimes, instead of a spring, they choose a spot on the bottom in deep water; and here they are as notional as a fox looking for a place to sleep. In one spot, only a few rods square, there will be a score of large trout and salmon, while twenty feet away you may fish all day and catch nothing but cusk and eels. As they are fifty feet under water where you cannot possibly see them, and as you are out on the open lake, it requires no small patience to find them, and no small skill

to locate the spot by exact ranges, so that you can come quickly again and drop your frog or minnow or grub or worm exactly where you know it will be most appreciated. Watching a still-fisherman at play, you think, "Oh, what a chump, sitting there in the sun waiting for a bite!" But the still-fisherman is glad enough in his heart. He is watching the lake, the woods, the lights and shadows, the fishhawk wheeling, the deer and her fawns on the shore, the clouds drifting over the mountain. Far down under the delicate tip of his rod there is a minnow quivering about in the changing currents, and just six feet under the minnow two or three pairs of eyes are watching it. No hurry, no worry. It is not in trout nature to watch a tidbit like that many hours without rising to sample it. Then the still-fisherman will get busy. When he comes into camp he will have one trout or salmon that will make the dozen you caught with the fly look like smelts and chub bait. He will have seen more, thought more, enjoyed more, than you, with your ceaseless changing of flies and floundering; and you may even confess that the art which located and enticed and caught that one huge fish, and was satisfied, is, on the whole, worthy to stand with your own.

Among many such happy spots that I have found and fished on wilderness lakes—when trout would not rise to the fly, or when I had enough of fly fishing for the little fellows—there is one fountain of youth which makes me happy every time I think about it. It is on a large lake among the mountains, a beautiful place, where it was joy just to sit in your canoe, and lose yourself in the peace and silence and harmony of the world. Moreover, it was good fishing. The guides all said that it was useless to try the lake in midsummer; but I had heard all that before. One day, in sounding over the lake, I found a spot where a shoal ended in a ledge, which dropped sheer from twenty to forty-two feet of water. Then there was a shelf, some ten feet wide, and beyond that a drop into sixty feet. The shelf was hardly a dozen yards long, and hard enough to locate with your canoe bobbing and the waves racing past your ranges; but when you did find it you camped right there, if you had wisdom and patience. The fish were under you, and it was simply a question of your own skill whether you ate a big one for your supper; tho you might fight all around the spot for days without a nibble. Indeed, I gave the ranges to a dozen different guides and sportsmen; but they all came back empty-handed. They did not know the virtue of an accurate sounding line, and that in summer it is more essential to know the bottom of the lake than the surface.

For some reason the big trout and salmon loved to lie on that shelf; they were fat and full of smelts, and had to be coaxed with every variety of dainty, so that often you had to wait for hours before they would rise to your repeated and changing invitations. But when you did get a rise out of one, he kept you guessing. With a five-ounce rod and delicate leader to take a large fish out of that deep, cold water, to keep him from tangling up in the anchor line for which he heads at the first rush, or from whipping your rod under the canoe and smashing it at the last, and all the while he is unseen but vigorous as a wild calf on a halter, to keep guessing by jumps whether he is lightly hooked or whether the leader will stand it another moment —that will go a long way toward satisfying even the man who regards sport as the number of anxious minutes a fish gives you before you get him. Once with a light fly-rod I struck an eight-pound salmon there, and after ten minutes' play reached the net for him. He went through it, and clear to the bottom, and then fifty feet farther away, the reel screaming like a lunatic behind him. Then, standing in the bobbing canoe with the handle of the landing net under my arm, I played him thru the bottom of the net for fifteen minutes more till he came quietly alongside. That was sport enough, from the man's viewpoint. I am not yet quite certain how the fish regarded it.

In finding the hiding places of these big fish it is useless to depend on whipping the whole lake with your flies. Once or twice in a long summer you may get a shock when a big fellow rolls up at your Silver Doctor from the shallows

near a cold brook, where he is hunting minnows in the late twilight; but your flies are useless by day, for these big trout never rise from deep water, and seldom from the springs near shore. A good way to find the springs is to drift about the lake on a clear day, watching the bottom. It is a pleasant task exploring this green strange underworld, and you will keep your eyes and heart open to what passes on the shore as you glide along. When you find a spring in this way you will generally find fish at the same instant. Therefore, your approach must be silent and slow; otherwise you will not see even the shadows of trout as they dart aside. When the water is deep you will, of course, use a thermometer. That will give you the exact temperature near bottom; and the difference of a degree or two spells trout or chub for supper.

Most important to the still-fisherman is to know the bottom of his lake. The big trout and salmon are not scattered around promiscuously, but gathered in groups here and there; and where they are you will find no other fish. Now and then they follow the shoals of smelt and minnows; but at such times you get one only by happy accident, and by a different kind of fishing. During a large part of the day, often for days at a time, they they lie still in one spot that suits their own notins. They like a clean bottom to rest on, sand or gravel with a fine black sediment over it, or, best of all, dead wood finely broken. The way to determine this is to have a heavy lead on your sounding line, with a hollow end filled with white soap or tallow. When this strikes it picks up a little of the bottom, and tells you at a glance what you want to know.

As for your sounding line, have that on a free-running multiplying reel. Have it marked accurately, not in feet, but in reaches; that is, the distance between your outspread hands, which is a trifle less than your own hight. Then when you have found the right depth and bottom and temperature there will be no guess work. Don't do as the guide tells you: "Put a sinker near your bait, let it touch bottom, and then haul it up a little." That is pure blundering, which never takes a shy fish. A light sinker—just enough to carry your line down, but not enough to keep it from swaying with the currents—is put at the end of your line, and below that is six or eight feet of fine leader. Taking your bait in one hand, measure out your line exactly in reaches, so that when you put your rod overboard you know that your bait is swaying five or six feet over the spot where your fish is lying. If it is too near him he will, if not hungry, move aside and ignore it. If it sways gently a few feet over his head, it seems to be a principle of trout psychology that after a certain time the bait gets on his nerves or his stomach, and he rises to take it in.

Once, as an experiment in a spring hole, I swung a bait over some big trout that I knew well were not hungry. They saw it plainly enough, for at first one or another would slant up, almost touch it with his nose, and roll lazily to the bottom again. Presently they ignored it altogether, and for five hours nothing happened. Then the largest trout rose swiftly and was away with the bait before I had time to lift the rod.

This may be exceptional; and it is certainly more fun to fish when you do not see your trout; but it explains the still-fisherman's faith and patience. It never troubles him that he does not get a bite. He knows just where his bait is, and that under it is probably a big fish waiting for the psychologic moment to make things interesting. So he never wearies, and after he has been waiting five or six hours without a bite and it is time to go home, he still lingers, gets everything ready before lifting his rod, and then winds up slowly so as to give the trout a last chance. A score of times at least I have struck a big fish, after waiting for hours, just as I was reeling in. And that is another curious bit of trout psychology; he ignores a bait as long as it is there; but often hurries after it the moment it is gone.

Meanwhile, as you wait, you have the very best part of still-fishing, not catching fish, but better things, sunshine and rain, light and shadows, clouds and mountains, lake and forest, birds and animals—catching a heart full of good things to send you home contented. Once I made friends with a wild gull, who was shy enough at first, but who grew friendly after I had sent numerous

little fish drifting down to the rock where she had her nest; so that at last she would rise when she saw my canoe and fly ahead of me to my favorite fishing ground. Again it was a fishhawk; and whenever, from fishing too deep or too near the surface, I had a fish that I did not want, it added to the weight of my own basket to see Ismaques plunge for it and bear it swiftly away to his hungry little ones. And besides these are the loon and the deer and the mink and the great eagle resting on the wind high over the mountains. Soon you return with a sense of joy to the same good spot day after day, perfectly sure that you will have good fishing. You sit in the bottom of your canoe leaning comfortably against an air cushion; the sunshine warms you, the winds fan your cheek, the birds call for your ear alone, and your light craft veers just enough to keep your bait moving, or goes *canoedling* over the waves just to make you sleepy. No worry about results. Far below you, out of sight, your minnow or grub is moving naturally, and below him the trout are watching. They will take care of your fish-basket, while all nature fills your heart with light and melody and peace for you to take home with you. So that, while I have seen a hundred fly fishermen give up, growing impatient or dissatisfied after an hour's steady casting with no results, I have never yet seen a real still-fisherman who wanted to stop, or who was not content with what he was catching.

Lazy? Of course. But why in the world should a man leave his bench and travel a hundred miles into the wilderness for the sake of finding more work?

STAMFORD, CONN.

The Credible and the Incredible in Natural History

BY JOHN BURROUGHS

I ALWAYS suspect the truth of the statements of our new school of nature-writers when they make their birds and beasts do things in the human way or act like rational beings. Does the robin or the bluebird, that dashes itself hour after hour and day after day against a window pane, under the delusion that it is demolishing a rival in its own reflected image and that keeps up the assault until it is quite exhausted, act like a rational being?

At Bahia Blanca, in South America, Darwin saw a bird, the casarita, that builds its nest in holes which it drills in the banks of streams like our kingfisher. At one place where he was stopping the walls around the house were built of hardened mud, and were bored thru and thru with holes by these birds in their attempts to form their nests. The mud wall attracted them as if it had been a natural earth bank, and in trying to reach the proper depth for their nests, six feet or more, they invariably came thru and out on the other side. Still they kept drilling. Says Darwin:

"I do not doubt that each bird, as often as it came to daylight on the opposite side, was greatly surprised at the marvelous fact."

Both these cases are typical of the wit of birds, or rather the want of wit, when they confront new conditions, or when the works of man come in the way of their instincts.

System, method, organization characterize the ways of man — right lines, measure, proportion, etc.; but the works of the lower animals are for the most part like natural growths or accumulations—haphazard, hit and miss, blind, tangled, irregular. They adapt means to an end, but they do not do it as man does; they do it more as children do, crudely and unsystematically. The dam of the beaver looks more like a stoppage

of the stream by soil and driftwood brought down by a flood than like an artificial structure. The oriole uses strings in building her nest when she can get them; this is a wise use of means to a given end, viz., a pendant nest, but how blindly, awkwardly, confusedly she uses these strings while she yet makes them serve her purpose. Before me as I write is an oriole's nest in which strings play an important part; two sides of the nest are attached to twigs by strings and horsehairs wound round and round as the winds might have wound them; the other side is held by two strings attached to twigs eight or nine inches above, again suggesting the work of the wind, or the workings of some blind, instinctive force that knew what it wanted, but had no system or method. The strings are not tied to the twigs, but wrapped around them and held in place by a confused mass of fine, flax-like shreds and fibers. The other ends are wrought into the body of the nest and disappear in the same confused mass of fine fibers and horsehairs—the whole structure a complete success from the bird's point of view and a fine sample of the workings of instinct, but entirely void of the method and plan that mark man's handiwork. It is more like a natural than an artificial product. The bird employed mechanical devices without mechanical ideas; she wove a fabric and attached it to the limbs of a tree as the winds might have done it, had the winds the instinct of nest building. What I mean is that while the nest shows the blind intelligence of nature, it gives no sign of the rational intelligence of man.

Hence when one of our popular nature-writers, some years ago, described an oriole's nest fastened to a framework of three sticks picked off the ground and joined together so as to form a triangle, then suspended by three strings with carefully tied knots to one larger string, which was skillfully tied to the branch of a tree, the whole making a device that had the measure and precision of a hammock or a hanging basket, why, his most credulous reader could not help feeling he was being imposed upon. The thing was impossible for any bird. It was done in the human way—not in wild nature's way. Only the hands and mind of man do such things.

On similar grounds how is one to credit the story of another one of our nature-writers who tells us that one day in the woods he saw a ruffed grouse running toward him as if for protection. She was pursued by crows, and he discovered that she had one of her own eggs under one of her wings. She had saved this egg from the robbers and was in sore need of help. Very pretty and very human, but how is one to believe it? The same writer affirms, as others have affirmed before him, that crows have courts of justice and try their criminals by a jury of their peers, and punish them with death or expulsion from the tribe when found guilty.

JOHN BURROUGHS.

Such human proceedings among the wild creatures are very pretty, and I fancy are much relished by the credu-

lous public, but in the mouths of real woodsmen they leave a bad taste.

We have at least three recent nature-writers who romance in this way about the wild life of our fields and woods, but

AT SLABSIDES.
Mr. Burroughs of the Cabbage Patch.

who all resent indignantly any question of the literal truth of their statements. They seem to think that the old writers are slow and dull, and that the reading public demands something more advanced, more in keeping with the wonderful and progressive age in which we live, so they report startling and marvelous things, where our veteran naturalists saw only plain facts. No sooner does one of these observers step out of doors than the wild creatures proceed to get up private theatricals for his especial benefit. Something novel and surprising happens at every turn. Events are suddenly crowded together. The stage is thronged with actors; bird and bug and four-footed beast come rushing in and play their rôles like veteran actors. One of these men sees more new and curious things on a casual summer day's walk afield or in the woods than Thoreau or Audubon or Jefferies or Gilbert White saw in a whole lifetime. It is not merely in inference and description that these modern writers give free rein to their fancies; it is in their record of things seen. It is a kind of intensive observation, I suppose, like our modern intensive farming—three or four crops taken from the same soil the same season, or maybe all growing at once on the same soil. But the principal part of the crop is tares.

The wild life about us does not keep pace with the telephone or with telegraphy. For all the schools and kindergartens of the woods, the wits of bird and beast do not improve. The ways of human beings are as foreign to them as they ever were. There is no more division of labor among them than there was a century ago, and they have no more system or method in their procedures. The crow is no more a collector of curios

now than he was in the time of Audubon, and the ground-nesters among the birds still play the old confidence games to entice the intruder away from their nests that they practiced upon our pioneer observers. The wild creatures are getting more familiar with man and are fitting their life problems into his with some success, but they are still in the main guided by instinct, and not by reason. The phœbe bird has learned to seek the protection of sheds and porches for her nest, but she still sticks to her green moss, which concealed her nest under the mossy ledge, but which betrays it on hewn timbers. The swallows nest about and in our habitations because mud for nests and insects for food are easier found there, and because our barns are a safer place for them than the cliffs and trees, but how else have they changed? When the swift deserted the hollow trees for our chimneys she brought her dry twigs for her nest from the woods with her. There are now more chimneys than hollow trees and they are probably a bit safer. The woodchuck eats our beans and clover where he used to live on the wild herbage of the woods, but is he a bit more human?

Gilbert White is still the model natural-history observer and recorder, uniting a keen love of the truth with a love of all forms of life and with a scholar's dignity and purity of style. Our modern nature-writing in the same field is good and worthy of preservation only so far as it is like his in certain indispensable qualities. Thru the genius of Darwin and others we have light upon subjects that were obscure to Gilbert White, but his methods, his spirit, his truthfulness, his style, are still worthy of our emulation.

A man who has neither the gift of observation nor the gift of style has little call to write upon nature, or upon much else for that matter. The style will enable him to give the feeling and spirit of nature, which is undoubtedly the better part, and when wedded to the power of observation we get the facts, too; we have a Thoreau or a Gilbert White—men vastly different, it is true, both in their method and aims, but both genuine of their kind. White blends the scholarly, literary and scientific spirits, while Thoreau adds to these the religious and transcendental spirit with less of the enthusiasm of the pure scientist. Thoreau goes to nature for much more than the mere fact; he is seeking a balm for his spirit and for some tidings of the elusive hound and horse and turtle dove that he lost so long ago. Our new school of natural-history writers defend themselves by saying: "We, too, go to nature for something more than the mere fact," and then proceed to give us fiction, as if an untruth were not something infinitely less than a fact. Read into the fact all the meaning you please, make it the key to the Sphinx's riddle, if you can, but see to it that it is a fact, or the Sphinx has already fixed her clutch upon you.

"Facts, facts!" I fancy these new nature-writers replying: "You are always harping upon facts, as if there was not something vastly more precious than facts, namely, the truth!" Yes, the truth is better, because larger and more liberating; but there must be many collections of facts before Darwin can give us the truth of natural selection and the origin of the species. The house of truth is what we finally live in, but the stones of which it is built are all facts.

West Park, N. Y.

Motoring Routes to the Jamestown Exposition

BY R. H. JOHNSTON

Member of the Touring Committee of the American Automobile Association.

ALMOST every one who possesses an automobile—or who has an intimate friend who owns one—has given some thought to the possibility of visiting the Exposition in a motor car. Naturally, the first question which presents itself is regarding the routes. A year ago Norfolk had no place on the motoring map, but the opening of the Exposition was the signal for considerable exploring work to be done on the routes leading there from other sections of the country.

As the vicinity of Norfolk is bounded on the east by the Atlantic Ocean, on the south by the Dismal Swamp and on the north by the James River and Hampton Roads, it is evident that the only all-land approach is from the west. Therefore, the uncompromising motorist, determined to drive every foot of the way from his home to the gates of the Exposition, has little choice of routes. But if the tourist from the Northern States is satisfied to do part of his traveling in his car and to make the last stage of the journey to Norfolk by boat, he has considerable latitude in arranging his itinerary.

Hagerstown, Md., is the point of convergence of a number of important routes leading to Norfolk, and, therefore, "How to get to Hagerstown" becomes a question of vital interest. Tourists from New England, New Jersey and the eastern part of New York State should proceed to Philadelphia by the usual touring routes and should then turn westward toward Gettysburg. From Philadelphia there are two distinct routes to Gettysburg, one by way of Lancaster and York and the other by way of Reading and Harrisburg. The former is the more popular, as the distance is but 120 miles, some 30 miles shorter than the route by way of Reading and Harrisburg. Both of these routes lie for the most part over toll-roads, which are kept in very good condition, as, indeed, should be the case, since the toll averages about three cents per mile.

A visit to the battlefield of Gettysburg is well worth many days of traveling. The battlefield is now a national park, and the Government has built a network of fine macadam roads which reach every part of this historic spot. There is no other locality in the country that has so many fine monuments. Your guide will tell you that there are no less than 467.

The scenic features of the trip may be said to commence at Gettysburg. Whether the tourist travels due west to Chambersburg and then turns south to Hagerstown, or takes the more direct, tho more difficult, route to that town by way of Waynesboro, he will have several ridges of mountains to cross, from the summit of each of which the view is indescribably grand. Those motorists whose touring has been confined to the less rugged sections of New York and

New England will be charmed by the delights of traveling over the mountains.

But to the tourist who approaches Gettysburg from the west, mountain scenery will have ceased to be a novelty. There will doubtless be many enterprising tourists who will drive to Jamestown from as far West as Chicago. Their route will lie by way of Valparaiso and South Bend, then thru Toledo and to Cleveland, following quite closely the Lake Shore Railroad. This part of their journey will be thru a comparatively flat and rather monotonous country.

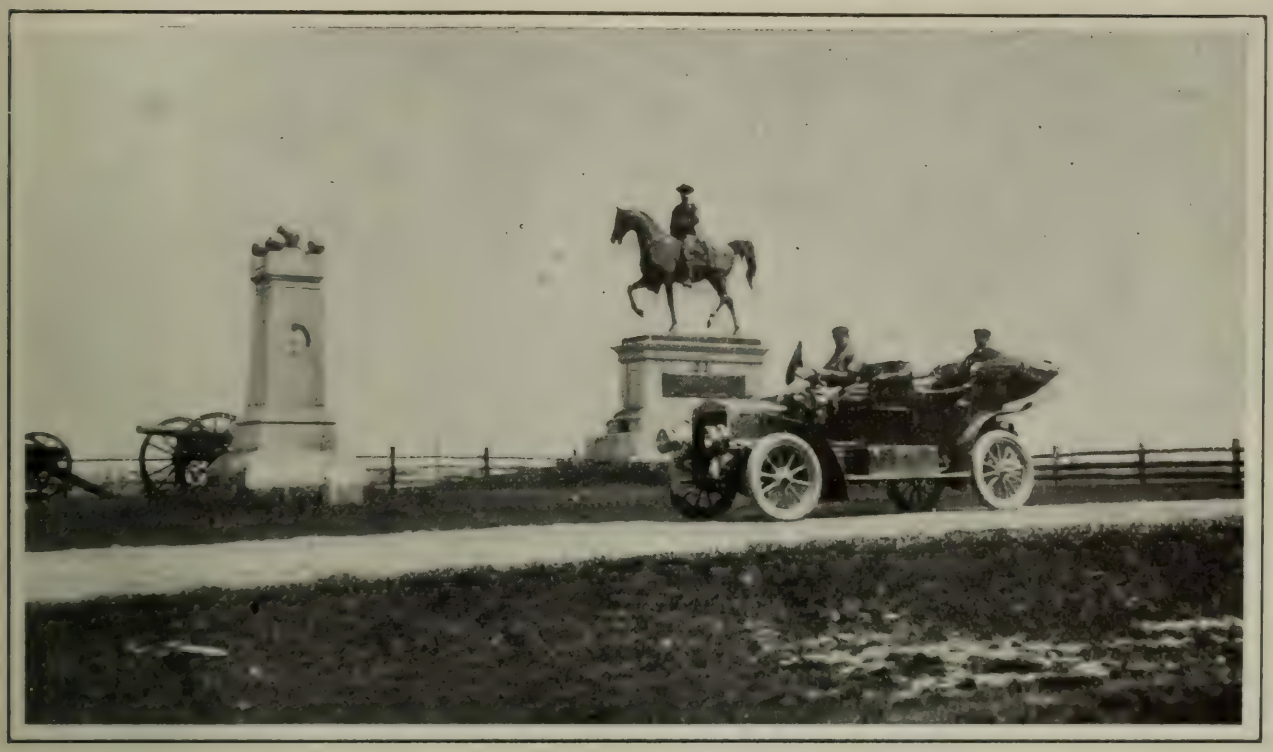
From Cleveland the Jamestown tourists will proceed southward thru Warren, Youngstown, Beaver Falls and Sewickley to Pittsburg. Up to this point the tourists will have had comparatively easy going, but when they reach Pittsburg and turn eastward, the character of the going will change abruptly. The Alleghany Mountains, with their three main ridges and innumerable minor ridges, will lie before them, and abundant opportunities will be given for testing the hill-climbing qualities of their cars. Of the several routes between Pittsburg and Bedford, that which is generally favored by tourists passes thru Greensburg, Armagh and Johnstown. From Bedford there is but one touring route to Gettysburg, which leads thru a mountainous country by way of Everett, McConnellsburg and Chambersburg. After looking over the battlefield of Gettysburg, tourists will proceed to Hagerstown by one of the routes already described, and from here their final dash to Norfolk will commence.

Hardly will the tourists have left Hagerstown than they will be reminded that they are traveling thru a section rendered famous by some of the bloodiest engagements of the Civil War. Scarce an hour's ride out of Hagerstown, they will cross the battlefield of Antietam and will pass within a stone's throw of a number of fine monuments. Just beyond is Sharpsburg, the chief industry of which is the sale of souvenirs of the war. [I had almost written "manufacture and sale."] Below Sharpsburg, the motor-

MAP OF ROUTES TO JAMESTOWN.

ists will "cross the Potomac," passing from Maryland into the State of West Virginia. Next comes Charlestown, where John Brown was tried and hanged in 1859 after his ill-starred attempt to free the slaves.

All the way from Hagerstown, the traveling has been over a perfect macadam toll road, and almost before the tourist realizes it he will be at the famous town of Winchester ("20 miles away"), where the Shenandoah Valley commences.



The Valley is unusually favored, as regards soil and climate, and few agricultural regions show signs of such all-pervading prosperity. The Shenandoah Valley Pike, terminating at Staunton, 93 miles south of Winchester, is as fine a stretch of toll-road as the most exacting tourist could ask for. At Staunton the tourist will turn east and proceed over rather indifferent roads to Charlottesville, and then to Richmond. Here a few hours should be spent in seeing the sights of the old Confederate capital. The final stage of the journey will be thru a sandy and rather marshy country, thru Wakefield and Suffolk to Norfolk. The Jamestown Exposition is situated about 10 miles from the city, the connecting link being a highway, of which the less said the better.

The tourists who reach Norfolk by the route described above will find at Norfolk many of their fellows who have come by a much shorter and considerably less interesting route. There is a route from Philadelphia of less than half the mileage of that above described, altho the last 36 miles are made by boat. This short route leads from Philadelphia almost due south thru Delaware and the "eastern shore counties" of Maryland and Virginia to Cape Charles, passing thru Wilmington, Dover, Salisbury, Pocomoke City and Eastville. From Cape Charles it is but a three hours' ride on a fast mail-boat to Norfolk.

THE OLD AND THE NEW.

It might be thought that the tourists from Baltimore and Washington could simply proceed south thru Fredericksburg to Richmond, when they would have a journey of but 120 miles to Norfolk. The road thru Fredericksburg, however, is practically impassable, and no one should attempt it, unless he has plenty of time on his hands and takes pleasure in surmounting unusual road obstacles. The tourist from Washington will do better to proceed due north to Ellicott City, where he will be joined by the tourists who have started from Baltimore. At Ellicott City commences the old National Highway, which was completed almost exactly 100 years ago.

THE BATTLEFIELD OF GETTYSBURG.

This is a fine, wide road, which is kept in good condition by the toll company into whose hands it has now fallen. Thirty-five miles west of Ellicott City, the National Highway passes thru Frederick, immortalized by Whittier in his poem, "Barbara Freitchie." The tourists will leave the National Highway at Frederick and proceed by way of Knoxville to Harper's Ferry. Four miles beyond Harper's Ferry, at Halltown, is the main route connecting

HARPER'S FERRY.

Hagerstown with the Shenandoah Valley.

But one other important touring route remains to be considered. The tourist may go from Pittsburg to Hagerstown by a route other than that already outlined. From Pittsburg, there is a route leading almost due south thru Uniontown and Somerfield to Cumberland, Md. Here the tourist will strike the National Highway, which leads direct to Hagerstown.

If the tourist from the West wishes to reduce the time spent on the road, he may continue on the National Highway to Ellicott City and then go to Baltimore, where he may take the boat to Norfolk. Or, he may turn south at Ellicott City and proceed to Washington and there board the boat. It is possible, also, that tourists starting from Philadelphia and points north of that city, instead of going west to Gettysburg or due south over the sandy roads of the Delaware peninsula, may desire to save time by driving direct to Baltimore or Washington and thence to Norfolk by boat.

With these possible variations in making the journey, it is probable that most tourists will go to Norfolk by one route and return by another, thus seeing as much new country as possible. Whatever route they may follow, they will find that good roads predominate, altho they must expect occasional stretches of bad going. Tourists will be able to live comfortably along the line, as the hotels, particularly in the larger cities, are fairly up-to-date. It is possible to purchase gasoline almost anywhere. In each little town there is sufficient demand for this commodity, for the local druggist or hardware dealer to carry a limited supply. Toll-roads prevail in Pennsylvania, in Maryland, in West Virginia and in Virginia. The rate for a touring car, carrying four or five passengers, varies from two cents to five cents a mile, the latter figure being exceptional. It is necessary to procure separate licenses in each State, except in Delaware, where non-residents may remain forty-eight hours without undergoing any license formalities. Licenses may be obtained in each State by making application to the Secretary of State.

New York City.

TOLL-GATE ON THE PENNSYLVANIA PIKE.

Literature

Outdoor Books

THERE are books in abundance now on all subjects, even—or, rather, especially—on how to get away from books. We follow the leadings of our literature into the forest. All vacation tastes can be suited. There are books for the strenuous who delight in hunting bear and elk in mountain wilds, for the sluggard who spends his time in the consideration of the ways of ants, or should, and even for that still more inert individual who would not roll over in his hammock to ascertain the generic name of the bird whose song disturbs his repose. For the first class we have upon our table a little volume[1] of President Roosevelt's experiences in the West, originally contributed to *Harper's Round Table* ten years ago. They are intended for the reading of boys and are full of wholesome advice on hunting and ranching. Mr. W. S. Thomas is an advocate of the use of the camera instead of the gun in *Hunting Big Game*,[2] but he seems to be more skilful in handling the latter than the former. He was fairly successful in shooting moose and bighorn, but his photographs of wild animals are not so good as they ought to be from his opportunities. His camera was apparently unsuited to the work. In comparison with the recent achievements of Schillings and Hornaday and others in this field they make a very poor showing.

Bird photography, altho not so dangerous and difficult as the snapshotting of big game, nevertheless demands in the sportsman the highest degree of patience, perseverance and ingenuity. We have of late had several beautifully illustrated books in this line, and Mrs. Stratton-Porter's new volume[3] is worthy to stand beside any of them. The author has made friends of the birds, feeding the nestlings and coaxing the old, until their fear disappeared, and they revealed their home life as frankly as the tenement house is opened to the sympathetic district visitor. The author conducts a campaign with a battery of four cameras and a wagon load of field paraphernalia, and is indefatigable in working for a favorable position, light and posing of her wary subjects. She is decidedly opposed to the common practice of transferring the nests to an outdoor studio, with an artificial background. Besides the numerous half-tones, the volume contains seventeen full-page colored plates of unusual accuracy and beauty.

After being introduced to the birds by such a book as the above, one naturally will want to make their closer acquaintance, and in this Mrs. Wright's *Birdcraft*[4] will be useful. The seventh edition of this popular work is now out. It contains in its 300 pages brief and very compact descriptions of 200 American birds, giving scientific and common names, size and markings of male and female, song, season, breeding time, nest, eggs and range of each, with numerous illustrations and a key for identification.

The ornithological tourist to California should provide himself with Keeler's *Bird Notes Afield*,[5] because he will find on the Pacific Coast many unfamiliar species and variants for which his Eastern handbooks will often fail him. The author has solved the problem of how to get in the necessary technical information without making the book unreadable by dividing the volume into two parts, in the first half describing the life and habits of the birds, with especially attention to their songs, and in the appendix giving a full descriptive list with a key for classification. The book is bound in canvas stamped with brown and is illustrated by photography.

Those who are interested in insect life, and still more those who are not, ought to read Dr. McCook's *Nature's Craftsmen*.[6] Probably our readers will remember these well-written stories of ants, bees and spiders as they appeared in

A ROW OF YOUNG CHICKADEES.
From Keller's "Bird Notes Afield."

Harper's Magazine. It is an admirable volume for the open shelves of the public or school library. He is a queer person who would not be attracted by these drawings of curious examples of insect architecture and led to read the strange life history of their builders and inhabitants. The reverend entomologist tells of the cicada, that spends seventeen years below ground in preparation for six weeks on the wing; of the agricultural ant of Texas, that cultivates and harvests grain; of the communistic ants and their gigantic phalansteries; of the spiders that construct balloons to travel in, and of the caddis worms and their cairns. He does not fall into the common error of endowing them with human or superhuman psychology, but keeps to his observations and a rational interpretation of them. The book is unusual in being really illustrated, not merely adorned with pictures.

Grasshopper Land[7] is a book of somewhat similar aim, but narrower in scope and not so well written or illustrated, intended, directly or by proxy, for younger readers. It differs from most nature-study books in including the history of its subject. The author has been assiduous in collecting references to crickets and locusts in ancient and modern literature. This information will be convenient for teachers by giving them something more to talk about.

Teachers also may find their faith in outdoor education strengthened by a perusal of *The Spirit of Nature Study,*[8] tho we question whether it was really worth putting into book form these desultory suggestions. They are sensible enough and their light personal style would make them effective as informal talks at a teachers' institute, but they cannot be regarded as permanent contributions to the overabundant literature of the subject. Still more fragmentary, but showing much greater literary skill, are the *Nature Notes*[9] of Madison Cawein. These are fugitive impressions and descriptions, *remarques* such as artists put on the margins of their pictures, daintily done and evincing close observation and love of nature for its own sake. Dr. Gray could keep his mind longer on one subject than Mr. Cawein, and his *Musings,*[10] tho not pietistic, are infused with the Christian spirit. The selection of these impressions of outdoor life was the last work of the late editor of *The Interior,* and the little volume is illustrated with his own photographs. Mr. Ernest McGaffey is a true follower of Izaak Walton, able to use both hook and pen effectively. *Outdoors*[11] is evidence of his skill with both implements, for we always take a fisherman's word for his own exploits, and the style of the book vouches for itself. But he is, besides, fond of shooting loons, plovers and prairie chickens, as well as hunting

foxes, woodchucks and squirrels, about all of which sports he gives much good advice. Dr. John Madden's account of his *Forest Friends*[12] is dedicated to his son and will be read with profit by many other men's sons. The author grew up in close communion with birds and beasts in the woods about his pioneer home on the shore of Lake Michigan, and he tells of their lives and habits without exaggeration or fantastic embellishment.

For European Travelers

THE number of color pictures we meet with in books of travel and description is certainly an evidence of the increasing popularity of this form of illustration

THE BLUE HERON.
From Stratton Porter's "What I Have Done With Birds."

We confess we do not find these showy sketches, especially when they are of still life, always satisfactory, and have a mild partiality in favor of plain black and white. The colors are often laid on too thick and the exaggeration is palpable. On the other hand, imagination, legend, history, art and style are becoming more and more the prominent characteristics of such volumes, and the reader has grown more and more exacting in consequence, requiring beauty of expression and truth of sentiment as well as accuracy of details. The thirty-two full-page color illustrations in Mr. Mathew's work on Ireland[1] are, at first sight, delightful. They are splendid, and then one begins to ask: Are they not too splendid? Have ever such pronounced reds and browns and yellows been seen in Ireland or anywhere else? Where the artist has shown self-restraint, however, the effect is charming, as in "The River Lee" and "The Cross of St. Columkille at Kells." Mr. Mathew exhibits a very strong feeling for the picturesque and a very ardent desire to be exact, complete and impartial. On the political and social state of contemporary Ireland, its material decay and its chances of recovery he furnishes a number of facts drawn from the best sources and skilfully presented.

But of all the guide books—we hope we are not disrespectful in calling it a guide book—we have seen of Ireland or of any other country, Mr. Gwynn's[2] is about the most instructive and entertaining. If the scenery he so vividly and fascinatingly describes were in the Balkans or in Timbuctoo, we should see crowds hastening to enjoy its beauties. Even tho it is only in Ireland and at our doors, we do not for a moment doubt that this work will have an effect on tourist travel during the season. Mr. Gwynn avoids the beaten paths; we have

[12] FOREST FRIENDS. The woodland adventures of a boy pioneer. *By John Madden.* Chicago: A. C. McClurg & Co. $1.25.

[1] IRELAND. Painted by *Francis S. Walker*, described by *Frank Mathew.* New York: The Macmillan Co. $2.00.

[2] THE FAIR HILLS OF IRELAND. *By Stephen Gwynn* with illustrations by *Hugh Thomson.* New York: The Macmillan Co. $2.00.

nothing about Killarney and the Giants' Causeway. But we have graphic pictures of places rivaling them in interest of which no one outside Ireland has ever heard. The Rock of Cashel, with its buildings more than a thousand years old, and its site in the most fertile part of the Golden Vale—a site considered by many more impressive than that of the Acropolis of Athens, is described with great minuteness and charm. Apart from scenic description, the book presents a continuous view of Irish history from the earliest times, especially of the period when Ireland produced its most characteristic work in literature and art, beginning in the fifth century. How he has managed to pack, in a volume of a little over 400 pages, so many delightfully told legends and historic incidents, which give to every landscape a sort of moral personality, is Mr. Gwynn's secret. To the angler the book should be invaluable, for Mr. Gwynn is an enthusiastic sportsman, and apparently knows every trout and salmon stream in the kingdom. The illustrations are wonderfully soft and delicate; even those in color are an enchantment to the eye, for they are sober and sincere.

The *Paris*[3] of Mortimer and Dorothy Menpes may not have much of that practical quality of serviceableness which we look for in a guide, but it has a brilliant and personal style and will supplement in a very pleasant fashion a work more purely utilitarian. It will be found especially delightful by those who wish to travel without moving from their own comfortable easy chairs. The authors have very little to say on the churches, art galleries, museums and other subjects concerning which the untraveled rover needs information. But of the life of Paris, and, above all, the joy of life of Paris, he will get some fascinating glimpses, related in a vivid and impressionistic style. The streets and boulevards, the cafés and restaurants, the various forms of amusement, the poverty and picturesqueness of the shiftless and generous students of the Latin Quarter,

AGRICULTURAL ANTS HARVESTING BUFFALO-GRASS.

[3] PARIS. *By Mortimer Menpes.* Text by *Dorothy Menpes.* New York: The Macmillan Co. $2.00.

and many other phases of Parisian existence, are rendered in all their lights and shades with astonishing accuracy. The authors seem to have got at the very heart of the *Ville Lumière*, and so have been able to present her in all her versatile attractiveness. The illustrations in color, as well as those in line, are smooth and harmonious. The former are not glaring, but faithful and delicate, with subtle gradations of tone that are very striking. For practical utility the unpretentious little book[4] of Mrs. Williams is in every way excellent. It is intended for women. It gives the addresses of suitable hotels, boarding-houses, shops, schools of art, teachers, places of amusements; treats of fees to servants, prices generally and supplies—just the sort of information needed by American ladies in Paris. And, altho written for women, we fancy that men will find it almost as valuable.

The *Book of the Pyrenees*[5] is not so much a guide as an introduction to these mountains. It is, however, replete with information not of a merely geological or geographical character. There are interesting historical sketches of the different provinces and districts the author has visited. Mr. Baring-Gould's work leaves the impression that the mountain scenery of the Pyrenees is superior to that of the Alps and of the Tyrol, and has the additional advantage of not being yet overrun with the Cook excursionists. The local color is richer and more varied, and the peasantry, unlike the Swiss, have not lost their antique simplicity. He shows that the Eastern Pyrenees, especially, have been unduly neglected, altho within easy reach of the tourist. The illustrations, all in black and white, are very numerous, and are noteworthy for the softness and mellowness of the tones. Mr. Seymour takes us across the Pyrenees, but confines his *Saunterings*[6] to those cities in which the Moors had founded their greatest seats. Most writers who have written about Spain wrote as if they loved it passionately or hated it passionately. Mr. Seymour belongs to neither class, and that may be one of the reasons why his narrative arouses only a rather languid interest. But another reason is that his style lacks distinction; is, in fact, somewhat crude. The most readable chapters are those on Madrid, altho why Madrid should have been placed among the Moorish cities of Spain is puzzling. A good many guide books speak of the Spanish capital disparagingly. Mr. Seymour ranks it among the most agreeable capitals of the world—a second Paris, indeed. His account of the pictures in the Muséo del Prado is also interesting. The illustrations are so fine that they almost make up for the shortcomings of the text; some of the reproductions of Velasquez and Murillo are exquisitely beautiful.

Since the walls of the Alps have been pierced by three great railroads, and especially by the Simplon route, and thus brought into communication with northern lands, a good many Americans entering Italy from France or Switzerland, like to break their journey to Rome or Florence and visit the beautiful lakes that lie hushed in the shadows of the sub-Alpine mountains. Mr. McCracken[7] will be found to be an excellent cicerone by those who have such a visit in contemplation. He is enthusiastic and sympathetic, and every lake and island has for him its own special charm, its own distinctive beauties and its own historical or artistic associations. The picturesque towns and villa gardens on the shores are vividly described, and not only those which are famous the world over, but many which have succeeded in shyly hiding their loveliness from all eyes but those of the author, who has done his work with conscientious thoroness. The last chapters deal with people who had more or less connection with the towns on the lakes. They are interesting enough, altho, perhaps, an unkindly critic might be tempted to regard an account of the plot of "I Promessi Sposi" and the introduction of Lady Mary Wortley Montagu's letters as something in the nature of "padding."

The three books before us on Rome deal severally with different aspects of the Eternal City, and are each admirable in its way. M. Rodocanachi,[8] who is an

authority on Rome, ancient and mediæval, has availed himself of all possible sources of information in his very comprehensive and complete monograph on the Capitol. It is, of course, scholarly and scientific—too much so, perhaps, for the traveler who has neither time nor inclination for a minute examination of the antiquities, buildings and ruins of the famous hill; for such as have, the volume cannot be excelled. For the tourist who wants to understand the historic significance of what he sees, the light and handy pocket volumes of Grant Allen's series of "Historical Guides" will be found very useful. There have been published previously "Paris," "Florence," "Venice," "Cities of Belgium," "Cities of Northern Italy," and now *Christian Rome*[9] has been added, especially valuable for the Vatican galleries. *Notable Pictures in Rome*[10] is not so convenient in shape and size, an important consideration to the sightseer. It weighs 20 ounces, to begin with, and would weigh 20 pounds by the end of the day. The heavy paper is used because of the numerous little illustrations, which are useful in identifying the pictures described and in recalling them to mind afterward.

THE BOATHOUSE.
From Gray's "Campfire Musings."

Mr. Jackson's work[11] deals with a part of Italy not much visited by American travelers, except for a few towns like Ravenna, Rimini and Brindisi, and deals with them chiefly from an architectural and archeological viewpoint. He sets forth his facts with order, method and lucidity. A good book; in fact, the only fault one is inclined to find with it is that it is too monotonously good. A little more liveliness would atone even for a lapse in grammar. It is also a very big book, quite too big to serve as a guide; a book not to be read thru, but to be dipped into with advantage by the tourist and studied by the specialist. It is thoroly illustrated with original sketches, plans and photographs.

Mr. Sladen has written *the* book for travelers in *Sicily*,[12] packed with history and good advice, arranged like a dictionary. It is an enchantment to go to the island with him, his study of the moods, sentiments and temperaments of its people is so subtle, sensitive and penetrating. His sympathy is really commun-

[9] CHRISTIAN ROME. *By J. W. and A. M. Cruickshank.* New York: A. Wessels Co. $1.25.

[10] NOTABLE PICTURES IN ROME. *By Edith Harwood.* New York: E. P. Dutton & Co. $1.50.

[11] THE SHORES OF THE ADRIATIC: THE ITALIAN SIDE. *By Hamilton Jackson.* New York: E. P. Dutton & Co. $6.00.

[12] SICILY. *By Douglas Sladen.* New York: E. P. Dutton & Co. $2.00.

icative and calculated to modify our somewhat dubious appreciation of our own Antonios and Giuseppes. Besides enabling us to enter into the intimacy of Sicilian life, he furnishes us with bright and vigorous descriptions of all that is most remarkable among the monuments, curiosities, products and resources of every kind of the country.

For those who are thinking of a summer scamper thru the European Continent, with a brief stay in England and Scotland, Mr. Cooke's little work[13] may be recommended. It is rather cleverly written and describes graphically most of the historic spots the class of tourists for whom it is intended will find time to visit.

We must include here mention of Mr. Loomis's little book of his experiences in England.[14] It is not a guide book, but is franker and funnier than most guide books, and will be appreciated by all who have been there.

The Travelers' Handbook[15] is not concerned with descriptions of sights and tours, but is full of practical advice as to the customs of the various countries, their coinage, tramways, railroad guides, fees, food, etc. Much of the information is intended for American women. They are even told where they can find their favorite breakfast foods and patent medicines. The following sentence shows how detailed are the directions as well as how peculiar is the English of the book:

"The writer prefers the horsecar, to get which one requires but to walk a few steps up the street to the iron post, which proclaims that here is the 'Tramweg' halting-place, and there wait until a car marked 'Park Hofplan, Beurse,' comes along, with the horse trotting away from the direction in which she first walked up the street."

Presumably the horse walks up hill and trots down.

If one is limited in time or money for his European trip, he will probably be able to save both by consulting Frazar's *Practical Guide*.[16] Here he will find a large number of tours, all, of course, on the beaten paths, worked out with full details as to routes, cost of tickets, time required, hotel references, what to take and what to see.

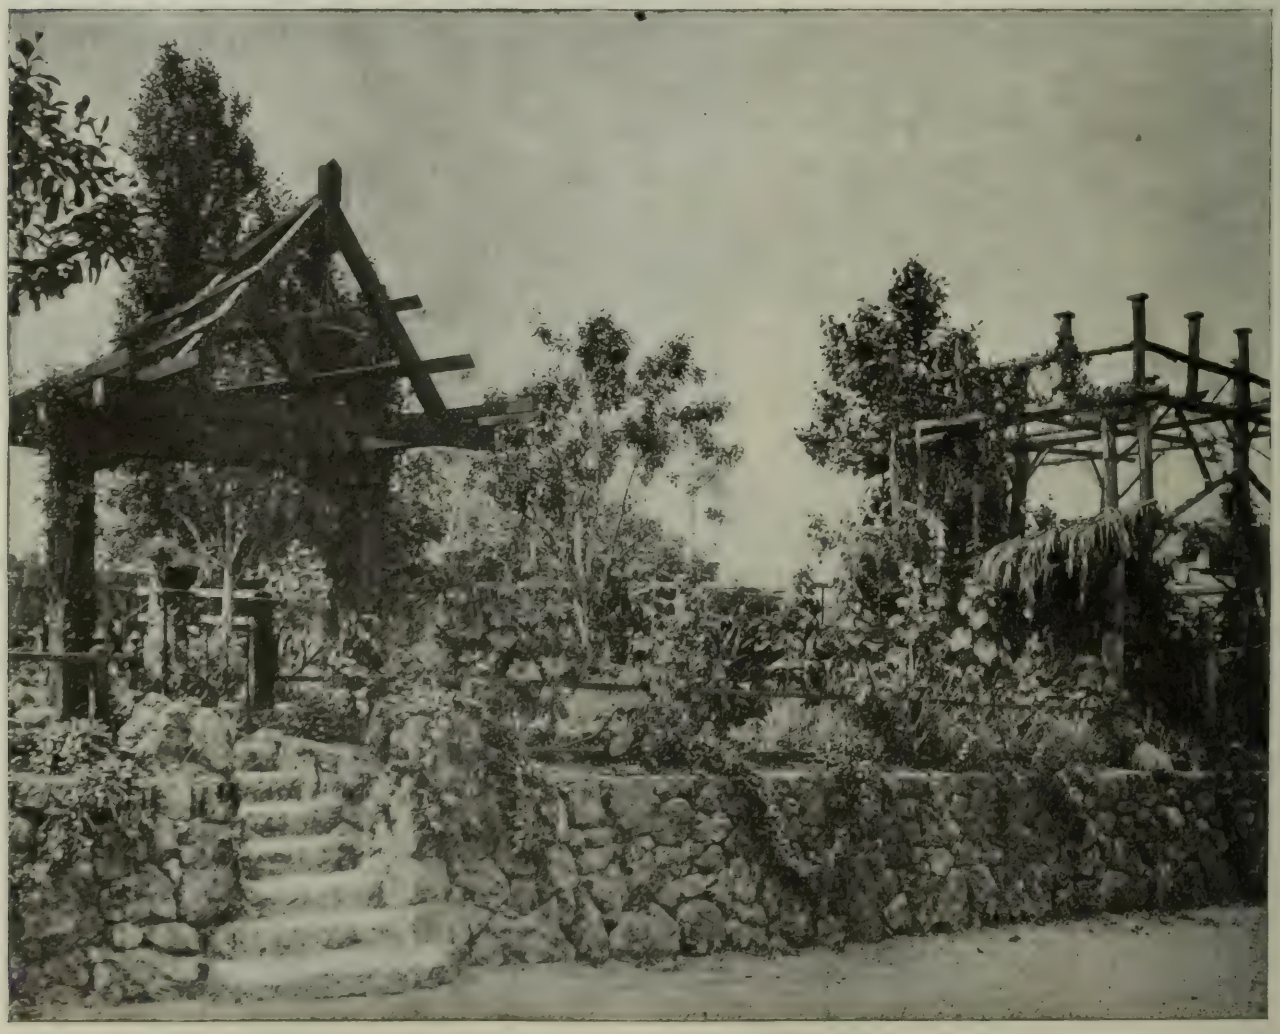
[16] Practical European Guide. *By M. O. Frazar.* Boston: Herbert B. Turner Co. $1.00.

Nature's Own Gardens. Written and illustrated in color and line by Maud U. Clarke. 8vo. Pp. 280. New York: E. P. Dutton & Co. $6.00.

This very handsomely printed and stout volume is illustrated with numerous delicate engravings in the text and fifty colored plates of plants in their native haunts, from the author's water-color sketches. Let the reader understand that these are all English and not American scenes and flowers, for the volume is imported. We especially like the delicate engravings, for they are carefully drawn and can be recognized; but the colored plates give rather a general effect than any exact drawing or coloring. Colored photographs of the plants in their natural surroundings would have been more valuable. And the coloration is by no means perfect. Thus the yellow of the English dandelion and the cowslip is far too red. The author tells pleasantly, but with somewhat prolix sentiment, the story of her searches in English fields and woods for the flowers she has painted. It is interesting to a lover of American flowers to see how English flowers look, for there are very few of the flowers here figured which grow here, altho many of them are familiar enough in literature.



The Garden Book of California. By Belle Sumner Angier. Decorations by Spencer Wright. 12mo, pp. vii, 141. San Francisco and New York: Paul Elder & Co. $2.00.

We have here a real Californian book for the garden. The author knows her subject well, is perfectly familiar with the flowers, shrubs and trees that can be well grown under the conditions of irrigation, and her instructions are pertinent, practical and clearly told as the result of much experience and observation. She does not advise any one to take up a home in California who does not expect to work as hard as in the East, but the results in beauty and comfort are most attractive. We in the East need to learn the value of irrigation when we want it. The suggestions as to the more

unusual plants, not all native, will be of no little value to readers in other sections of the country. It should be mentioned that the twenty attractive full-page illustrations of California gardening bear no particular relation to the text.

My Old Bailiwick. By Owen Kildare. New York: Fleming H. Revell Co. $1.50.

The author of "My Mamie Rose," Mr. Owen Kildare, has given us a picture of the Bowery "bum" in this volume of stories and sketches. He has intertwined comment and description, so that one not only gets a vivid idea of the "bum" and the reason for his continuing a "has-been," but also an understanding of the difficulties encountered in endeavoring to raise him out of the mire and the futility of the efforts some agencies are making toward that end. The most conservative estimate of the number of "homeless" men who sleep in the Bowery every night is 50,000. "Beds, bunks, cots . . . can be had on the Bowery for as little as 5 cents a night, and because there are men who have lost the faculty of earning, begging or even borrowing that sum, a nocturnal procession of over 10,000 parade in our streets, winter and summer, from midnight until dawn." What do we do about it? Not much. Mr. Kildare decries the spectacular methods of the Salvation Army; he severely criticises the "mission workers," with their numerous so-called "conversions." He speaks well of the work of the Bowery Branch of the Young Men's Christian Association, and glowingly of the Bowery Mission. But these are wholly inadequate. We need more real missionary work by a higher grade of men and women, who will live among the people somewhat as the people of the settlements do—the present settlements avowedly fail to reach the class in question.

TREATMENT OF A GARDEN WALL.
From "The Garden Book of California."

Editorials

Mr. Roosevelt's Railway Policy

In the President's speech at Indianapolis there is no indication of a desire to retreat from the position heretofore taken, but abundant proof of a purpose to press forward. He would have the people, thru their chosen representatives, perfect by additional legislation that plan for the effective supervision of railways which is outlined in the new Rate law. And he is confident that they will do it. "There can be no halt in the course we have deliberately elected to pursue." "There can be no swerving from the course that has been mapped out in the legislation actually enacted." The movement must be "forward toward a full development of this policy." Undoubtedly he measures correctly the desire and determination of a vast majority of the American people, to whom the policy which he defines has been commended by scores of suits at law and by memorable investigations. There will be no backward step.

Mr. Roosevelt simply desires and proposes that the power of the Federal Government shall be used effectively in the interest of the people, of innocent investors in railway securities, of all honest railway managers, and of the railways themselves; used also for the discomfiture of all railway gamblers and swindlers. In this address—which not only contains a comprehensive statement of his views on the subject, but also considers their relation to conditions of the immediate present—no action or legislation is suggested that would be unjust or would provoke complaint from any except "the predatory men of wealth" whose course as railway managers or influential railway capitalists the public has justly condemned.

To those features of his railway policy with which the public was already familiar we shall not refer. He now asks for a physical valuation of all existing railroad property, not in order that water injected into capital stock in the past may be squeezed out, but because such a valuation, confirmed by official authority, will be useful to the Government, to the people and to the roads. It will serve to prevent overcapitalization or inflation hereafter, to prevent an arbitrary official reduction of rates that should be permitted to stand, and in many ways to promote fair dealing and establish confidence in railroad securities, new and old. But it would not reach back to touch even such operations as those of the Chicago & Alton syndicate, for that would be unjust to innocent holders:

> "The effect of such valuation and supervision of securities cannot be retroactive. Existing securities should be tested by the laws in existence at the time of their issue. This nation would no more injure securities which have become an important part of the national wealth than it would consider a proposition to repudiate the public debt."

Taking the railroad property of the country as a whole, the President thinks that its value equals, or even exceeds, the face value of all the bonds and stock. That is to say, for overcapitalization and flagrant inflation on some roads there is compensation in undercapitalization on others. Supervision, assisted by an official valuation, would promote uniformity, and also honesty, where that has been lacking.

It is right that future issues of stocks and bonds by interstate railway companies or systems should be made under Federal supervision. Mr. Roosevelt prefers that power to exercise such supervision shall be obtained by means of Federal charters. Legislation requiring the national incorporation of such companies would greatly simplify procedure, and in their present mood concerning State legislation some companies would not oppose it. The President does not speak directly to the legislatures about the many restrictive State laws recently enacted, but he repeatedly points out that companies may be prevented by rigid statutes from making the improvements now so greatly needed, because such legislation discourages the investment of private capital in railway securities by tending to withhold a fair return upon the investment.

As to the comparative efficiency of

Federal authority and State authority, he virtually repeats, as follows, what he has said on other occasions:

"I ask that full power be given to the Federal Government because no single State can by legislation effectually cope with these powerful corporations engaged in interstate commerce, and, while doing them full justice, exact from them in return full justice to others. The conditions of railroad activity, the conditions of our immense interstate commerce, are such as to make the central Government alone competent to exercise full supervision and control."

At the present time many of the legislatures are finishing the work of a session. While there have been notable examples of just railway legislation, there have been other examples of ill-advised and arbitrary enactments which tend to confirm a growing opinion that such work should be done by national authority. In his address at Gettysburg, Congressman Tawney deplored the tendency of States to surrender powers and duties to the Federal Government, and even to solicit such a transfer, in order that expense may be avoided. In our judgment, the public interest requires that the rates and the security issues of all railways engaged in interstate business shall be under the exclusive supervision of Federal authority.

A few hours before the address at Indianapolis was delivered, Mr. William J. Wallace, who recently retired from the bench of the Federal Circuit Court to resume private practice, said at a dinner given in his honor by the bar of New York:

"In none of our political parties, as at present constituted, does there seem to be any hope of conservative action to stay the frenzied attack which is being made upon the prosperity of the minority. The Republican party, under its present leadership, has entered into a mad race with the leaders of the Democratic party to capture the votes of the discontented, the prejudiced, the unthinking, and the fanatical believers in socialistic theories."

Neither Mr. Roosevelt's address nor his executive action warrants these remarks about his policy and aims. The address is fair, reasonable and truly conservative. In support of his railway policy, by executive action he has led an attack upon not the prosperity, but the rascality, of a small but powerful minority, and the justice of his course has been confirmed by the repeated decisions and sentences of the judges with whom Mr. Wallace was recently associated.

Our Agricultural Colleges

THE fiftieth anniversary of the founding of the first agricultural college in the United States was fitly and notably commemorated by the address of President Roosevelt last week, at Lansing, in Michigan. This peninsular State has the double glory of having created the first State university and the first State agricultural college—the former in 1818 and the latter in 1857. The earlier foundation was significant of the ambition of the nation in its youth—a desire to rival England in the production of classical scholars and educated leaders. It was also significant as the summation of the will of the people to systematize their schools. The agricultural college was something different. It came in ahead of common school education in agriculture, ahead of manual training and training in the industrial arts. It expressed the grand foresight of that old Senator of Senators, Morrill of Vermont, that the United States, becoming intensely industrialized, must ultimately turn over its popular education from Latin and Greek to science.

It remains yet to solve the problem how best to industrialize the lower schools and adjust them to the colleges. At present there is a triple-linked power, consisting of the experiment stations, the agricultural colleges and the Government Agricultural Department. These are so correlated as to work together fairly well, and yet we find them reaching over the same territory in many cases, and repeating or duplicating essential work. The object of the State College in New York is stated to be to develop the agricultural resources of the State, in the production of crops of all kinds, in the rearing and breeding of live stock, in the manufacture of dairy and other products, in determining better methods of handling and marketing such products, and to increase the intelligence and elevate the standards of living in the rural districts. The college was authorized to carry on experiments and demonstrations on the farms and gardens, economic studies of the social status of

agriculture, and to publish bulletins embodying the results of researches in physical, chemical, biological and other problems of agriculture.

In every essential purpose the experiment stations are a part of the agricultural colleges, and go over the same work, adopting the same methods. They are less pedagogical, but equally experimental. There are over sixty of these stations; that is more than one to a State. With this duplication of purpose it is not surprising that, at the outset, the agricultural college did not meet the farmers' need. Nine-tenths of its graduates fell under the shadow of the classical college and sought lifework among the professions. Nor was it at all an easy matter to secure men qualified, both in spirit and training, for the faculty of such institutions. This evil has been admirably remedied, and no better equipped institutions are to be found in the world than our agricultural colleges at the present time, so far as the teaching force is concerned. The students nearly all pass straight forward into agricultural employment of some sort. Meanwhile agriculture has felt the stimulus. "Old Hayseed" is dead. The sciences are linked to farm work. Farming has become the most complex as well as most interesting of all employments. The arts also have reached over their prejudices and associated themselves with the land tiller. The telephone and the trolley supplement rural free mail delivery in destroying the isolation of the farm home. But all this does not do away with the fact that our industrial training, beginning at the top, still remains there. The great want of the present time is some way of affiliating the lower schools to the higher. We have got to solve the problem of how to teach agriculture in our common schools.

President Roosevelt falls under the error of supposing there is a shrinkage in farm population in our Eastern States. The relative shrinkage of this sort ceased before the opening of this century, and the relative growth of cities ended at least fifteen years ago. It is true that the cities are still growing, but they have not, since 1890, absorbed beyond one-third of the increase of population. At the present time we believe that, notwithstanding the enormous immigration of recent years, not more than one-fourth of the total increase is dropping into city life. We do not need to say that we believe this superb sociological fact is largely due to the agricultural college and its co-workers. All the same we shall agree with the President that everything should be done to encourage the growth of industrial training.

There is still an enormous work to be done, in the way of ennobling labor, of linking education of the head and the hand, of raising the conception of farm work. That agricultural work constitutes a profession, as truly as that work which is performed by the lawyer or the minister must and will be allowed. The rural school is rapidly becoming a town school, and as such is furnished with superior buildings, libraries, mechanical tools and a higher grade of teachers. Not a few of the high schools in rural districts are better equipped for teaching the sciences than most of our small colleges. This change is startling, as it is revolutionary. The classics will surely not lose their place in American education, but American history, American life, American work are coming to the front. When Mr. James J. Hill's 400,000,000 population fills up our valleys and covers our prairies we believe that we shall be ready to feed them; not only to feed them but to make of them a thoroly prosperous and well-educated population. We surely have got to do hereafter with great masses of men, and we have got to hustle in our preparation. The bulk of our people must live on the farm and be active producers. Doing this, farm life must be, as our President suggests, kept on a higher level; it must be dignified and brightened "to keep alive the pride and loyalty of the farmer's boys and girls, of the farmer's wife and of the farmer himself."

The vision ahead is that of a great co-operative community, in which the Government is simply the expression of the will and needs of the individuals. This vast co-operative population cannot be divided safely into laborers and capitalists; nor can there be recognized any difference in the interests of different employments. The Agricultural Department at Washington has developed mag-

nificently. It has not at a single point lost its contact with the populace. It works for the people. It is democratic in the fullest sense of the word. Subordinate to this Department, and really constituting a part of the Department, are the agricultural colleges. The call back to the land has gone forth and has been heard. The people no longer seek congestion, but distribution. These new educational institutions are the breath of the age, the instinct of the common people. They are a healthy indication of our nation's growth.

The Timidity of Photographers

We have recently had the pleasure of looking over some five hundred photographs which the readers of The Independent were kind enough to send us for the illustration of this Vacation Number. It was a pleasure—that is, for the first few hours; after that we began to feel like a Cook tourist in the Louvre, and the pleasure became absorbed in a growing sense of duty. We would have enjoyed looking at them more if we had not had to select for publication, because many of them were interesting even to those who were not on the particular picnic kodaked, many of them showed considerable technical skill, and many were beautiful enough to keep on the walls of one's living-room.

We must leave our readers to divine if they can the reasons for our choice of the photographs which fill the first sixteen pages of this issue. The disappointed contestants can get consolation from the old saying that there's no accounting for tastes. We have included several of Miss Boult's, but we wanted to put in more than we did, because they are such good examples of the modern *plein air* school, luminous in the shadows and harmonious in tone. Every photographer knows how difficult it is to get that effect. The reproduction in half-tone fails to bring out the depth and transparency of the originals. They avoid the extremes of the fuzzy-fog photographer and the universal focus picture with its microscopic detail.

Our chief difficulty in making a suitable selection was the lack of variety. There were plenty of pictures good enough to print, but the range of subject was very narrow and the style of treatment narrower still. There were some fifty babbling brooks, and about as many groups of cattle, wooded roads and rowboats. This shows unimpeachable good taste on the part of The Independent readers, but such a uniformity of good taste is monotonous. An occasional dash into the wilderness on either side of the highway where bad taste lies in wait would be diverting. In short, we have become convinced that the average amateur is either timid or lacking in imagination, and of course we choose the more courteous of the alternatives. Certainly he fails to realize the possibilities of modern photography.

One reason for this is that the amateur is too absorbed in the process to pay much attention to the picture. He will argue by the hour on the relative merits of pyro, hydro, eiko and all the other dative abbreviations of developers, but he does not care enough what his camera is pointed at. He does all his thinking in the darkroom. Now that we have come to develop films by the yard, we have learned that after the exposure is made a man has about as much influence over the negative as he has over next week's weather. He can spoil it by fussing over it, but he cannot help it much. Get your developer the right strength and temperature and let the unseen, unknown and unmanageable chemical forces do the rest.

It is a great mistake to devote too much time to technique and manipulation, because the object of photography is to free the esthetic impulse by relieving the artist of drudgery. The photographer starts with perfect skill in drawing and complete command of the laws of geometrical perspective, which his supercilious rival of the brush and pencil gains partially after laboring for two years at charcoal drawing from plaster casts and starving as long again in a garret in the Latin Quarter. In the same way the man who plays the piano with his feet has escaped four years of four-finger exercises. He is sure that the right notes will be struck and can devote his attention to making the music express whatever he has in him to express.

One might suppose that, starting freed from the handicap of training the fingers

to obey the intentions of their proprietor, the photographer would go on and develop the possibilities of monochrome reproduction, but as a matter of fact he rarely does. He does not even come close enough to the confines of his field to realize its limitations. A good way to learn what a picture really is and how to get one, is to practice imitating famous paintings. Only the kinetoscope people can afford to get up a battle for the purpose of photographing it, but you can do portraits and genre pictures so far as your models and costumes and properties allow. Exact imitations such as some of the magazines have published are not necessary. See if you can get the same effects in lighting, posing and expression with similar subjects. Then compare your photograph with that of the original and try to find out why the latter is a work of art and the former, probably, is not. If you can tell this, then you may be able to discover or to create a real picture for yourself.

Don't be afraid to experiment; not with new lenses and developers, but with new pictures. After you have learned how to pose and light a figure according to the book—three-quarters face, eyes turned back toward the camera, north upper window on one side and white paper screen on the other and all that—then try to see how many of these rules you can violate with impunity. Enlarge your pictures. Enlarging cameras can be obtained cheaply now, or you can make one out of your darkroom by sticking the lens thru a hole in the door. Don't be afraid of "faking" to get pictorial effects. It is nobody's business how you get your picture so long as you get it. With the new developing papers of all colors, textures and tones you can bring out your idea, if you have one. Mere size has something to do with the effect. Think how disappointing it would be to visit the Metropolitan Art Gallery if none of the pictures were larger than 5x7. When you show a large picture to your friends they naturally expect it to contain something worth looking at, and you do not want to disappoint them. You are then in a field where you must meet the competition of real artists. You will learn that it is more important to know how to focus the attention than to focus the camera. After you have practiced the arts of selection, elimination, subordination and gradation long enough you will have a better knowledge of the capabilities of photography as well as a better appreciation of the real value and interest of the old-fashioned hand-made pictures worked on canvas with a brush.

Mare's Nests

It has been sufficiently decided by the Supreme Court of the United States that Section 8, 3, of Article I of the Constitution, which gives Congress the power "to regulate commerce . . . among the several States," thereby gives Congress control of interstate commerce. Whether President Roosevelt is justified in his opinion that Section 8, 7, which gives Congress power to "establish post offices and post roads," allows Congress to supervise and regulate railroads within a single State, we do not now discuss. Our present purpose is to consider the somewhat surprising specifications which Congressman Tawney, of Minnesota, chairman of the House Committee on Appropriations, in an address on Decoration Day at Gettysburg, made to show that Congress is trenching on the duties of the States under the Constitution, and that we are on the road to dangerous centralization.

Let it be premised that the Tenth Amendment, reserving to the States all powers not delegated to the United States, is constantly quoted by the strict constructionists whenever new conditions seem to require that Congress take up new service for the people. Post roads are very different now from what they were in 1787, and so is the commerce between the States. The Preamble of the Constitution enumerates, among its purposes, to "insure domestic tranquillity" and "promote the general welfare." Again, in Article I, 10, 1, we are told that Congress shall have power to "provide for the common defense and *general welfare* of the United States." The "general welfare" has to do with matters of tremendous concern not thought of then. It is perfectly proper that the Supreme Court should find implied as well as explicit authority in the Constitution for doing things which the

people want, and are necessary for the "general welfare."

We give Mr. Tawney's list of the encroachments on State rights by Congress or the President. They need frighten no one:

1. "The recent surrender by the Southern States to the Federal Government of the exercise of the right reserved to them by the Constitution to maintain, control and regulate local quarantine."

Infectious diseases enter our ports and cross interstate boundaries. The "surrender" referred to was in the case of yellow fever requiring quarantine in Southern ports, and especially the guarding against its being transported across the river between Louisiana and Mississippi. The crossing of the river is interstate commerce, which is particularly given into the charge of Congress, in Article I, 10, 3, "to regulate commerce with foreign nations and among the several States," while at the seaports yellow fever comes in thru "commerce with foreign nations." "General welfare" certainly allows Congress to take advantage of its powers in this respect, when the States desire:

2. "The practical surrender by the State of Maryland of the control over her oyster beds."

But these oyster beds are in sea water, and were being invaded by citizens of other States. Certainly Congress has the right to control the general water front and to make full surveys:

3. "The Federal inspection of the products of private manufacturing establishments, and the sanitary inspection are centered in the establishments themselves."

That means the beef "inspection." But this control is needed for "public welfare," and is justified by the fact that "these meat products are for interstate and foreign commerce." Further, Article I, 10, 2, distinctly declares that wherever States pass "inspection laws," such laws shall be subject to the revision and control of Congress." This plainly implies the right of Congress to make such inspection laws:

4. "The Federal inquiry into woman and child labor in local industrial occupations, with a view to securing Federal legislation and control."

Then thus far it is only inquiry, with no legislation. We see no reason why Congress should not be allowed to make inquiry on any subject which affects the "public welfare," and certainly this does; and a vicious practice in one State affects commerce in another. Further, the President is directed, Article II, 3, 1, to recommend to their consideration such measures as he shall judge necessary and expedient"; and how can he do it without such inquiry as Congress may authorize?

5. "The inspection of cattle and all other agricultural products; the investigation of soils in which the Federal Government has no interest; the care and disposition of timber on State lands; the actual breeding of horses and cattle primarily for the benefit of the few fancy stock raisers of the country."

These are all acts of "inspection," or other information purely for the benefit of the people. We wonder Mr. Tawney forgot to include the Weather Bureau. We have a Department of Agriculture, but most of the work spoken of is undertaken by the States, on Federal appropriations at agricultural stations. Fine Jersey cattle are raised to promote the "general welfare," not to please fancy stock-raisers, whose profits it reduces. It is for the people generally that information is given on soils and seeds and cattle, just as merchants are benefited by the daily "Consular Reports" of the Department of Commerce and Labor:

6. "The making of geological and topographical surveys of States . . . of cities and counties."

Why should not the Federal Government make such surveys and maps, and do this most minutely where the most people will be benefited thereby? It is "general welfare," and interferes with no State rights:

7. "The free testing of coal, . . . of building materials, . . . the free gauging of streams."

Again, this is for the "general welfare," and of course for the advantage of special persons also. The Geological Survey will study the quality of coal mines, not so that a speculator may exploit them, but to protect the people. The flow of water in a river is gauged and the people get the advantage if they want to use its force for municipal or private lighting. It is a part of the general system of helping the people. More is done for the people, and at a greater

expense than ten years ago, and the States do not object and the people like it. These things are not specified in the Constitution, and the makers of the Constitution never thought of them. We might put them in were we to write a Constitution now. By the Quaker way of common consent they are accepted as properly belonging to the domain of the Federal Government, because they concern the "general welfare," and it is the simplest and easiest and fairest way of interpreting the meaning and purpose of the Constitution. Complaint is futile.

One Man City Government

Not only residents of the District of Columbia, but also all urban dwellers in the United States, will find much to think about in a report that has just been submitted to the President by his special adviser, Mr. James B. Reynolds, regarding the administration of the affairs of the District of Columbia.

Mr. Reynolds, whose qualifications for a critical estimation of plans and workings of municipal government are well known, has looked over the situation presented by the District of Columbia with detailed thoroughness, and he makes to the President a number of highly important recommendations, among which are these: The creation of the office of governor at a salary of $10,000 a year; the creation of departments of health, police and fire, buildings and public works, street engineering, charities, corrections, housing and labor, each to be conducted by a commissioner to be paid $5,000 a year; the creation of a municipal council composed of the commissioners, and constituting a public assembly for the passage of ordinances, regulating the affairs of the District; and the creation of a citizens' committee of one hundred to represent all civic interests.

At present the administration of the affairs of the District of Columbia is conducted by three appointed commissioners in no way responsible to the people of the District, who have no power of election. Two of the commissioners must have been actual residents of the District for three years next before their appointment, and have during that period claimed residence nowhere else. The third is detailed from time to time from the Engineer Corps of the army. The administration of these commissioners is in fact and in spirit a class, or aristocratic, government. It is the municipal rule of a population by a superior power quite independent of the fluctuating will of the municipal populace.

The radical features of Mr. Reynolds' recommendations are, first, the creation of a council in which both ordinance making and administrative functions shall be united; and, secondly, the proposed substitution of the one-man administrative authority of an appointed governor for the present responsibility of the board of commissioners.

A vast amount of experience supports the contention that any attempt at too rigid a separation of administrative and legislative functions is unwise. The development of English government has been in the direction of lodging undivided authority and responsibility in the town council, which appoints its own executive committees. American experience with divided responsibility in mayor and council has been so unsatisfactory that we also have begun working toward unity, but by a plan the direct opposite of the English. We elect a mayor with ample authority, and then give to the heads of departments, which he appoints, the powers and functions of a council for purposes both of legislation and administration. That, substantially, is the plan of the constitution and powers of the Board of Estimate and Apportionment in New York City, and that, substantially, is the plan recommended by Mr. Reynolds for Washington.

But this plan, as applied to Washington, may be a curious misfit. One-man responsibility, as all students familiar with the history of American municipal government are aware, has been evolved in this country as a means of meeting the inconveniences and irresponsibility of party control in municipal affairs. Bi-partisan boards and bi-partisan councils too often mean the negation of any responsibility whatsoever. On the other hand, all experience with appointive authority administering the rule of an aristocratic class or any superior power has gone to show that a board or commission, in which different views may find

expression and action may be taken only thru agreement, is more judicious, more flexible, more reasonable, more considerate of rights, than the single or one-man administrative agent. Mr. Reynolds apparently has failed entirely to take this fundamental difference of conditions into consideration.

There is one point, however, in his recommendations which is most admirable, and which the American people in general, as well as those especially charged with responsibility for the government of the District of Columbia, may well take under careful advisement. Mr. Reynolds recommends that the proposed Governor of the District of Columbia, who would be also Mayor of the city of Washington, should be not necessarily a resident of the District, but preferably a man who had demonstrated his ability as a municipal executive thru service as the successful mayor of some other city of not less than 50,000 inhabitants.

This is the German plan and it has given to German cities the best municipal administration to be found anywhere in the world. The great cities of Berlin, Leipsic and Frankfort would not think of confining their choice for mayor to their own citizens. Their practice is to call a man who has had a record of success in smaller towns, just as a great American university may call to its presidency a man who has demonstrated his ability in a smaller institution.

The introduction of this habit of promoting mayors from small to large towns in America would work a wonderful transformation in the quality of American municipal government.

The Church in Social Reform

Somebody has said, a bit flippantly, that lawyers are down on the ground and in the game with the men, and so are doctors down with them and in the game, but that ministers are sitting up in the gallery with the ladies and looking on. We do not accept this view, for we observe that ministers and church people generally are as much interested, to say the least, in matters of public betterment as any one else. And we observe that at all public meetings for public betterment ministers and church people are called very much to the front.

Nevertheless, other organizations than the Churches are taking a very active part in social progress, often because they think that some better work can be done when the ecclesiastical brand is removed. Such are certain ethical societies and social settlements, which do not put religion in the foreground, but are intensely devoted to moral and social reform, especially in our congested populations. There is, certainly, an altruistic and ethical purpose in many labor unions, while various provident and insurance organizations have much the same aim.

We are not of those that hold that the Church should so concentrate to itself the various tasks for social betterment that all other agencies should be absorbed. For example, while the Church ought to give its full influence for temperance, or for tenement-house reform, or for education, or for the protection of women and children, yet those not in the Church should bear their part, and provision should be made for their undenominational co-operation. It is not so much the Churches officially acting as it is the individual members whose service is required.

And that service is given. If one were to read the list of any body of men engaged in altruistic service, it will be found that the majority of them come from the Churches. It is the teaching of the Church that gives them their impulse. In the social settlements and people's institutes this is to be observed if the roster is read. Their service is to be credited to the Churches—Protestant, Catholic, Jewish and Ethical Culture (for the latter is a real Church)—of which they are members.

This fact comes to our mind in reading the report of a conference on social-ethical problems held at Union Seminary, in this city, last week. There were present Presbyterians, Episcopalians, Congregationalists, Unitarians and Jews, and men connected with settlements whose denominational relations are not known to us. They agreed to organize a movement to bring into closer relationship the different forces of the social-ethical movement, embracing both those inside and outside the Churches, and in-

cluding the representatives of organized labor; and to hold conferences for discussion and mutual information. It was especially sought to organize a bureau of speakers and literature which should work in a double direction—both from the outside toward the Church, bringing it information and inspiration on all social-ethical movements, and, conversely, from the Church, carrying its fraternal sympathy and aid to these various efforts for social improvement.

Such efforts to co-ordinate more closely the influences of the Church and the efforts of those engaged in moral reform are of no little value, but the chief service is rendered by those who are both in the Church and also in these social movements, and what churchman should not take a deep interest in the better physical and moral as well as spiritual elevation of those whose circumstances make the struggle for decency and character and comfort a hard one.

San Francisco and the Japanese

We judge that San Francisco is corrigible, for the earthquake, tho disastrous enough, did not cause so utter a destruction as that which befell Sodom. San Francisco is now trying to mend its ways, and is bringing its officials before the courts for trial, and is reorganizing its government. But San Francisco is trying the patience of the country with its treatment of its Japanese residents. The action as to the schools was unpardonable, and absolutely violated the Constitution, which declares that "all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the constitution or laws of any State to the contrary notwithstanding." There can be no question that a treaty overrides State law; the only question is as to the interpretation of the treaty. And now the vicious attacks of mobs on Japanese citizens gives occasion for Japanese demands for redress. To be sure, mobs are not responsible, but the country is, and they involve the country in serious danger. To be sure, we recall that after the news of the Portsmouth treaty American property was destroyed in Tokyo by a Japanese mob, so that honors—or horrors—are easy. We hope that San Francisco may have a reprieve and that the warning she received may suffice.

Employment Agencies

The evils and dangers attaching to employment agencies in large cities have lately been carefully studied by trained investigators with results to appall the uninitiated. Ignorant immigrants are sent to what are nothing less than prison camps, and innocent girls sold as white slaves. This investigation has led to the passage of an act by the Legislature of Pennsylvania for licensing and regulating employment agencies in cities, which we commend to other States. Under the act every employment agency must be licensed by the chief police official in the city. The applicant must file a bond of $1,000, so as to protect any person aggrieved by misconduct. There must be no liquor sold in the building, nor must liquor be given to the applicants. Accurate records must be kept, in the English language, of fee charged, and equally of all who seek to engage applicants, with class of work and hours and wages. The fee charged is good for one month, and no extra fee must be asked. Applicants sent out of the city must have a full memorandum in a language they can understand, of place and destination, nature of work, wages and hours. No female employe shall be sent to any disorderly place, and no person of bad character shall be allowed to remain in the agency. The law is full, explicit and excellent, but it will not execute itself. It needs the careful supervision of those citizens' committees which concern themselves with the public welfare.

The "Power"

It is very difficult for us, in our undemonstrative life, to comprehend the experiences described in the Book of Acts as to the converts who were "filled with the spirit." But we seem to see apostolic times come down to us when we read the accounts of the extraordinary revival in the Methodist and Presbyterian churches

of Korea. One man was making confessions of a sinful life:

"When he finished speaking he flung himself upon the floor in great agony and begged for mercy. The scene that followed was indescribable. Men were stricken to the floor all over the church as if hurled there by a thunderbolt. They writhed upon the floor and cried out for mercy in great agony of remorse. So great was the distress in every direction that no one could turn either to this one or that one to give aid; indeed, the only aid that they seemed to want was the privilege of rising to their feet and confessing their sins."

Another man made confession of a certain sin:

"He was stricken to the floor and wallowed there as if tortured. Later he arose to his feet and continued a moment with his confession, when he was again hurled to the floor. He lay there some time unconscious. Our physician spent a few moments over him and some of the brethren gathered at his side, but directly retired leaving the man in the hands of God. Soon he recovered and again attempted to get to his feet, and two of the brethren supported him, but he was unable to continue his confession that day. At this meeting others were in as deep distress as he, and the church floor was covered with the slain of the Lord, and their agony for their sins is indescribable. On one occasion, a man beat the floor till he left the marks of his bloody fist on the boards, and appeared utterly unconscious of what he had done. The sobs and groans of the penitents could be heard at a great distance from the church and the repetition of such scenes filled the city with wonder and fear. During a number of the meetings many outsiders came in, some to mock and jeer, but among them were those who were also overwhelmed with the rest."

Koreans are generally regarded as of a very impassive temperament, and this outbreak has astonished the missionaries, but they accept it as from God, just as they have been inclined to accept the Korean idea that demons take possession of people there as they did of the people in the time of our Lord. The experiences are of both psychological and religious interest and importance, and help us to interpret New Testament language.

What has made the British Empire? What has made the United States? Different interests will give different answers. But it is not the highest and best answer that we read in a speech made by Mr. Deakin, Prime Minister of the Australian Federation, at a dinner given to the Premiers by the London Chamber of Commerce. He said:

"Trade made the Empire. Trade requires to maintain it. Trade being the first consideration, surely the views of the trader should be the first to which public opinion should listen. . . . We repudiate any attempt to influence your judgment in this matter by appeals to sentiment. Business first, and while you are dealing with the business side, business only."

But has not a wiser "Symphony" said:

"O Trade! O Trade! would thou wert dead!
The Time needs heart—'tis tired of head:
'We're all for Love,' the violin said, . . .
And ever Love hears the poor folks crying,
And ever Love hears the women sighing,
And ever sweet Knighthood's death-defying,
And ever wise childhood's deep implying,
And never a trader's glozing and lying."

Louis Havet, in discussing "Simplified Spelling in French and English," as our readers will remember, observed that a French child learning English cannot understand why *wrong* and *right* begin with different letters. The tale is told of the countryman who asked what the big letters W and R stand for which he saw every little distance posted along the railroad tracks. He was told they stood for "Ring" and "Whistle." The explanation satisfied him for a moment, and then he shook his head and asked: "I see how W stands for 'Wring,' but how in thunder can R stand for 'Whistle'?"

The next Protestant Episcopal Convention will meet this year in Richmond, Va. We are glad to hear it rumored that there will be an attempt to bring the Reformed Episcopal Church back into the larger body, from which it fled thirty years ago from fear of ritualism. There ought to be free space in that "roomy" Church for both the lovers of ritual and those who oppose it. The Reformed Episcopal Church has hardly justified its separate existence.

Sir Hugh Bell, president of the British Steel Institute, is quoted as predicting that the time will come when, with scarce any crew, ships will be propelled across the Atlantic by wireless force generated at Niagara Falls. That sounds incredible, but we have the incredibles already achieved.

Insurance

The Indictment of Jordan

NINETEEN indictments were found last week, in connection with year-end transactions, against Thomas D. Jordan, ex-controller of the Equitable Life Assurance Society. One of these indictments was for perjury and the other eighteen for forgery in the third degree. The indictments against Jordan are based partly on the Equitable's transactions with the Mercantile Trust Company at the end of 1904 and partly upon the so-called "Kuhn-Loeb loans." Mr. Jordan, who absented himself from this State just prior to the Armstrong-Hughes investigation, appeared in court on Wednesday last, and a plea of not guilty was entered in his behalf. Bail was fixed at $10,000, which was promptly furnished. The Jordan indictments were similar to those found against John R. Hegeman, to which reference was made in this department last week.

Burnham Held to Have Been Wrongly Convicted

THE Appellate Division of the Supreme Court, with the concurrence of the five sitting judges, on Friday of last week reversed the verdict whereby George Burnham, Jr., ex-vice-president and general counsel of the Mutual Reserve Life Insurance Company, was convicted of grand larceny. The decision, written by Justice Ingraham, may save Frederick A. Burnham and ex-Vice-President George D. Eldridge, now under indictment for participation in the transaction now held to have been wrongfully used as a basis for the conviction of George Burnham, Jr. Some four months of a two years' term in Sing Sing had already been served by Burnham when the Appellate Division granted him a new trial. The Court holds that, as in the case of George W. Perkins, charged with larceny, criminal intent was not shown in the Burnham case. The evidence before the jury, according to Justice Ingraham, did not justify the conviction, the evidence was improperly admitted by the lower Court, and Justice Greenbaum, the trial judge, wrongfully charged the trial jury.

THE Prudential Insurance Company of America, of which ex-Senator John F. Dryden is president, announces that all its industrial policies now in force under which the insured have attained age seventy-five, or under which the insured may attain age seventy-five during the present year, will be made free or paid-up policies, and the further payment of premiums will not be required. This is easily the most important voluntary benefit ever granted by the Prudential.

AN organization has recently been formed by ten or fifteen young women in Midland, S. Dak., that is calculated to encourage thrift and life insurance. The society as now organized is purely local, but its plan and scope may easily take on a national if not a worldwide application. The founders have named the infant organization the "Marriageable Young Ladies' Protective Society." Its avowed object is, in brief, "the promotion of sensible marriages and the prevention of domestic unhappiness and of divorce proceedings after marriage." Believing that an ounce of prevention is worth a pound of cure, each charter member has signed a cast-iron pledge in which she agrees under no circumstances to marry a man who has less than $2,000 in cash or its equivalent, and has not an insurance upon his life of $2,000 or more. The work of the insurance canvasser, which has only too often been carried on under the most discouraging of circumstances, has in the South Dakota organization received the most pronounced aid and abetment. Under the new order of things to be inaugurated by the "Marriageable Young Ladies' Protective Society," poverty will be forced to take a back seat, so to speak, and love will accordingly cease to fly out of the window. The machinery of the divorce courts will no longer be so active as it has been, and it may presently be possible to eliminate divorce altogether if the plans of the South Dakota maidens are properly worked out. Eastern girls are watching the experiment of their South Dakota sisters with eagle eyes and much fluttering in the dovecotes. Eastern application of the South Dakota idea may be looked for in the near future if all goes well.

Financial

Tariff Agreement With Germany

If we consider only the tariff reductions actually made in the new temporary agreement with Germany, the advantage appears to be very decidedly on the side of the United States. Upon 96.7 per cent. of the imports into Germany from this country (about $225,000,000), Germany's minimum rates are conceded to us. On a considerable number of articles rates from 25 to 50 per cent. below even the minimum schedules are granted. On the other hand, our reductions affect only 1.4 per cent. of Germany's exports to this country, and are really almost valueless, as they relate only to argols, brandy, wine, paintings and statuary. In figures, the reductions of duties are $6,664,000 one one side and only $208,168 on the other. But no further concession in rates could be made on our side, except by a treaty of reciprocity. Such a treaty must be ratified by the Senate and approved by the House.

We do concede something, however, in addition to the slight reduction of rates. We grant open hearings on reappraisements at the Custom House; our agents sent to Germany to investigate as to values will work in the open and have an official status there; the appraisals of German Chambers of Commerce will be accepted as competent evidence, and the "market value" upon which our duties are levied will be the German "export price" when the goods are sold wholly for export or sold at home only in small quantities. These new regulations will tend to decrease the *ad valorem* duties heretofore paid on imports from Germany and to prevent friction at our custom houses. With all due allowance, however, for these administrative concessions, the advantage will be largely on our side. But all this is temporary, for Germany expects a more even exchange to be made in the near future by treaty or by means of the enactment here of a dual tariff.

....The Pennsylvania Railroad Company now has 45,496 stockholders, the largest number in its history, and twice as many as it had ten years ago.

....By the Census Bureau the value of last year's cotton crop in this country has been placed at $721,647,237. This includes $81,335,699 for cotton seed.

....Canada's foreign commerce increased by 17½ per cent. in the twelve months ending with March. Imports were $340,374,000, of which $208,721,000 came from the United States, and $83,229,000 from Great Britain.

....Referring to the subject of school bonds, mentioned in the article on bond investments in our issue of May 23d, it may be said that information regarding school bonds can be given to investors by the William R. Compton Bond and Mortgage Company, of Macon, Mo.

....It is reported that the resignation of William Ellis Corey, president of the United States Steel Corporation, whose recent marriage excited much public criticism, is in the hands of Judge Gary, chairman of the board, and that Mr. Corey has sold his holdings of the Corporation stock.

....The annual international commerce of the world now amounts to a little more than 26 billions of dollars. Imports are 13¾ billions, and exports 12½ billions. Of the imports of countries other than the United States, 14½ per cent. are drawn from this country, and 9½ per cent. of their exports are sent to us.

....Official reports show that in 1906 the port of New York handled 66 per cent. of the entire foreign commerce of the United States. Boston was second, with 7 per cent., and New Orleans third, with 6 per cent. Of our exports, 35 per cent. were shipped from New York, Galveston, with 9½ per cent., standing second.

....The copper output of the United States in 1906, according to the final estimate of the *Engineering and Mining Journal*, was 917,620,000 pounds. This quantity exceeded the output of 1905 by a little less than 5 per cent., and that of 1904 by 12 per cent. Montana stands first in the list, with 299,850,000 pounds to her credit, Arizona (263,200,000) second, and Michigan (224,071,000) third.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Speeches by the President

Last Monday was Georgia Day at Jamestown. The President went down on the "Mayflower," arriving early in the morning. He was to be present at the formal opening of Georgia's State Building, which is a reproduction of Bulloch Hall, the ancestral home of his mother at Roswell, Ga. After reviewing the fleets, he made an address on the Exposition grounds, having been introduced as "the most distinguished of Georgia's distinguished grandsons," who from "his Southern mother had imbibed largely the ideals which had placed him before an admiring country as one who means to do his duty by all." After speaking at some length of Georgia's history and progress and the essential characteristics of the American people, he turned to the application of remedies for wrongs, saying that we should avoid vindictive hatred of the wrongdoer and should not exact revenge. The South had shown remarkable growth in the last twenty-five years, but there was room for more, and the South, he remarked, would be all the better for immigrants of the right kind. He hoped to see steamship lines established for bringing such immigrants to Savannah and Charleston. Good education should be given free in the South to all children, no matter what might be their race or color. He pointed out the need of industrial education, and urged a war upon the evil of child labor in factories. He argued that all ordinary and extraordinary risks should be assumed by the employer, and spoke of "the extreme unwisdom of railroad companies in fighting the constitutionality of the Employers' Liability act." This law must be kept on the statute books "in drastic form." He closed with a tribute to the navy. In the afternoon he spoke before the National Editorial Association, beginning with advice to writers for the press, and then turning to taxation and to projects for the conservation of our national resources. Recent history of legislation and executive action for the creation of forest reserves, irrigation and the protection of public lands was reviewed. The President still hopes, he says, to obtain legislation authorizing the leasing of coal lands on a royalty basis. There should be, in his opinion, both a Federal graduated income tax and a Federal progressive inheritance tax, especially the latter. "I do not believe," said he, "that any advantage comes either to the country as a whole, or to the individuals inheriting the money, by permitting the transmission in their entirety of such enormous fortunes as have been accumulated in America."

The Idaho Murder Cases

For the trial of William D. Haywood, charged with the murder of ex-Governor Frank Steunenberg, the jury was completed, at Boise, Idaho, on the 3d. Nearly all of the jurors are farmers; all are married men, and the average of their ages is fifty-six years. In his opening address, James H. Hawley, chief prosecutor, promised to show that the murder was an act in pursuance of a great conspiracy of the leaders, or "inner circle," of the Western Federation of Miners; that these leaders employed assassins and were responsible for many other murders. After witnesses had testified as to the assassination of Steunenberg and as to the proof against the murderer; Harry Orchard, who has confessed his guilt, took the stand and related an appalling story of his crimes. He is forty-one years old, his real name is Albert E. Horsley, and he was born

at Wooler, Ontario (Canada), where he was a cheese maker until he ran away to the States with another man's wife. Our summary of his long and circumstantial narrative must be brief. He joined the union at Burke, Idaho, and took part in the meeting when plans were made for the destruction of the Bunker Hill and Sullivan mine buildings, in April, 1899. A thousand armed miners captured a railway train and went to Wardner to attack the mine. There were three explosions. Orchard lit the fuse for one of them. Steunenberg was then Governor. When the Federal troops came, Orchard went to Butte, and thence to Arizona and other places, arriving at Cripple Creek, Colo., in 1902. Moyer and Haywood were officers of the union. He sought, for $200, to blow up the Vindicator mine and to kill fifty non-union miners, but failed. Then he placed in the mine a bomb which killed Superintendent McCormick and another man. For this he was commended by Moyer and Haywood, who gave him $500. After 1903 he did not work, but plied the trade of an assassin. At one time he gave one Scott, a chief of detectives, information about a plot to wreck a train, a plot for which he had not been employed, but his connection with this man appears to have been brief. At the suggestion of Moyer and Haywood, he and Steve Adams, he said, plotted to murder Governor Peabody, both by shooting and by a planted bomb. They were prevented by circumstances which he described. Then, at Pettibone's suggestion, he shot and killed Lyle Gregory, a deputy sheriff. At the request of Haywood, he and Adams blew up with giant powder the station at Independence, killing fourteen non-union miners. The history of this crime was given in detail. The two fled to Colorado Springs and then returned to Denver, where they received congratulations and $500 from Haywood and Pettibone. Some time later Orchard received $650 more. Then, under the same influence, Orchard sought to assassinate Frank Bradley, a mine manager, in San Francisco, first by putting strychnine in a bottle of milk, and, second, by a bomb at the victim's door. Bradley was severely injured and permanently crippled. Pettibone paid $450, expressing regret that the job was incomplete. Returning to Denver, and obtaining $125 more, Orchard responded to Haywood's suggestion that he should kill Supreme Court Judge Gabbert, for a decision against Moyer, and also Judge Goddard, for helping to defeat the eight-hour law. He lay in wait for Gabbert, but there was no good opportunity. He planted a bomb for Goddard in a pathway, and it killed a man named Wally. By the breaking of a string, Goddard was saved from another bomb planted at his gate. A bomb for Peabody was prepared. Haywood then suggested the murder of Steunenberg. Moyer concurred. Four men (Orchard not included) were at first employed. They failed. Then Orchard and John Simpkins took up the work. Together they placed a bomb in November, but the connecting string broke. Simpkins (a member of the union's executive board) went away. In December, Orchard at first sought an opportunity to shoot Steunenberg, and then planted the bomb again. This time it exploded and killed Steunenberg. Orchard had received $240 from Haywood, in the presence of Moyer and Pettibone. [Many of the details of his story have been confirmed by Judge Gabbert, Mrs. Peabody, Mr. Bradley and others.] Orchard's story consumed the greater part of two days. Under cross-examination, on the 7th and 8th, he told again parts of it. He admitted that he was guilty of bigamy, and that he had burned, for the insurance, a cheese factory in Canada and a saloon in Colorado. At Cripple Creek he had found W. F. Davis, who had led the attack at Wardner, and it was Davis who suggested the crime on the Vindicator mine. Immediately thereafter he came to know Moyer, Haywood and Pettibone. The defense sought to show that he was in the employ of Scott, the chief of detectives. Orchard admitted, as before, his temporary connection with Scott, from whom he obtained a small sum of money, but said he was lying to the man after telling him about the plot to wreck a train. Evidently, the defense will rely upon this testimony in part to support its theory that Orchard was in the employ of the mine-owners. There will be an attempt to show that in killing Steunen-

berg, Orchard was moved by personal hatred. The testimony has been reported at great length in the daily press.

Suits Under the Sherman Act

It was reported some days ago that the Government was about to sue, for violation of the Sherman Act, the railways engaged in the bituminous coal trade in the Eastern States, these being the Pennsylvania, Baltimore & Ohio, Chesapeake & Ohio, Norfolk & Western and one or two others. The projected suit, it was said, related to a combination based mainly upon an agreement for an allotment of traffic and a maintenance of rates, the same having been in force for several years, and also upon discrimination against independent mine-owners. Denial of this report, however, was made at the Department of Justice, but it appears to be admitted that the Department is preparing suits against the railroads and allied mining companies which control the anthracite coal trade, the roads being the Reading, Lehigh Valley, Jersey Central, Lackawanna, Erie, Delaware & Hudson, and possibly the Pennsylvania. It is understood that suits will be brought in Philadelphia. Before he was elected Governor of New York, Charles E. Hughes was employed by the Government, with Alexander Simpson, Jr., to make an investigation concerning these roads and the coal trade. A report has been submitted by Mr. Simpson and Mr. Todd (Governor Hughes's successor), and it it said that Assistant Attorney-General Purdy will have charge of the case.—— At St. Paul, in the pending case against the Standard Oil Company and its seventy subsidiary corporations, the Government has been successful in the preliminary proceedings, all the defendants' exceptions having been overruled.—— Upon complaint of certain newsdealers, prominent representatives of the Chicago *Record-Herald, News, Examiner and American* have been arrested for violation of the State's Anti-Trust law. It is alleged that these papers combined to advance the price of their Sunday issues from 5 to 7 cents, and forbade the dealers to sell the Chicago *Tribune* because it had declined to become a party to the agreement.

Railway Problems

The facts brought to light by the Harriman investigation have recently been the subject of several conferences at the White House, where the question considered was whether the evidence would warrant the prosecution of the railroad companies or of Mr. Harriman. Secretaries Taft, Root, Cortelyou and Garfield, with Attorney-General Bonaparte and members of the Commission, have taken part in these conferences, the last of which was held on the 7th. While no official statement has been made, the conclusion appears to have been reached that the evidence does not warrant a criminal prosecution of Mr. Harriman (who is said to have gained immunity as to some offenses by testifying), and that the success of a prosecution of the companies for violation of the Sherman act cannot be predicted with certainty. It is understood that the Commission is divided on these questions. The Government will soon, however, proceed against Mr. Harriman in the courts to compel him to answer the questions which he declined to answer during the investigation. The Commission will submit a report upon the whole inquiry to the Department of Justice, and a careful examination of all the evidence will precede a final decision as to the Government's course.——In the Sugar Trust rebate cases, the Great Northern road's demurrer has been overruled, and the Western Transit Company has pleaded guilty, paying a fine of $10,000.—— In Minnesota, several railroad companies are opposing in the courts the two-cent law, and it is said that the railroads of the country will unite in testing the constitutionality of such statutes. On the other hand, Minnesota's Governor and Attorney-General have invited the Governors and Attorney-Generals of several other States to confer with them concerning support of the rate laws recently enacted.

Wage Increases and Strikes

Nearly 200,000 employees in the cotton factories of New England have received a considerable increase of wages. The addition at Fall River, where the movement began, was about 10 per cent., taking effect on the 27th

ult. This was also the rate of increase in many mills elsewhere, but the addition in New Hampshire and Maine and at Lowell (taking effect on the 3d) was 5 per cent. It is estimated that the entire annual increase exceeds $7,500,000. Wages in the New England cotton mills are higher now, as a rule, than ever before. One prominent company in Maine says that the increase at its mills since 1899 has been 35 per cent.——According to the report of the arbitrators appointed some weeks ago, the additional pay granted to the officers of the coastwise steamships of the Ward, Mallory, Clyde and other lines amounts to $30,000 a year.——An advance of about 10 per cent. to employees of the Burlington Railroad system was made last month. ——In the Pacific Mail annual report, published last week, a decrease of net earnings was accounted for in part by the explanation that the increase of wages during the year had been from 15 to 33 per cent.——At the mills of the International Paper Company, in Berlin, N. H., an eight-hour day has been granted. Similar action is demanded by several thousand employees of the paper mills in Holyoke, Mass.——In San Francisco, where more than 30,000 employees have been idle on account of strikes, 8,000 ironworkers resumed their places on the 1st upon the old terms, but with the understanding that by a gradual reduction an eight-hour day should be reached within three years. It was partly on account of the ironworkers' strike that the shipbuilding company which constructed the "Oregon" recently turned over to the Government the unfinished cruiser "California," being unable to complete it. These builders will take no more contracts for warships.——On the 25th ult. the Union Pacific Coal Company closed its collieries in Wyoming, from which many cities and towns have been supplied. This action was due to the organization of union lodges. According to press dispatches, the company gave notice that no union man would be employed, and warned 1,400 union members that they must vacate the company's houses.——The threatened strike of 40,000 bituminous miners in the Pittsburgh district has been averted. They objected to the introduction of new automatic dumping machines, alleging that the use of them reduced their wages by 17 cents per ton. Certain parts of the machinery have been laid aside, pending arbitration of the whole question. —— Preparations have been made for a strike of the Western Union telegraph operators, who assert that the increase of 10 per cent. granted on March 1st has been paid to only a little more than half the men. They also ask for an eight-hour day and demand the reinstatement of employees alleged to have been discharged because they were union officers. The matter will come before the company's directors on the 13th.

Santo Domingo's Debts

The treaty with Santo Domingo involves a settlement of the republic's debts (scaled down to about $17,000,000) by means of a new loan of $20,000,000. Reports from the island indicate that the Dominican Congress is unwilling to confirm this settlement, but desires to negotiate a loan for only $10,000,000, proposing to defer payment to the largest American creditor, to submit that creditor's claim to some new tribunal and to defer the payment of certain other claims which have been formally adjudicated.——During the past year, Receiver Colton has been striving to suppress smuggling on the Haytian border, and by means of an armed and mounted guard he has been quite successful. Hayti's import duties are less than half of Santo Domingo's, and this smuggling on the border has long been carried on as a regular and profitable business, mainly by Turkish, Italian and Syrian merchants, who employed natives as tools. It very largely reduced Santo Domingo's customs revenue.

Mexico and Central America

Morales and Mora, the two emissaries from Guatemala who assassinated General Barillas in Mexico, have been found guilty by a jury and sentenced to death. Morales confessed that General Lima, a near friend of President Cabrera, had hired him to kill Barillas, paying him $500 for the work. The Government of Guatemala denies this and asserts that Barillas was killed by enemies of Cabrera, their purpose be-

ing to discredit the latter. In many dispatches it is said that there is a reign of terror in Guatemala. Refugees assert that the political opponents of Cabrera are persecuted; that several of them, belonging to prominent families, have been flogged to death, and that others, and even women, have been cruelly tortured in prison. Names are given in these reports. Cabrera has published an official denial, saying that his enemies have organized a campaign of lies. Upon appeal, twelve of the nineteen persons recently sentenced to death in Guatemala for complicity in the plot to assassinate Cabrera have been found guilty and their sentences have been confirmed. One of the two Mexicans was exonerated; the other goes to prison for fifteen years, with the two Italians. Of the twelve to be executed, eleven are Guatemalans and one is a Spaniard. It is still said in Mexico that there will be no war, but relations between Mexico and Guatemala are severely strained, and all the Governors of Mexican States have publicly offered troops to President Diaz. Foreign Minister Gomez, of Nicaragua, who has come to this country, says that President Zelaya has no intention to consolidate the five republics, but seeks only a permanent peace. There is a movement, led by Dr. Francisco Reyes, formerly Salvador's Minister to Mexico, for a federation congress, to be held in Mexico, composed of 150 Central Americans who now reside in Mexico and fifty other delegates appointed by the five republics.

Ireland

Sir Henry Campbell-Bannerman, in outlining the policy of the Government to the House of Commons, announced that the Irish bill has been dropped with regret by the Ministry, but that a bill would be introduced during the present session for the relief of evicted tenants in Ireland by the compulsory purchase of land. The Premier said:

"I believe that the Irish people would have done well to give the details of the measure greater attention than appears to have been the case at the recent convention. But, in view of the announcement of the leader of the Irish party in the House of Commons that he would abide by the decision of the convention, and in view of the unanimous decision of the convention to reject the bill, the Government cannot, of course, go any further with it."

Since the Cabinet has decided against an autumn session it would be necessary to drop the Licensing bill. This would be taken up at the next session, at which also a more comprehensive education bill would be introduced. The Premier announced that the Government intended to pass the army organization bill and some others, explaining:

"When I say 'pass,' I mean 'pass the House of Commons,' as I cannot forecast what will be the action of the House of Lords."

On June 17th or 24th a resolution would be introduced calling for the reform of the House of Lords.——The rejection of the Irish bill has been followed by a great increase of lawlessness and disorder, particularly in Roscommon, Kings and Sligo counties. The peasants resent being confined to small patches of unproductive land while all around them the grass lands are devoted to pasturage. They are, therefore, endeavoring to ruin the grazing industry by driving the cattle from the range. The constabulary in the disturbed districts has been largely increased, but in spite of this it has been found impossible to put a stop to the disorder. The object of the peasants is to make cattle raising unprofitable and unsafe, and so force the selling or leasing of lands for agriculture. The Government has prosecuted 189 persons, but in many cases it has been impossible to secure convictions because of local sympathy with the agitation. Boycotts, assassinations and conflicts with the police are becoming common, as they used to be in years gone by.

India

John Morley, Secretary for State for India, in introducing the Indian budget vigorously defended the action of the Government in arresting and deporting the leading native agitators. He said in conclusion:

"There is a school who say we might wisely walk out of India, leaving India to manage her own affairs better than we can. Anybody who pictures to himself the anarchy and bloody chaos which would follow such withdrawal will shrink from such a position. We are bound to take a different view. We shall face all these mischiefs, difficulties and dangers with a clear conscience, for we know we are not following our own interests, but the interests of these millions committed to us, with sympathy, kindness, firmness and love of justice, and, whether the weather be fair or foul, with courage and a hopeful spirit."

The plague which still rages in India, causing 80,000 deaths a week, is attributed by the Hindu agitators to the British Government, which is accused of killing the people by poisoning the drinking water. A number of natives were found to have been putting harmless balls into the wells, claiming that this was done by order of the Government for the purpose of poisoning the people. The Hindu who started the story, and his thirty-three accomplices, have been sentenced to imprisonment at hard labor for eighteen months or two years. The Government of India is endeavoring to put a stop to the growth of sedition in the educational institutions. The colleges are warned that if the students are allowed to take part in political agitation in such a way as to interfere with the corporate life and educational work of the place, and still more, if such propagandism assumes the form of picketing and open violence, the Government will withdraw from the college, at any rate for a period, the privilege of affiliation with a university and all grants for the support of the school. If professors are found to abuse their positions by inculcating into immature minds of the students doctrines subversive of their respect for authority and calculated to impair their usefulness as citizens, they will be disciplined for dereliction of duty. The chief opponent of the Government on these lines has been Surendranath Banerjee, who, since his dismissal from the Government service, has devoted himself to the cultivation of the Nationalist and anti-British movement, and has organized the students into semi-military corps of volunteers. Among papers of the Hindu lawyer, Lajpat Rai, on his arrest, were found documents indicating that a delegation had been sent to Tokyo to ask the Japanese assistance in a Hindu revolt against British rule. It was given out from London that on the recent visit of Prince Fushimi and Admiral Yamamoto to England, an extension of the Anglo-Japanese treaty was negotiated with Lord Edward Grey, of the British Foreign Affairs. This provides that Japan shall be bound to assist Great Britain with her navy in case the British control of India is attacked by any other power. This is obviously directed against Russia.——British criminal law has received an important modification in the unanimous passage by the House of Commons of a bill establishing a Court of Appeal, which will consist of seven judges of the Kings Bench Division of the High Court of Justice, to be selected and presided over by the Lord Chief Justice of England. This extends the right of appeal, which has been confined to civil cases, to convictions for crime.

French Labor Difficulties

The seamen's strike, which paralyzed the commerce of France for over a week, has come to an end, and more than a hundred steamers which had been held up at various ports for lack of men sailed on June 6th. The seamen have succeeded in demonstrating their power, but have not gained the advance in pensions for which they struck. After prolonged consultations with Minister of Marine Thomson and the Naval Committee of the Chamber of Deputies, the strike committee decided to order the men to return to work and to accept the proposal which M. Thomson had made before the strike—that is, to increase the pensions of seamen in the Naval Reserve from $40.80 to $72, and of officers from $156 to $200 a year. The Minister agreed to abandon the prosecution of deserters and to use his influence with the navigation companies to reinstate all the striking officers and men. Naval vessels had been put in service by the Government for carrying the mails in the Mediterranean, and M. Thomson had announced his intention of manning some of the merchant vessels with naval officers and seamen, and drawing upon the reserves to fill up the crews of the warships. The strikers obeyed the order of their executive officers and returned to work in all the ports of France.——The Government has secured the conviction in the case against the labor leaders, M. Levy, treasurer of the General Federation of Labor, and M. Bousquet, an agitator in the bakers' strike. They were charged with making violent speeches resulting in disorder. The incendiary language they used was reported by the police, and acts of violence by the strikers having followed,

the court held that they were responsible for the actions of those who had put into practice their advice. M. Jaurés, the Socialist leader, spoke in their defense. M. Levy said that he used no more violent language than when he was a collaborator with Clemenceau on his newspapers *Justice* and *Aurore*, but now that Clemenceau was Premier he was treated as an outcast. The jury brought in a verdict of guilty on 24 out of 37 counts, and they were sentenced to imprisonment for two years and a fine of $200. ——The demonstrations of the vine growers in the south of France continue, but maintain their orderly character. At Montpellier, on June 9th, half a million people assembled, spending the day in marching and singing and at night sleeping in the open air. The committee in charge of the movement gave the Government until June 10th to grant relief to the distressed industry, threatening at that time, if nothing was done, that the 1,200 municipal officers of the region would resign or be forced to, and a policy of passive resistance be inaugurated.——The bakers of Paris have increased the price of a four-pound loaf of bread from 16 cents to 17 cents, and a proposition has been made in the Chamber of Deputies to suspend the duties on wheat and flour temporarily.

Russia

The Duma has made another sacrifice to the powers that be for the purpose of continuing in existence. A resolution to instruct the Agrarian Committee to adopt the principle of the compulsory expropriation of land was introduced by the Social Democrats and warmly advocated by them, but was defeated by the Constitutional Democrats and their allies on the Right. The resolution was defeated by a vote of 238 to 191. The resolution in favor of general amnesty for political offenders will probably meet the same fate when it comes to vote, for the Constitutional Democrats are evidently determined to postpone dissolution of the Duma at any cost. Compulsory expropriation and general amnesty were prominent planks in their election platform, but obviously no benefit could come from a declaration in favor of them at present. This conservative action, while it may fail to curry favor with the Government, will certainly cause a break with the radical parties and alienate many of the peasants and workingmen. The Socialists and Revolutionists meeting in London have definitely declared against the Constitutional Democrats and favor breaking up the Duma, possibly also the inauguration of another period of violence and revolt. ——A mutiny of the Fourth Squadron of the Hussars of the guard stationed at the Imperial Palace of Tsarkoe-Selo created some excitement and apprehension, altho it was officially explained that the insubordination had no political motive, but was a revolt against the strict discipline and excessive drill instituted by a new commander.——There has been a considerable increase in the migration to Siberia of Russians intending to stay in that country. During May an average of 8,300 persons passed thru Tchelyabinck every day. A concession for the construction of a railroad thru Siberia and by tunnel under Bering Strait has been recommended by the Council of Ministers and approved by the Emperor. The road will start from the station of Kamsk on the Trans-Siberian Railroad and from the Alaskan end of the tunnel will pass thru Grantley Harbor to connect with the Canadian Pacific Railway.

The China Centenary Missionary Conference

The following report of the Centenary Missionary Conference, at Shanghai is sent us by the Rev. Dr. Courtenay H. Fenn: The throngs have been beyond expectation, and the work accomplisht exceeds the anticipations, perhaps not of the most sanguine, but certainly of the majority of those who have been gathering to celebrate the hundredth year of missionary labor in China, and to open its new century with a program commensurate with its opportunity. Four hundred and twenty duly accredited delegates from all the missions in the Empire, more than 500 visitors from these missions and others interested, and over sixty representatives from foreign missionary societies and church councils in Europe and America were registered. Almost inspiring

introduction to the work of the conference was provided in the news that all the eight Presbyterian and Reformed bodies in China had just united in "The Presbyterian Church of Christ in China," and that the Episcopal bodies were planning to do the same. The Methodists and Baptists have been moved thereby to plan similar unions. This conference was conducted on a new plan, for which there have been few precedents, namely, the previous publication of all the papers and their perusal by delegates to the conference, that the entire time of the sessions might be devoted to the discussion and adoption of sets of resolutions expressing the mind of the missionary body as to the present opportunities, needs, methods and means. In spite of some misgivings, the plan worked admirably, much time being saved, and all resolutions receiving a much more intelligent support or opposition. The resolutions concerning "The Chinese Church," adopted on the first day, would make this conference memorable. With scarcely a dissenting vote, it was decided to form "The Christian Federation of China," to

"foster and encourage the sentiment and practice of union, to organize union effort whenever and wherever possible; to devise and recommend plans whereby the whole field can be worked most efficiently, and with the greatest economy in men and time and money. In planting the Church of Christ on Chinese soil, we desire only to plant one Church, under the sole control of the Lord Jesus Christ, governed by the Word of the Living God, and led by His guiding Spirit. While freely communicating to this Church the knowledge of truth, and the rich historical experience to which older churches have attained, we fully recognize the liberty in Christ of the Chinese Church planted by means of the missions and churches which we represent, in so far as these churches are, by maturity of Christian character and experience fitted to exercise it, and we desire to commit it in faith and hope to the continued safekeeping of its Lord, until the time shall arrive, which we eagerly anticipate, when it shall pass beyond our guidance and control"

Further resolutions urge the Home Churches to recognize the right of the Chinese Churches to organize themselves in accordance with their own views of truth and duty, and to abstain from claiming any permanent right of spiritual or administrative control over them. The Convention fully realized the necessity for the maintenance of the parity of the clergy, foreign and Chinese, lest the missionary should exalt himself above his native brother, or the Chinese minister should either be servilely obsequious, or incessantly irritated. The missionaries are to be the prime movers in asserting the right of the Chinese to independence, instead of trying to put off the evil day when the Chinese shall wrest its acknowledgment from them. The theme for discussion on the third day was "Education," presented by the Rev. F. L. Hanks-Pott, the president of one of the most flourishing Anglo-Chinese colleges. His most radical proposition looked to the establishment of a great Union Christian University, not to supersede the existing colleges, but to continue their work in graduate schools in theology, political economy, law, medicine, agriculture, forestry, etc., for the lack of competent instruction in which China is greatly suffering. This scheme the conference, by a margin of only four votes, failed to endorse, but the scheme is by no means dead. On Thursday the vastly important subject of "Christian Literature" was accorded but half a day. Japanese and secular Chinese presses are flooding the country with non-Christian and anti-Christian books and periodicals, while there are not twenty Christian men giving their whole time to the production of the Christian books so desperately needed both by the Church and for purely evangelistic purposes. Friday was devoted to the medical work; here, again, union was to the fore; and all missions were urged to treat the medical missionary as an evangelist above everything else. The work was well presented by Dr. D. Christy, of Manchuria. Saturday's theme was "The Holy Scriptures, Translation, Interpretation, Study and Use." Reports of the committees of revision, which have completed the New Testament, were received, and new committees appointed to arrange for the revision of the Old Testament. Fuller commentaries, in mandarin as well as wenli, were assigned to another committee, and strong recommendations as to Sunday school literature and Normal classes were referred to a third committee.

A Minister's Salary

BY THE READERS OF THE INDEPENDENT

[On May 16th we published an article entitled, "A Challenge to Christian Laymen," in which the author, who signed himself "The Gadite," complained of the inadequate financial support given to clergymen and warned young men against entering the ministry on that account. "Never once," he said, "in all my twenty years' ministry has the church lived up to its so-called 'temporal contract' with me." In answer to our inquiry whether this was an exceptional case a large number of our readers have written us and from their letters and articles we make the following quotations. In fairness to the writers we should say that we have been obliged to cut down all the contributions and that the paragraphs quoted are not in all cases those that the writers would have made the most prominent. Our object in the selection was to secure as much variety and personal evidence as possible in the limited space.—EDITOR.]

A Minister's Advice to His Son.

As a pastor of Congregational churches, I believe the Gadite's case is not so exceptional as to be extraordinary, and that his conclusions are justified. I have been in my present pastorate ten years, and have expended more than $3,000 more than I have received from the Church as salary, including missionary aid. In another pastorate I went several hundred dollars in debt. A number of ministers have told me at various times that they could not force their stipends to cover their expenses. Yesterday I was talking with a member of the supply committee of a church in a city of 30,000 population, a church with a big "manse," where at least one hired girl is needed. I asked, "What salary do you propose to pay the new man, when you get him?" "The same as we have paid, one thousand and house." "It is not enough for the place," I answered. "There is this about it," was the reply, "we can pay that now, and if the new man can work up a larger income, as he ought to be able to do, he can have it to the extent of fifteen hundred or so. A good, smart man ought to be able to increase the paying constituency of the church." The former pastor of that church, who is a man with some independent means, and has a wife similarly situated, told me, "It cost us, all told, $500 a year to keep a hired girl. That was one-half of the cash salary!"

I have a son, a lad in his third year in the high school. I have discouraged any talk about the ministry on his part. I think he is safely headed toward a useful and honorable profession—neither medicine or law—and shall try to keep him steady in the track until he has secured a position in the world that will insure him a comfortable livelihood under any ordinary circumstances. If then he wishes to take up with "preaching on the side," he can do so with safety, and I shall not be sorry to have him.

PASTOR.

A Woman's Experience.

A few years ago I married the pastor of an orthodox Protestant church, in the City of Brooklyn, N. Y. My husband received $800 a year. The church wanted us to keep house, "it would be so much better for the people." So we hired a small house for $27 a month. This we had to furnish on the instalment plan.

I had always been interested in church work. Now I entered on the work in my own especial church with great enthusiasm. I became a member of the Young People's Society, whose meetings I often led; I became a teacher in the Sunday-school; I was expected to be an active worker in the Women's Society, over whose meetings I was expected also to be always ready to preside. At home I had all of my own work to do, but must be ready to receive callers at any time. I helped my husband in his study work. He needed an amanuensis; we could not afford it. I needed help in the kitchen; we could not afford it.

Meantime the church was growing; over 300 in the Sunday-school. Behind the scenes my health was breaking down; I could not stand the strain. I sacrificed my motherhood, and I love children, because I saw that in order to do all that was required of me, the church and my husband needed all of my time. This church had not much wealth, tho it was a branch of a church with plenty of money, and our denomination, whose officers knew us personally, counted many millionaires among its adherents. This chapter ended with my husband's resignation, leaving the city for a country church, and my illness for three months.

Oh, what a difference a few hundred dollars would have made! But they tell us Our Master laid down His life for His work, and are we better than our Lord?

A MINISTER'S WIFE.

The Lord Will Provide.

With me, entering the ministry was somewhat like a soldier going to war. I expected hardship and combat and was not disappointed. Everything that came my way was accepted as either sent directly or permitted of God. I was criticised, ostracised, slandered and hated by some; I was praised, supported, prayed for, and loved by others. I passed thru it all with a clear conscience. I sought to do good to all, but favor of none.

There are two verses of Scripture that have entered largely into my life and experience. The first one is this:

"No man taketh this honor unto himself, but he that is called of God, as was Aaron." —Hebrews 5:7.

I knew that God had called me to serve Him in preaching the Gospel. I did not choose the ministry as a profession, neither did I object or rebel when He called me to the work. Then I settled down on this verse:

"My God shall supply all your need."—Philippians 4:19.

I knew I was working for God, and could not "hire out" for a salary to any congregation, and have never done so. Thru an experience of twelve years I can say that the above promise has been verified to me and my family a thousand times. I have never actually needed a thing that was not providentially supplied. Here are a few instances:

While at J—— I was called away to a meeting some forty miles distant. I had very little money and did not feel disposed to spend it for railroad fare. However, after due consideration I felt it was my duty to go. I gave my wife part of what money I had and departed, promising to return home on Saturday. Subsequently I found it would be impossible to get home at the end of the week. I knew my family would be in need before Monday. After prayer they were committed to the care of Him whom I served. On my return home Monday afternoon this was what my wife told me:

"Saturday I spent the last cent. Sunday evening we ate all the food we had in the house. We prayed and committed ourselves to God. Monday morning we found an envelope under the kitchen door on which was written: 'Mrs. ———, in Jesus name.' Inside was a silver dollar. We had breakfast and dinner and praised God."

While at C——, I found myself one day with but one copper coin in my possession. I was preparing a sermon for the Sabbath. I stopped in the midst of my work, looked out over the busy street and beyond to the distant hills. Then I prayed:

"O, Lord, send me a dollar, and send it quickly!"

My room was on the third floor; the window was open, and within fifteen minutes from the time my request was made I heard a loud knock on the front door downstairs. I listened, and this is what I heard:

"Mrs. ——, my mother sent up a dollar for the preacher." A few moments later it was delivered to me.

When I next saw the woman who had sent me the money I asked for an explanation.

"Well," she said, "I was at work in the kitchen. The Lord told me to send you a dollar, and send it quickly. I called my boy and hurried him off with the money. That's all."

While at H——, attending a meeting, in company with an evangelist, I found myself one morning without a cent. While writing a letter to my wife these words went up out of my heart:

"O, Lord, open up the way for me to get this letter in the mail."

Ten minutes later the evangelist came downstairs, entered the room, approached the table at which I was writing and laid ten cents on the paper before me, saying:

"This is for postage stamps."

I thanked God, finished my letter and mailed it.

One day at C——, I needed $2 before starting for my next appointment, twenty miles up the river. In my room I prayed, asking that the money be provided at once. Then I took up my grip and started downstairs. At the foot of the stairway stood a young woman, her hand thrust thru the railing, holding out a $2 bill. She said:

"The Lord told me to give this to you."

Months afterward I learned that she had given me all the money she had, not knowing where her next cent was coming from.

Called on to supply the pulpit of a church at D——, for the Sabbath, I prayed about it. I felt certain it was my duty to go. Nothing was said regarding money. I preached at D—— Sunday morning and evening. Before retiring that night the elder with whom I was stopping, said to me:

"Here is what we received in the offerings today. It is a little short of paying your railroad fare, but I will get the balance in the morning."

"Very well, I never trouble about money matters. The Lord will provide. He always does."

The next morning he handed me a dollar. Returning home in the train I figured up the expense of the trip and found it to be $6.47. This was the exact amount I received.

While living at M——, here are two experiences that came our way:

One day we found we had everything necessary for dinner with the exception of bread. I had no money. This was particularly trying to my wife. I remarked, playfully:

"Well, here's where the old Book goes to pieces. You get dinner and I'll see about the bread." I went to my room and repeated the promise: "My God shall supply all your need," and then coupled it with this: "The Scriptures cannot be broken."

In about twenty minutes I returned to the kitchen and waited while dinner was prepared. When the meal was placed upon the table we sat down and "said grace." Just then there was a knock on the door.

"There's your bread," I said to my wife. When the door was opened a little girl handed in a basket containing several jars of preserved fruit and *a big loaf of bread!*

At another time, during very cold weather, we were short of wood. I had no money with which to buy any. Before retiring one night my wife and I prayed about the matter. Next morning I was awakened by my wife, saying:

"Wake up; somebody's delivering us a load of wood."

A farmer living eight miles back in the country had been awakened from his sleep about 2 o'clock that morning and was told

to deliver a load of wood at my house as soon as possible. He loaded his sled from his own woodpile, left home at 5 o'clock, and reached us before we were out of bed.

While preaching for fourteen days at a mission in New York City, here was my experience:

I found my expenses would be about $5 a week. I committed the matter to the Lord and said nothing to any one about money. After the first night's meeting a man interested in the work, came to me, saying:

"Here is $5 for your expenses this week."

One week later he came to me again with a like amount. This left two day's expenses to be provided for. After the service on the last evening a young man handed me a dollar, saying:

"This is toward your expenses."

This paid for the two days, as I had eaten several meals at the home of friends. Then I was given $10 "for yourself." I received, without the asking, or taking a collection $22. At this time I was working at my trade, earning a living for my family.

When I needed money for rent it was brought to me by fellow Christians, "for rent"; when I needed shoes, the money was given me with the information that it was "for shoes." In this providential manner, without salary, subscription, collections or begging; without telling a single human being on earth my needs, even refusing to tell when solicited to do so by people worth thousands, these words have always been fulfilled:

"My God shall supply all your need."

The Christian Church today is cursed and disgraced the world over by beggary and unholy financial arrangements. This would not be the case if ministers could trust God. The ministry is responsible. "Like priest, like people!" W. LINCOLN PHILLIPS.

ROSELLE, N. J.

The Gadite's Case Exceptional.

I have been a member of the Presbyterian Church over forty years, have been an Elder over twenty-five years, have been sent to Presbytery many times and to the General Assembly once. I have never known an instance when a Presbyterian minister was not paid his salary in full, and paid willingly and cheerfully, not compelling him to "crawl up to his lordly parishioners like a belabored hound begging a bone." This town has a population of a little less than 4,000. We have six churches: Methodist, Baptist, Congregational, Presbyterian and two Lutheran. The first four named pay their pastors $1,000 a year each and furnish good parsonages; this enables the ministers to live fully as well or better than the average members. The Presbyterian Church pay $500 a year for the support of a missionary in China besides contributes to all the benevolences of the church. We have no millionaires or very rich men. We are just about an average middle-class community, no better than thousands of other towns in our country, and to young men desirous of working in the Lord's Vineyard we can see no reason why they should have any fear that they will not be well taken care of.

McPHERSON, KAN. F. E. BARBER.

As a Tract.

I believe that the Gadite's article should be placed in the hands of Christian laymen. I would suggest that you print it in pamphlet form to be sold at a nominal price. I think the ministers, if they know of the article, will see to it that it has a liberal distribution. I for one would like 100 copies. It is timely and calculated to change the attitude of a rather inconsiderate and thoughtless laity.

GEORGE R. BRAUER.

SETAUKET, L. I.

Less Than Six Per Cent.

I hardly overestimate when I say that my education, including music and elocution, has cost in the neighborhood of $3,500. Indirectly you may add possibly $3,500 more; for judging from the salaries my playmates are earning, I also could have earned such a sum during these long college years. Opportunities to do so I had in abundance. I graduated with a very high percentage and always ranked among the best in my class. So far I have been quite successful at my present charge. I have had several opportunities thrust at me to make a change for the better. I don't say this for the purpose of boasting! God forbid that I should do so! I simply mention these facts to show that I am by no means a failure, that I need not drink the lees after others have quaffed the wine. I am still at my first charge, altho I have had several opportunities to make a change for the better. Still I chose to remain solely for the interests of my congregation, thus sacrificing my own interests; for I believe that a minister should at all times prefer the good of his charge to his own. Now what do you think I receive as a salary? Many of my friends with hardly half the training I have received in other vocations are either already earning or stand in a good way of earning $1,000 or more a year. I am getting the princely salary of $400 a year, $8 a week. Foreigners working on the railroad and in the quarries nearby with pick and shovel would strike if they received less than $1.50 a day. They work six days a week and ten hours a day, while my work is hardly ever done. My education, directly and indirectly, represents an outlay of $7,000. I am receiving $400 a year, not even the interest on the capital invested at 6 per cent. All my labor I am actually giving them for nothing. Some of my members will pay $2 to $5 for a single doctor's visit, and yet have the hardihood to offer me $2 for six months' instruction. My members are not what you might term wealthy; still they are well to do. If I calculate their total earning capacity, or better, their actual earnings, at the very lowest estimate, I find that they are barely paying 1⅓ per cent. of their income for church purposes. What does the author of the "Challenge" think of such a state of affairs? As to buying a horse and a carriage, which, by the way, I also ought to have to make my pas

toral calls, why I dare not even think of such a thing! If I had to pay $300 for the horse and carriage, I should still have $100 to feed, clothe and otherwise maintain myself for a whole year. I am now as yet on the very threshold of my career and still have a good deal to learn. I have no access to even a fair library. I surely ought to be placed in a position to buy at least the books necessary to continue my studies and to keep abreast of the times, but just at present I dare not buy a single book. I am not married and have only myself to support. In fact, I experience no little difficulty, as it is, to make ends meet.

ANOTHER CHALLENGER OF THE LAITY.

A Farmer's Reply.

There is no doubt that the nudge offered by "The Gadite" to Christian laymen is timely; for most of us in the pews need the criticism. But the fact remains that the rank and file of the Christian ministers are paid all they are worth, and in many cases more than they could command in the commercial world.

If "The Gadite" is a man of talents as THE INDEPENDENT states in its introduction to his article; and if, as he says of himself, he is forty years old and preaching in a city at $1,000 per year, there is something wrong with the man. And yet again, if, as he says of himself, he has so developed the sentimental and sympathetic side of his character as to unfit him for looking into life's ordinary occupations, his one-sided development suggests the cause of his not getting on better in the world. It is expected, of course, that the burden of every man's thought will be along the line of his specialty; but if I, as a farmer, become so engrossed in my hogs and cattle and sheep as to unfit me for thought of and participation in the church and school and other institutional life, my success and usefulness as a member of society will have narrow limitations.

I have acquaintances among the preachers of my church and of other churches who own farms of from 40 to 160 acres, paid for out of their salaries and rents; and others who own business houses and dwelling houses, and other property paid for in the same way. And besides many of them have paid the way of sons and daughters thru college.

Such statements as these may mean nothing to the Gadites who spend $1,800 while receiving a salary of $1,000 per year. But they serve to point the application that ordinary preachers of balance do have a way of succeeding in the ordinary way, without pretending to be what they are not

WILLIAM E. ASHCROFT.

SOUTH WHITLEY, IND.

The Minister's Budget.

My mother supplied us boys with any grit and gumption that we may have and also contributed largely to the bread and butter fund My financial genius was awakened when I solved the problem of living upon 15 cents a day during the first year in college. When, after college, seminary and university, I handed in my thesis for the degree of M. A., I concluded that my book learning was the least important part of my equipment. I have received, in four churches, the salaries, $500, $700, $900 and $1,100, the latter being my present income. I have saved from all of them, and still live to tell the tale. I owe no man, have a 600-volume library, support a membership in the Masons and Odd Fellows, carry $2,500 insurance, cherish a bit in the bank, have a wife and three children, live in comfort, and am just turned thirty-one, having no fault to find with church finances except that I wish every dollar came from the spontaneous gifts of the people.

How have I managed? I begin backwards. Two items are set down as irrevocable: put $1 in the bank each week, meet the life insurance premiums. A third is more flexible: give $50 a year to the church. There is left the sum of $900 for living expenses. Last year it was $100 saved instead of $52. I buy only such things as we have actual use for and do not pay extra prices for names of goods. I cut out a large percentage of outside calls—conventions, conferences, complimentary services, etc. They all take money and do little good. I live in a house that suits my means. Whether it suits other people is a matter of secondary importance. And right here I wish to say that when it has been necessary to make any explanation at all, my people have respected my point of view. If they want me to live better, let them pay more salary. If they don't like my ways, they can get some one else in my place as soon as they please. Those who want to pay for the frills and flounces of life can do so; but give me plain food, neat but plain clothes, a snug little house where rent is moderate, and I am content. Others may do the straining after effect. I am generally so busy with my books, preaching and parish work that I do not bother with much else.

A few details may be suggestive in regard to the expenditure of the $900: $200 for rent, $300 for table, $100 for clothes, $50 for fuel, $30 for books, $50 for railroad fares, $25 for doctors' bills, $145 for miscellaneous fund. My mental account is as follows: I am as independent as other men, live as well as the average man, do not fret over what I can't have, let the work and perplexities go into the past with the close of day; and so comes health and content.

A LEVITE.

The Evils of Competition.

As a layman and business man, serving in an executive capacity in an enterprise founded by myself without any capital other than reasonably good health and the ability to endure and struggle, I feel not only a sympathy for the struggles of Gadite, but believe that I can diagnose at least a part of the ailments of which he complains.

The Protestant Church, divided into countless sects and schisms, is operating on the competitive basis, which always means the survival of the fittest and the languishing or destruction of the remainder. The Church is very largely what the ministry makes it, and

so long as the universally understood and accepted principles of Christianity are held in subservience to the petty details of denominational differences; or so long as continues an ambition for the seats in the chief places, which are multiplied by a multiplication of the schisms, so long will be delayed the answer to our Master's prayer, "That they may be one, as we are," and so long will the cause of Christ suffer, and incidentally those connected with it.

If, in theological seminaries and ministerial conventions, more of the time which is now spent upon predestination, the real presence, infant baptism and the like, were devoted to the discussion of ways and means of reaching the sinner; if the energy and money which is spent by competitive churches in building rival edifices upon opposite corners were given to the winning of souls, we would have fewer churches but more Christians, perhaps fewer ministers, but the power of each would be multiplied, and the salary question would take care of itself. Our own city has seventy-five churches, many of which are poorly attended and continually struggling with the problem of making ends meet. Twenty-five would be ample to accommodate every one in the city. This would mean, on the basis of the same number of pastors, that the most capable third could be chosen as pastors-in-chief, the middle third could assist, and the bottom third, who are sacrificing most for the Lord, could enter the lucrative professions, and if successful there, contribute liberally of their substance to the work which does not now prosper under them. Comparatively few men are capable of leadership, and many unsuccessful pastors could become valuable assistants, and more effective organizations thus formed. Furthermore, if twenty-five vigorous churches could supplant seventy-five which are mainly struggling ones, there would be no financial problem, and the work of the Lord would prosper as never before. The ministers do not work enough for this end.

If the ministers will preach upon the Christian virtues; preach kindly and tactfully, yet without "trimming," preach just what they feel their congregations require and need, we will not have such selfish and worldly laymen, and the ministers will be properly cared for. "Once I was young and now I am old, yet have I not seen the righteous forsaken, nor his seed begging bread." A CRITIC.

Is the Gadite to Blame?

The first impression I received from the story of the writer's experience was one of surprise. I am surprised that Gadite does not see that his own narrative convicts him of poor business methods. $550 per year is a very small remuneration for any man, pitifully small for a *trained* man in any calling, and scandalously so for a minister compelled to keep a horse. But if the expenditure of $300 out of this pittance for the horse and outfit is a sample of the rest of our friend's financiering it is not strange that he did not get along on other incomes. One is compelled to ask also what conceivable conditions could oblige a popular pastor of well-to-do Christian people to borrow $100 of a Hebrew at the equivalent of 70 per cent. annual interest. Is that "business?" The question also arises, how is it that in twenty years of successful pastoral service as he describes, he did not put some one of his charges in such orderly condition that it would not be possible for "temporal contracts" to be violated? I am forced to conclude that the pastor himself has been in some measure responsible for his financial difficulties.

In the fifteen years of my experience I have not, at any time, had reason to feel that my work as a minister has been insufficiently rewarded from the point of view of physical support. It is true that many laymen have not done their part, but the laity as a whole have done all they have promised, and more. In all my experience they have not come short in a single "temporal contract," and many they have more than fulfilled. And while my experience is not that of "The Gadite," it is as genuine as his, and I do not know why it is not as significant. I can not therefore permit all laymen to lie under the indictment which your correspondent brings. A PASTOR.

NEW YORK CITY.

A Prophecy.

"A Challenge to Christian Laymen," is a voice from the prison mentioned in Isa. xxiv. 22. Clergymen, like the rest of us, are fulfilling prophecy. Their "many days" are nearly up; they shall be visited.

WASHINGTON, D. C. R. G. SOMERVILLE.

The Question of the Hired Girl.

A man of the attainments of the Gadite, who makes the assertion that a Catholic hired girl is compelled to contribute from 20 to 30 per cent. of her income to her church, such a man's statement I say should not be taken seriously.

A BUSINESS MAN.

Undeterred.

The article, "A Challenge to Christian Laymen," in a recent number of THE INDEPENDENT, has attracted my attention. It is but natural that it should, for I am studying for the clergy, intending to leave the ranks of the laity to enter the order of those ministering to them. It is because of this fact that I feel that I may have some contribution on this matter, from the viewpoint of the theological student, who has the whole before him as a matter of life-history.

Four years ago, when I had reached what I considered the years of discretion (I was sixteen), I determined upon the ministry as my fittest corner in life's battlefield. Since that time, I have molded my affairs with that in view, electing such studies as commended themselves for breadth of view and knowledge of all the nature and needs of my fellow men, the laity: anthropology, sociology, economics, psychology and philosophy. Now I am a senior in this great Western university, about to come to the parting of the ways. I see my classmates and fraternity brothers preparing

for a life of financial profit, a life in which they can honestly and honorably aid their fellows and contribute to the world's work and yet maintain themselves in ease and comfort. And I—I, too, am preparing to leave my alma mater—for what? For five more years of preparatory work, of slaving study in a theological seminary where I hope to acquire a B.D. and a Ph.D. So far the prospect is good, for I am drawn to the thoughts of other men and to the tracing of the intricacies of others' *Weltanschauung*. But what is to become of me after I leave this other school, with an education costing at least $3,500 since grammar-school days? Am I going to be able to achieve my purpose of maximum utility: the helping of my fellows to better living and clearer knowledge?

Into everything *must* enter the pecuniary motive, which is not necessarily the mercenary motive; for if one completely disregards self and selfish things, must he not be judged still by what he accomplishes? Can thorny ground produce good fruit?

What am I, as a student of the Gospel, to expect? Must I fail, despite my own self-sacrifice, in my endeavors to fulfill to the utmost my capabilities? My duty to my parishioners will require that I maintain a style suitable to the dignified calling of the church; but will the duty of my parish be to see to it that I have the means wherewith to accomplish this?

For me the worst feature of the whole affair is that I must bring hardship upon the one of all this world I would fain protect. For I am in love, with all youth's hopes and fears, but with mighty limited prospects. Must the little lady who faces the future fearlessly and gladly, who thinks she knows the full extent of the sacrifices entailed by the life she consents to lead—must she know the bitter pinch of poverty; she who could have far, far better if she but would? Must I, in my attempts to relieve the burdens of others, be the cause of new burdens being heaped on her fragile shoulders?

All this and more, much more, stares at me from the future which I have chosen; and tho there is no regret and no desire to turn back, I wonder if I, too, must feel the cruel weight of an unnecessary cross carelessly piled on by a heedless laity.

A Theological Student.

From a Father.

I have been especially interested in the article, "A Challenge to Christian Laymen," for the reason that I have a son now attending one of our State universities, who has determined upon the ministry as his life work. I am sending the article to him, not that I would have him dissuaded from his course by this or any opposing interests, as they might be presented, as I think he thoroly understands the situation, and realizes, to the extent of his ability, that he is not to expect financial advantage to accrue, but that he may not overlook these realities as they exist.

My idea is that this is not an unusual case, that many of a similar nature exist, and there would be more but for the fact that all are not so thoroly consecrated to their obligation, so obedient to the conception of their duty, but take advantage of political means, possibly, to advance their personal interests. "The absence of conditions favorable to independence of thought, speech, action," is full of meaning and portrays the more unfortunate side of the real situation.

O. P. Williams.

Indianapolis, Ind.

The Minister and the Mechanic.

I am a skilled workman in a good mechanical trade; am about the Gadite's age, and may be his equal in native mental endowment, tho less favored by education. And the flatteries I have heard as to my skill are probably no less sincere (if less beautifully engrossed) than those he has received from the schools. Circumstances led me to take up my final life-work at a maturer age than he; so if I was glad to begin work at a dollar a day it was not because of my youth. Very slowly the dollar grew to two, and now I have a third, thanks to general prosperity and a great local boom. In common with the great mass of mechanical workers, my workday has been ten hours. My yearly earnings have been from $200 to $350, and last year $500. At my trade a man can seldom make 200 days' wages in a year. But it is a noble trade, and in it I have prospered and saved money. I own my home and have a wife who does not make it cheaper to board than to keep house. And but for broken health I should from henceforth feel myself very independent.

There is an important difference between salary and wages which salaried men are apt to overlook. The pastor of a large church is a very busy man and cannot go fishing every fine day. But when necessity or pleasure does take him out of town for a day his salary goes right on; if he is sick it goes on; if he gets a fortnight's vacation or the church is closed for repairs his pay continues. But when the mechanic who works by the whistle quits work for an hour, for sickness, or to visit with a friend, to attend a convention, or because it rains, or there is a shortage of material, or for whatever cause, there is a clean-cut tangible hole in his pay-check to correspond.

Now, to return to the preachers for a counter-illustration: The church of which I am an insignificant member has no very rich people in it. There are no *very* rich men in all our little city. We are business and professional men, mechanics, a fair sprinkling of unskilled workingmen, and of farmers from the surrounding country. Very few of its nearly a thousand members has an income equal to the pastor's salary, which is $1,600. For some years, at least, we have met our bills promptly. Our worthy pastor is a man of mediocre intellect, a graduate twenty-five years ago from a cheap Western college, and he honors his alma mater by adorning his sermons with the identical science and philosophy that he

learned in her classrooms; a man who has risen to his present eminence by hard, faithful service. The job is no sinecure, and the salary involves no danger of accumulating a bloated fortune. He did not enter the ministry from mercenary motives, but I wonder in what secular calling he would have fared better. The salaries paid by the larger churches in our villages and smaller cities compares very well with those of the school superintendents in the same towns. Now these school positions call for as much education and as great talent and involve as hard work and as grave responsibility as the large pastorates, and like them, are commonly worked up to by a long apprenticeship in lesser and scantily-paid positions.

And as to churches not paying salaries promptly: The preacher who is doing mission work among the poor or serves struggling churches on the frontiers of civilization may well feel, with Paul, a Christian delicacy about pressing his just financial claims. And if he have not, like the Master, meat to eat that the world knows not of, he may get hungry and discouraged. But in a rich city church, such as the Gadite tells of having served, there is no sense in a preacher going without bread or carfare because his salary is overdue. I think those millionaire deacons would have had more respect for him had he firmly insisted upon prompt settlements. If their attachments to their church and pastor was so weak it wouldn't stand that much of a jolt, I say the sooner the combination were shaken to pieces, the better for all concerned.

A CARPENTER.

A Parallel—With a Difference.

My father was a Methodist preacher in Michigan. His period of service covered some forty years ending in 1902. Unlike the "Gadite's" father, he was unencumbered with titles or distinctions, but was just a plain Methodist preacher in towns of 2,000 or less population. His salary was never more than a $1,000, and in each church but one part of this was house rent, reckoned at $100 or at $150. Furthermore, a considerable portion of his pay came in kind—hay, wood, produce, etc. At one place, the wife of a well-to-do farmer wished my mother to take their "quarterage" in "fry-fat." "Fry-fat" was what the good woman had saved from fried and roast meats, and its usefulness was in frying potatoes, etc. My mother's cook-book did not call for "fry-fat." This was the only offering in kind that was not accepted as the equivalent of cash!

This salary, small as it was, was never paid in full till the night before my father started for the annual conference. My most impressible memories are of the annual struggles of the official board, who always met at our house, to stretch the receipts, reckoned at their fullest value, to the dimensions of the salary.

All of these forty years my father kept a horse: often a speedy and once a first prize animal. Oftener than otherwise he had an out appointment. The Methodist Church, in nearly every town where we lived, was by all odds the leading church. The congregations were from 300 to 600 people. In this period my father paid my way, almost entirely thru six years at the State university and thru the first year of a divinity school course. He had one weakness: a desire to help young men, who wanted to go to school, to advantages which had been denied him. And I know of more than a score of such who owed their college education, in part, to his financial aid. Beside this, nephews knew the way to the uncle's pocketbook and kept the path well trodden.

My father was a great student. When he died his library contained some 2,500 volumes. He was far from libraries and he took at one time more than twenty papers and magazines, of which THE INDEPENDENT was always one.

He never had any other financial income but his salary, except about $2,000 from his father's estate and a like amount of life insurance, when my mother died.

In 1880 he lost his entire savings, which, with interest compounded according to the terms of the investment, amounted then to nearly $15,000. When he died he left an estate of $8,000, on which, for two or three years, he had lived in retirement.

The Gadite's biography and this of mine match in all but the results, and the differing results show what different men make out of the same conditions. There were plenty of men, with conditions as good as my father's, who went whining in absolute poverty to their graves. Who was to blame for their poverty? Surety not the laymen—at least not entirely.

Now, I am not of those who think ministers are paid enough. My salary is paid once a month, in cash, with the precision of a clock. It is 40 per cent. greater than my father's ever was. I am like most of my neighbors in our denomination in the amount of my income, and in its prompt payment I consider that, relatively to the times, I am about as well off as my father was. And I have the further advantage of having learned not to expect the impossible interest rates that prevailed after the war and to beware of anything that proposes unusual returns. So that, all considered, I do not see why, with health, I may not lay up enough to cover my old age, as he did—*provided* I will adapt my living to the economy possible in this age, as he did to that of his generation. If *he* lived in a cheaper day in some ways, I am certainly saved expenses that he could not avoid—for books and papers, for instance.

I am fully aware that the conditions that surround me are not widely prevalent. But I do not believe that their remedy lies in appeals to laymen! Ministers will never be better paid till they demand it. Churches are always going to buy good preaching at the market price. And so long as there is no *honor* among ministers in the matter of competition and price-cutting the market price will continue low. If a union of carpenters is possible, why not a union of the disciples of the Carpenter's Son?

MIDDLEBORO, MASS. G. E. MACILWAIN.

French Presidential Shooting Parties

BY VICTOR DU BLED

[The author of the following article is a writer of books and a contributor to the leading French periodicals. He is also a sportsman and has taken part in some of the shooting parties described below.—EDITOR.]

THE lover of antitheses, of social psychology, of historical paradoxes, would find much material for the gratification of his tastes in two books which lie before me as I write. The author of one of these volumes is President Roosevelt, and the other was edited by M. Louis Leddet, of the French Forestry Department, under the direction of the late President Félix Faure. In the first, Mr. Roosevelt tells with verve and a charming simplicity his cynegetic souvenirs when he was a ranchman; what rough times he had chasing the buffalo, the moose, the bear, the deer, the wolf and the cougar; what hard and often dangerous tramps he took, where the hunter and the wild beast vied with each other in deeds of strength and endurance. The tales of Fenimore Cooper are lived over again.

In the second book, entitled "Chasses de Rambouillet," the historiographer goes back to the earliest times of hunting at Rambouillet, and describes the famous venatic events of that charming wood, where kings, emperors, great noblemen and democratic presidents have pursued the fleeing game, and where today the sport has taken on the form so dear to the Parisian hunter—the battue, a hygienic sort of pastime, which is not fatiguing, rather tame, which affords considerable exercise in a short space of time, but where no risk is run, where there is no strain on the brain, where the strategy and tactics of a great wild hunting expedition are unknown, where, in a word, all that is required of the gentle sportsman is some walking power and a fairly good aim.

From these two books can be drawn a bit of philosophy, a whole race theory, or at least the confirmation of a theory. The President's volume illustrates the American, the Anglo-Saxon, race, the race of

THE KING OF ITALY HUNTING AT RAMBOUILLET.

PRESIDENT LOUBET AT THE RAMBOUILLET HUNT, OCTOBER 14TH-18TH, 1908.

initiative, loving toil for toil's sake, playing with difficulties, going forth to meet obstacles whatsoever they may be, bending the will to attain an end, and employing every sort of quality to attain it, caring little for titles and etiquet, and endowed with a good amount of common sense, which prevents seeking the philosopher's stone or trying to square the circle. On the other hand, the Latin race, the Frenchman, used for so many years to a centralized system of government, more enamored of authority than of liberty, apt to sacrifice the substantial reality to the shadowy ideal, loving ceremonies, pomp and etiquet—but the parallel could be continued indefinitely, and would be made up of the false and the true, as is the case with all parallels. But we have in France many strong, not too poetic, well balanced characters—Anglo-Saxon Frenchmen; and, if one looks about a little, I imagine one will find not a few Americans with French characteristics; for the different peoples resemble one another more than we are apt to admit. For instance, we have in France other kinds of shooting than that known as battue; and as the hunting of the buffalo, the bear and the moose is rapidly disappearing in the United States, it is highly probable that in another half, or, it may be, another quarter of a century, the hunting on the other side of the Atlantic will not differ essentially from that which now prevails in our old Europe, and the Nimrods of France, England and America will be much the same.

The official shooting parties of the past in France were very little like those of today. The animals hunted were chiefly deer, wolves and wild boars. The huntsmen were generally attired in linen costumes. The art of falconry was then at its hight. There were birds of prey for each kind of game—the tiercelet for the partridge, the lanner for the fox, and the gerfalcon for the heron. The venary establishments of our kings were conducted on a most lavish scale. Henry IV, for instance, had a master of the hounds, a grand master of the wolf-

hounds, a pack of sixty deer-hounds, a pack of forty mastiffs and harriers for boar hunting, a hundred archers, a grand falconer having under his orders ten lieutenants, each charged with a special cast of hawks, etc. Sully estimated that this hunting establishment cost some 1,200,000 francs a year. But the expense was not the only feature in which the royal chase was different from those of the presidents of the third Republic. Some of our kings did almost nothing else than scour the state forests for game. Louis XV, for instance, hunted nearly every day, much to the disgust of many of those who had to follow him. Thus, on one occasion, in the Fontainebleau forest, when the day's work had been especially tiring, the King called Lansmate, his head whipper-in, and said to him: "Are the dogs used up?" "Yes, sire, several are." "And is it the same with the horses?" "Yes, sire, they are quite broken down." "Well, we will hunt again tomorrow." Lansmate made no reply. "Did you hear what I said, Lansmate? We will hunt again tomorrow." "Yes, sire, I heard the first time. But it goes against the grain, that I am always asked whether the dogs and horses are tired, but nothing is said about the men!" But the hunt came off, nevertheless, on the morrow.

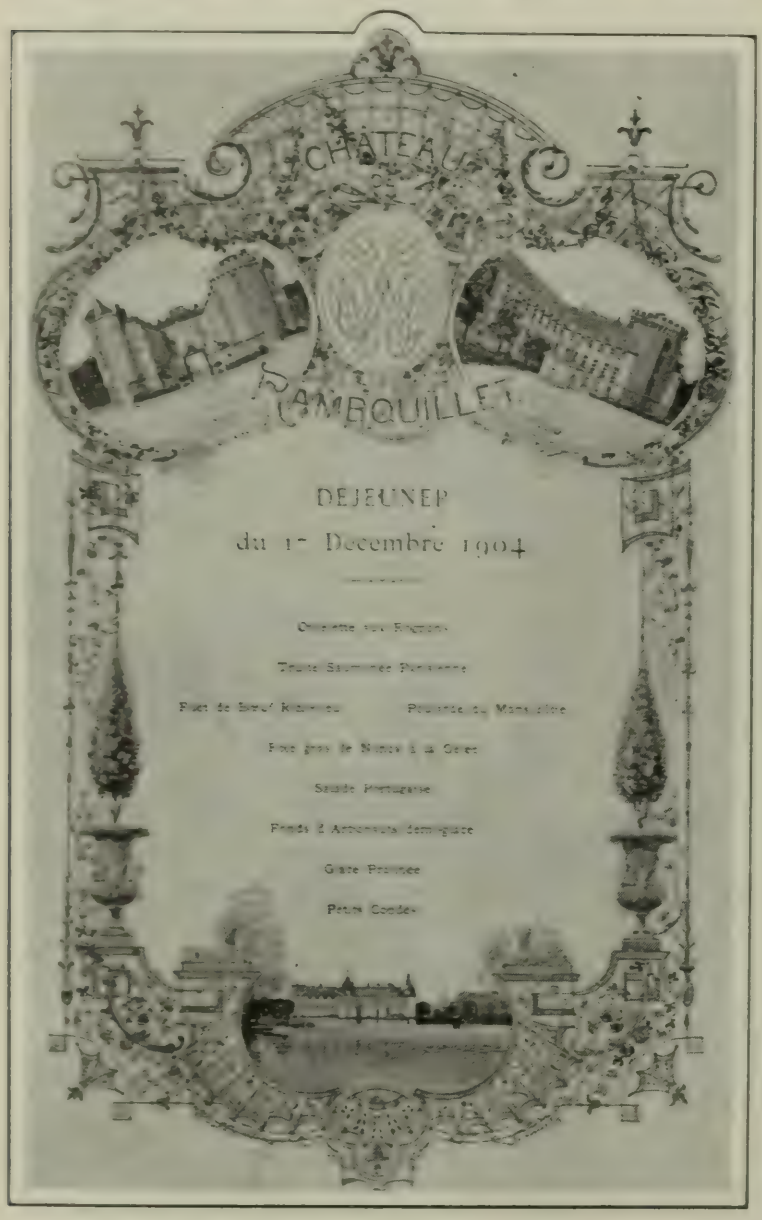
Such are some of the characteristics of the royal hunt of France, magnificence, a large expenditure of money, a crowd of officers, a retinue of servitors, a sport regarded as an art and a science which required careful study, a sort of duty which demanded much leisure and many princely residences properly fitted up to permit indulging in this costly pastime.

How different all this is from the official hunting parties of the third Republic, which today occur in but two places —Rambouillet and Marly, President Fallières having abandoned the Compiègne forest, which his predecessor, M. Loubet, had restored to favor in this particular. They present none of the hardships of the old royal hunts, and much less the still tougher work that President Roosevelt rejoices in under the shadow of the Rocky Mountains. In these French presidential shooting parties, the game is beaten up by the forest guards and stands almost still to be killed, so that it is rather a balsamic sport, which requires no special training and in which very little art or science is displayed. And great simplicity is also observed in the presidential chase. An army officer and two or three forest inspectors fill the post of the master of the hounds, the captains and lieutenants without number of the olden time. They have under their orders, some thirty or more forest guards, almost all of whom are retired non-commissioned officers. This little body of aides suffices to carry out successfully and smoothly the parties given by the Elysée to the French and foreign official world. Under President Fallières, Major Lasson may be called the master of the hounds.

In the annual state budget of France, 50,000 francs is set aside to cover the expenses of these presidential hunts, which sum is mainly consumed in raising game. The forest guards are also paid out of it. These guards, by the way, form quite an important feature of the presidential hunting system. They have a house for themselves and family, generally pleasantly situated in the forest. Besides their regular salary, they get not a little money from "pourboires," gratuities given them by the guests of the President, a custom which many rightfully think the President ought to abolish. It is the habit to give from ten to twenty francs, that is, from two to four dollars, to the guard who carries your gun and cartridges during the break between each battue. Sovereigns and princes leave a much larger sum with these men. The Prince of Monaco, on one occasion, handed the head guard 400 francs. Each guard puts what he gets in a common fund, and at the end of the season, they divide the total among them, the head guard alone having the right to claim two shares.

Rambouillet is the chief hunting-ground of the French Presidents. There are some 2,000 acres, with no roads and the whole surrounded by a wall. There is more game bred at Rambouillet than elsewhere in the state preserves, and, on account of the wall, it is more easily guarded than in most of the other forests, which are more open. Among the more recent kinds of game introduced into the

Rambouillet forest may be mentioned the Japanese deer, known as the cikasou. Tho the Marly forest is also surrounded by a wall, it is cut up by roads, which greatly mars it for shooting purposes. But it is more picturesquely situated and is much nearer Paris. The Compiègne forest is much smaller than either of these, containing only about 500 acres. President Félix Faure was the first to have the idea of hunting at Compiègne, but he abandoned the project, because of the expense, before it was realized. But M. Loubet carried it out, thanks to the clever financial management of his director of the hunts, Colonel Lamy, tho it cost the Elysée budget some fifteen to twenty thousand francs a year. M. Loubet made this sacrifice because he thought that the Czar, who was then about to pay him an official visit, would like to reside at Compiègne and would be pleased to have shooting at his very door. But the Czar stayed at the residence of his ambassador in Paris. However, M. Loubet, during his presidency, gave many delightful shooting parties in this spot so full of interesting historic memories. But Rambouillet remains the favorite of the French Presidents. They and their friends take the 9:45 train from Paris and are back at the capital at 5:48. On important days, when the chief guests are sovereigns or princes, a luncheon, which is made a principal feature of the day's outing, is given in the fine old castle. On minor occasions, this function is held in the pheasantry. One or two of the menus of these luncheons will show how different these French presidential shooting parties are from the strenuous hunts of the American President, who eats the plainest food when he goes forth in quest of big game.



THE HUNTING GUESTS OF THE PRESIDENT OF FRANCE, AS SEEN BY THE CARICATURIST.

The King of Belgium, the King of England, the King of Greece, the Czar of Russia, the King of Italy and the King of Portugal and others.

Here is the menu of the luncheon given in honor of the King of Portugal, who shot over the Rambouillet preserves with President Loubet, on December 17th, 1904. The list of dishes was beautifully bordered by a design drawn by the well-known illustrator, Morand. The three

views of the castle given in this article are reproduced from this menu, which is given below:

Both President Grévy and President Loubet preferred the simple shooting parties of their early days, when the latter, with a setter and a friend, would tramp over the fields in the neighborhood of his native Montélimar, and the former would do the same in the region around Mont-sous-Vaudrey; where man and dog would work and where the game was somewhat wilder than the denizens of a hennery and would flee and fight for its life. But official existence has its exigencies, and I imagine some of our chief magistrates must have repeated more than once, with an ironical smile, the facetious advice of a personage of opera bouffe, "Let us speak the language of the court, dimmit!" Anyway, it is certain that our presidents, whether very strong or no as sportsmen, have cut a very good figure in the presence of foreign sovereigns and diplomats. I cannot say the same of all our cabinet ministers, and their wives, especially, for they are not always remarkable as hunters or shooters.

MENU OF THE HUNTING PARTY LUNCH AT THE CHATEAU DE RAMBOUILLET.

President Félix Faure made more of this side of his official life than did any other of our Presidents. He prided himself on his knowledge of the sport and enjoyed giving style to his shooting parties. He was, furthermore, a very good shot, as were, in fact, M. Grévy and M. Loubet, who, by the way, was left-handed. President Carnot did not care for the sport, and, tho he continued the custom, he seized every excuse to escape from active participation, and would attend the presidential shooting parties only when etiquet seemed actually to require it. President Fallières enjoys the pastime, but to a less degree than his immediate predecessor, M. Loubet, for he abandoned Compiègne, where under the Loubet administration, were killed every year a round thousand pheasants and from two to three thousand rabbits.

M. Loubet's administration, which covered a period extending from 1898 to 1906, was also the most brilliant of the Third Republic as regards the number of distinguished personages who took part in the official shooting parties, for the list includes the kings of England, Italy, Portugal and Spain, and a number of Russian grand dukes and lesser lights of this category. The best shots among these crowned heads were the kings of Portugal and Spain. By the way, some fifteen months ago, I was an eye-witness of the remarkable cynegetic powers of the King of Portugal. His Majesty was

one of a party of which I was also a member at my friend, Baron Henri de Rothschild's, who has one of the finest hunting preserves in all France. On this occasion, the King killed 1,006 birds or animals, between the hours of 8.30 a. m. and 4 p. m. He fired about 1,400 times. Behind him stood four men, who handed very rapidly the gun all ready to fire.

Presidential shooting parties generally begin about noon and end about 4 p. m. The amount of game killed ranges from five or six hundred up as high as 1,300 birds or animals of one kind or another. There is no regular hunting costume; one may dress as one likes and be armed as one likes. This absence of etiquet at least as regards the matter of dress, adds considerably to the pleasure of these much-sought-after gatherings. There are from twenty to twenty-five parties each year, separated into two grand divisions—official hunting parties and private hunting parties. To the first category are invited the diplomatic body, cabinet ministers and the higher state functionaries; to the second, the President brings his personal friends, well-known artists, professors, business men, etc. The luncheons on these occasions are not only remarkable for good cooking, but are often characterized by very brilliant conversation, especially if there happen to be among the huntsmen M. Hanotaux, of the French Academy and ex-Minister of Foreign Affairs, or M. Georges Pallain, Governor of the Bank of France, who are learned, full of anecdote and famous for their bright sallies of wit. With a good story they could make up for the lack of game, if this were possible at a presidential shooting party, just as Mme. de Maintenon used to replace the absent roast by an anecdote.

Etiquet permits the French Presidents to hunt in the preserves of their friends, and several of our chief magistrates have availed themselves of this privilege. M. Félix Faure liked nothing better than shooting with his old friend, M. Duval, at the Boissière preserves, near Nangis. What pleasant recollections this spot awakens in me! M. Loubet also frequently hunted with friends during his term of office—with Count Potoki, Henri de Rothschild and several untitled republicans of high respectability and position.

A statement of the amount of game killed at some of these presidential meets may be of interest to foreign readers. On October 23d, 1882, under President Grévy, the party consisted of seven, including, besides the President, two grand dukes and Admiral Jaurès, uncle of the present leader of the Socialists in the Chamber of Deputies. The total number of the game killed was 377, of which the President brought down 46, he being surpassed only by the dukes and the admiral. On December 28th, 1892, under President Carnot, there were ten hunters, who totaled 887. The two best shots on this occasion were Lord Dufferin, then British Ambassador to France, and the late M. Develle, then Minister of Agriculture. Next came President Carnot, who was a good shot, notwithstanding the fact that he seldom took gun in hand. The record of October 25, 1897, under President Faure, was 691. The party consisted of four grand dukes, two counts and M. Hanotaux, then Minister of Foreign Affairs, and by its composition reflects the President's tendency to surround himself with titled people. His love of the sport comes out in the fact that during his administration a very detailed record was kept of all the presidential meets. This table will give the reader some idea of the system observed at that time at Rambouillet:

Shooting Season.	Deer.	Rabbits.	Pheasants.	Partridges.	Other Game.	Total.
1895-1896	46	1,622	2,586	88	8	4,361
1896-1897	30	3,161	3,134	194	25	6,544
1897-1898	23	3,732	2,682	209	70	6,116

On December 16th, 1904, while M. Loubet was at the Elysée, there was a party at Marly, when the figures stood: 286 pheasants, 241 rabbits, 4 deer, 1 partridge, two woodcock, 13 ducks, and 14 other sorts of game—making a total of 561. At one of President Fallières's parties, last January, there were twelve guns and a total of 480 deer, rabbits and birds of various kinds.

On the day after the shooting party, or sometimes on the second day after,

each guest receives from the President six or eight pheasants and a haunch of venison, if any deer were killed. In the case of a sovereign, he receives at his hotel fifty to sixty pheasants. The rest of the game is sent to members of Parliament, to high state office-holders, to the friends of the President, even to the servants of the Elysée Palace, to the city hospitals and to members of the municipal council in which the forest is situated where the shooting party met. Nothing is sold. In this respect, an official party differs from those given by private individuals in France, who, after remembering their friends and relatives with presents of game, send the rest to the public market. I consider this course perfectly justifiable, for the expenses attending this kind of sport are very great, in some instances the figures being as high as two or three hundred thousand francs per year.

PARIS, FRANCE.

Progress of the Negro

BY BOOKER T. WASHINGTON, LL.D.

PRINCIPAL OF TUSKEGEE INSTITUTE.

I WISH very much that a large proportion of the American people, especially that element that is inclined to grow despondent now and then regarding the future relations of the two races in the Southern States, might have been present last week at Livingston College during the celebration of the twenty-fifth anniversary of the college.

Livingston College in a large degree is the creation of the African Methodist-Episcopal Zion Church. This special religious denomination has a large church membership of 530,000, mainly in the Southern States, the largest membership being in North Carolina and Alabama; 3,250 church organizations; about 3,000 ministers; together with church and school property to the value of about $2,000,000.

Twenty-five years ago this Church, which had its origin during the days of slavery, put on foot an effort to establish a college at Salisbury, N. C. The leading spirits in establishing this college were the present senior bishop, Rt. Rev. J. W. Hood, and the late Dr. Joseph C. Price, who became its first president and who did the most to make the college known to the outside world. Dr. Price remained its president until he died, a few years ago. He was among the most eloquent and prominent members of our race in this country. Beginning with practically nothing in the way of a plant twenty-five years ago, very largely thru the efforts of the colored people comprising this special Church organization, a property in grounds and buildings has been created at Livingston to the value of $100,000.

But the special point in connection with this celebration which I think would interest the readers of THE INDEPENDENT is in relation to the spirit of the occasion during the time I was present. In the first place, even more interesting to me than the college itself was the cleanliness and general order that pervaded the entire atmosphere. Surrounding the college there are a number of neat, beautiful and cultured homes owned by the professors and colored people who have moved into that community for the purpose of educating their children. The general appearance of these cottages inside and outside would do credit to the civilization of almost any people in any country.

On the day that I happened to be present, I should say that there was a gathering of three thousand people on the grounds. There were present, I think, seven or eight bishops of this Church, headed by Rt. Rev. J. W. Hood and Rt. Rev. A. Walters, hundreds of ministers

and teachers, and people representing every walk of life among the colored people. There were present in the same audience at least five hundred of the leading white people, men and women, of Salisbury, and of the State of North Carolina; the Governor himself was present to represent the State on Friday. Many of the most prominent white people sat upon the same platform with the president of the college and the bishops and other prominent negroes. The Mayor and his wife were present at every session of the exercises. Notwithstanding the Mayor is a Democrat, I was told that he received practically every colored vote cast in the municipal election on account of his fairness toward the colored race.

During the days that this celebration lasted $8,000 were secured in cash and promises for the benefit of the college. Some very interesting lessons were learned in connection with the securing of this money. It was given in amounts ranging from twenty-five cents to a thousand dollars. The man who gave the thousand dollars would not permit his name to be known, but it has now become an open secret that this generous amount was contributed by Dr. W. H. Goler, the president of the college, a negro. When the hour came for subscriptions, it was both interesting and encouraging to see a colored bishop get up and announce his subscription of perhaps fifty dollars, a colored woman stand and announce a subscription of ten dollars or cash, and then the next second to see the Mayor of Salisbury announcing his subscription for a generous amount, a white banker in Salisbury arising in his place and announcing a subscription of fifty dollars, a merchant in Salisbury announcing a subscription of twenty-five dollars, and so on to the end. The white people seemed to be just as anxious that as large a sum of money be secured for the college as was true of the colored people. They seemed just as proud of the success of the college as was true of the large colored audience present. Taking it all in all, it was one of the finest demonstrations of the ability of the two races to live together in peace and harmony I have witness in a good while in the South.

This occasion also impressed itself on me in another direction. One can find fewer finer object lessons in the way of self-help on the part of the negro than is presented at Livingston College. The colored people themselves from the African Methodist Episcopal Zion Church denomination spend annually about $14,297 out of their hard earnings and poverty in maintaining this college.

May I add, in closing, that there are two unfinished buildings upon the grounds. In each case the buildings are sorely needed. One is to replace a building destroyed by a fire some years ago, upon which practically no insurance was secured. Another is an entirely new building to fill a long-felt want. A few thousand dollars would complete each one of these buildings, and I believe that there are enough people in America, especially in view of the fact that these people have raised eight thousand dollars to help themselves, who would like to contribute enough money to complete these much-needed buildings and let the college go on doing its work for the upbuilding of the race and the unification of all the people in the South.

No man could have witnessed the exercises in connection with this anniversary without being impressed, first, with the efforts of the colored people to help themselves, and, secondly, with the willingness of a large element of the best white people in that region to help the race toward a higher and better life.

TUSKEGEE, ALA.

My Rose Garden in June

BY E. P. POWELL

Author of "The Country Home," "Our Heredity from God," Etc.

IT lies down the swale, on a partly shaded bank, and faces the east. I like to see the sun hunt out the roses in the early dawn and kiss them. How they blush; and the dew on the petals looks like tears! My apple orchard is just above, on the slope, and spreads over the knolls, all the way to Harding's meadows. I dream o' nights of the red apples I picked from these trees when a boy—it was half a hundred years ago, and there the trees are still—but tall and full. I was a schoolboy, and going home every evening I climbed up to the Spitzenburgs, in the tops of the trees, and sat there among the red apples, looking over the valley; and then I resolved, when a man, to have plenty of two things, apples and roses.

These two things are not only the finest things on earth, but they are first cousins in the vegetable world. The apple blossom is a single rose, and it is the model after which all roses have been made, and the best ones colored. Another cousin is the pear; and, in fact, the whole family constitutes a group that for beauty and value cannot be excelled. I have them all, and they are here in sight of each other. Cherries and plums go down the other side of the apple orchard, where they face the raspberries and the blackberries that follow the fences—a swath of thorns that few boys like to squeeze thru. Nor is this all; for in the mellow, moist soil of the swale, right alongside of the roses, is the happiest, prettiest, sweetest of all the members of this Rosaceæ family—my strawberries.

Any one who has less than fifty varieties of roses is full of self-denial—a useless quality in these days. If you wish to buy a selection you should take your pencil and mark off the catalog those you do *not* wish for. Gradually you will work your way down to half a hundred, possibly not less than a hundred. You will not strike off all the old-fashioned sorts, for almost as good as seeing the little mother once more is it to have a bunch of the cinnamon roses and the grass pinks that she loved so well and tended so carefully. Nearly as full of memory and peace are the Damson roses and the Cabbage rose. They shall never be banished from my home, and they shall always have a canny spot, where they may be happy and do their best.

The first potted rose that I ever saw was Sanguinea, blood-red, and always in blossom. I remember it best in the old, big brown kitchen, where, in winter, it lifted its head six feet from the window sill, up among the strings of dried apples. It was as full in December as in June, and the fragrance went far to make housework peaceful. [Mem., roses like sunshine, and they like the steam from the washing tub.] That rose will always be linked in memory to

the sweet face of the one who tended it and me; and who governed us both as well. I have planted it on her grave. So memory links us together by many a curious and pleasant mnemonic. I also remember John Carey mainly by the John Hopper rose that grew by his door, and on the other side a Seckel pear tree —he and that rose were so much alike, big and hearty, both in bush and blossom, and as modest as wholesome. They both had thorns, I remember, but only for protection. Sanguinea was a China rose and John Hopper was a Hybrid Perpetual.

Now the best of the China class are Agrippina, and Malmaison, and Hermosa, and not many more; but of the Hybrid Perpetual one may collect about him a long list of magnificent roses. Among the best you will find American Beauty, the largest and sweetest and best of all the extremely hardy sorts. It is always in bloom, of exquisite form and wonderful sweetness. It is a great thing to be loved by everybody, even on the part of a rose, and it is a great thing to have the right sort of name and live up to it. But Clio is hardly one whit inferior to its rival, a rosy pink with a flower almost globular. Giant of Battles and John Hopper and Jubilee make a trio of scarlet, rose and crimson. Dinsmore is a crimson scarlet, and Lord Raglan I remember always for its honey odor, and General Jack because so many other roses try to beat it in its shining crimson and cannot do it. Margaret Dickson is the most superb of all the whites, Magna Charta of the violet crimsons, while Paul Neyron is the biggest and heartiest in all the list, and it is as sweet as it is big. I like Ulrich Brunner because it is always in bloom, giving us crimson flowers edged and flamed with scarlet. However, most of the Hardy Perpetuals blossom only once in the year, in spite of their name, and that will not do for a rose lover in these days. On the other hand, most of the Tea roses are too tender for our Northern gardens, and we must be careful in selecting them or we shall find the labor of protection quite too much for us.

We are, however, no longer compelled to make our choice between the classes named. About twenty years ago, from somewhere, appeared the first of a cross giving us the hardiness of the Perpetuals and the sweetness of the Teas—with continuous bloom. This marvel was called the La France. It still stays with us, and it always will, and it has with it five other La Frances, of different colors. These six constitute a cluster truly magnificent. If you wish to hunt for them you must call for Duchess of Albany, a red rose; Augustine Guinoisseau, a white rose; Mad. Pernet Ducher, a yellow rose; the Striped La France, and the Climbing La France. These hybrid teas are nearly hardy, and many of them quite so in New England. It was a grand field to work in, and it has been worked to magnificent advantage. Nearly all of our finest new roses come under this head.

The glory of the very newest roses is Killarney, an Irish rose, as full of blarney as it is of sweetness—a Hybrid Tea, bringing the fresh cheeks of a half-wild Irish lassie, and the name of the historical lake where she is to be found. The bush is stout and of a deep bronze-green shade—a beauty without a bloom; but the buds are long and pointed and the flowers of enormous size and tea fragrance. They are to be had every day in the whole round year, and the bush is hardy as far North as an elm tree will grow. Another Irish gem is the J. B. Clark; color intense scarlet, clouded with a dark crimson, like the blush on a plum; while the growth is stout, and the green is nearly as dark bronze as Killarney. But the wonder is the size and substance of the blossom; sometimes seven inches in diameter and five inches in depth. It is the modern edition of the Cabbage rose.

Another group that I think would please the most fastidious might be made of Cherry Ripe, a wonderfully free flowering hybrid tea, with light rosy crimson flowers, almost globular, and fragrant as the best rose in the list. With this put Betty, another of the Irish roses, with a ruddy gold flower, of glorious form and deliciously perfumed. It is never out of bloom from June till November, and in Florida you may pick flowers of Betty all winter. Liberty is a deep crimson scarlet, and it has raised a sensation everywhere. You see, when we come to

talk of roses, we soon use up all the superlatives in the English language. Anyhow, there is no rose that beats Liberty, taking it all round, for color and sweetness and strength of growth. The original plants of this rose cost $7,500; you can buy one now for twenty-five cents. I have never yet quite worshiped a rose, but I am willing to go down on my knees to admire Virginia Coxe, when it is in a blaze of its dark velvety blossoms—as it almost always is. Then Helen Gould must be welcomed to make this group complete. It is one of the most satisfactory roses for everybody that was ever introduced. Its long-pointed buds are always breaking open into great, rosy pink flowers, as double as double can be and as sweet as a rose can be. Perhaps we will not be content without adding The Queen, for this is one of the best, if not the best, ever-blooming white rose in existence. It never gets tired of blooming, and its color is as pure as its odor, which fairly fills the air.

One may easily get into a tangle, after all of this, or puzzle, if you prefer, over Safrano, Solfatere, Malmaison, Catherine Mermet, The Bride and the Queen's Scarlet—all old roses with a reputation and with friends who will contend for them all over the country. Then, among those not quite so old, we have Magnafrano, President Carnot, President Roosevelt, Augusta Victoria, Winnie Davis (a magnificent new rose named in honor of the daughter of the Confederacy); all noble flowers, but perhaps no better than Admiral Dewey and Admiral Schley. It was a capital thought to recognize noble characters in noble flowers. Queen Victoria recognized the compliment by graciously saying that she wished she were one-half as beautiful as her namesake. Empress Eugenia is hardly behind the others, and Frances E. Willard has pure snow-white buds and blossoms of the largest size and most perfect form, just as they ought to be.

But how easily one may be lost rambling among the roses; and even yet I have not named what the rose growers have come to call the Cochet Set—five superb ever-blooming Hybrid Teas. Well, if I were compelled to be satisfied with just five roses, I would take these—one of pink, one snow-white, one red, one yellow, one crimson; and every one of them superb. Ah, well! Let me get away from these delightful companions, or my gossipy notes will find no end. I cannot tell you what my roses have done for me in the way of sweetening life, and possibly sweetening character. The charm of growing roses is their companionableness. I do not know why a robin, of all birds, seems to be nearest to us; nor why a rose, of all flowers, gets a warm place in our affections—but so it is. And that, I suppose, is why so many of them carry human names. Then, for giving away, a bunch of roses or a single rose is the sweetest, simplest and best of all tokens of love. And tomorrow there will be just as many more smiling at you from the bushes; you can be as generous as you please. But when you go to buy your roses, for I know that I have set you all agog for a bed of your own, do not accept the little slips of bushes, three or four inches high, with roots just started, but always buy good, stout two-year olds, and insist that they be grown on their own roots—as a rule. All these modern roses tax us if we desire to have them in perfection. They will not give us noble flowers on feeble wood. They are gross feeders and rarely cry enough. You should have a compost pile of old barn manure, and sod, and decomposed leaves, with a portion of coal ashes or sand, or both, to more completely make the soil friable.

This rosebed of mine is hid, away back from the roadways, along the slope of the Oriskany Valley. But if you wish to know what a rose wilderness is go to middle Florida—down there where you will get confused as to winter and summer, and can pick a Malmaison in January or a Queen's Scarlet at any time. You go by a negro hut run all over with Cherokee roses, and sometimes a Bridesmaid twined with the other; cardinal birds flitting thru to clean them of insects—or is it to compare their scarlet breasts with the scarlet roses? You can do anything you please with the running sorts, for they never kill back—especially arching over gateways and bowering well-curbs and henhouses. Perhaps the hens do not lay any more eggs; but the

chicks and roses make wonderfully pretty pictures. Huge pines overhead, with trunks sixty feet to the first limbs, and Bignonia golden-flowered, climbing up seventy-five feet in a season, and, in January, swinging out immense banners of yellow and green—altogether is it not fine! But even the roses must divide the law with the ever-present and ever-changing profusion of wild flowers.

I am proud of Florida; it is rightly named. Snow and ice do not touch its borders; frost rarely smells of its loquats and roses. The wing of a blizzard sometimes fans it gently, but zero is not in its vocabulary. Its lakes are just big enough for a farmer to own a whole one, and so he may grow shad in the shade of his own porches. I am not sure which member of the rose family I prefer in March; whether it be the peach, half-covered with blossoms and half with fruit; the plum, just tossing its infinite white petals to the Gulf breeze; the crimson strawberry, covering the ground; or Safrano and General Lee, covered with their great yellow and carmine buds. On the whole, I think it is the only one that I do not have here, as yet, the apple; the kingliest rose of them all; and for that I must go back to my New York valley.

And here, here between the orchards that half-cover the sloping hillsides, the rose has had the good judgment to blossom in June. It has had the pick of the months, and the month has had the pick of the flowers. It has left to May the shrubs, May with its occasional squalls of snow and its burst of summer sunshine. It has left to August the lilies; but in June, sweetest and completest of months, with its green meadows and its strawberries, the rose revels everywhere. It clambers over the rock piles and the stone fences, laughing with the soft breezes; it flings handfuls of odors into our sleeping rooms; it ozones the world. There are enough for the poorest, and enough for the children. Great bunches are on the table of the school ma'am, and, as I write, I catch inspiration from those that, climbing around my window, look in upon my work. How many poems have they written? Blessed June! You not only share with May the kingly apple blossom, but you have all to yourself the queenly rose.

CLINTON, N. Y.

Summer Song

BY CLINTON SCOLLARD

Dogwood in the dales
  Whitens hour by hour;
Iris in the swales
  Feathers into flower;
And the oriole,
  Thru the golden noon,
Pours his lyric soul
  Out in tune!

Life's a wondrous cup
  Flooded to the brim;
Seize it, friend, and sup
  Ere the day grows dim!
Spelled with ecstasy,
  Free from every gyve,
It's enough to be
  Just alive!

CLINTON, N. Y.

How New York Appears to a Southern Woman

BY MRS. L. H. HARRIS

New York is a wonderful place, broadening to the mind but confusing to the morals. The people do not reckon life by morals, indeed, but by "conditions." They have a great deal of information, but not much wisdom. They are fresh and appear to be developing a new kind of egregiousness which makes them at once depressingly pessimistic and absurdly optimistic. And I have never seen any place where there was greater need of pure food laws for the mind. They have absolutely no protection against any kind of knowledge, however dangerous. And, all told, they are diabolically intelligent. I did not meet a single person who could not get the best of me in the discussion, no matter how wrong he was. But my only misgiving was one which every Southerner must entertain, of not knowing whether the people were kind to me because they really liked me, or because it was their aggravatingly superior way of bearing with what they considered a narrow-minded, invincibly ignorant person.

A Northern visitor in the South is always more interested in the blacks, the desperately poor and disreputable, than in the rest of us. Personally, I have no doubt that this taste, this curiosity, this morbid sympathy had much to do with the abolition zeal in the North before the war. However that may be, Southerners do not share it; and I was more particularly interested in the respectable people of New York. There were no young ones among them. I did not see a dozen children during the month I was there, except on the Bowery. But, of course, New York is not dependent upon this source for its population. It imports citizens from the ends of the earth, full-grown and work-broken. This accounts in part for the seething mind to be found there. We bring up our own generation here in the South, and so we know what we are getting. It keeps us a trifle behind the times, but we are repaid in peace of mind. When a man is autocthonous he is not so likely to throw bombs or to kick against the pricks. If New York had more babies in its homes there would be fewer "revolutionists" in its streets.

Another thing one misses upon the streets is the cheerfulness of the poor. With us they are still the happiest class as a whole. But in New York they wear a wise, cynical, bitter look, as if they had caught on, and considered that they had been cheated. They have learned the lesson of the new economists. They are not thankful for charity. They want their rights—that is, Wall Street and the fulness thereof, share and share alike. These low-browed, sulky looks contrast strangely with the mercenary formation of the human countenance in the more prosperous parts of the city like Fifth avenue. However, it is no use to put on airs. We are getting the same expression down here as fast as we can. The difference is that on Fifth avenue it is a remote million-dollar stare and with us it is a simple one-dollar look. The former is founded upon financial egotism, the latter upon financial incompetency, and it is hard to tell which is worse for those who come after us.

The finest looking, most intelligent and capable people to be seen in New York are on the ferries and subways in the late afternoons. They have not yet got the ugly money birthmark, and they evidently belong to the achieving class who govern the city, count her change and keep an eye upon the government. But this reminds me to say that for people who have excellent manners at home and in their own social circles, New York men have the worst I ever saw in

public. They are as innocent of courtesy as Brobdingnagians. When I complained of this to one of them, he said that it was "due to the shape of Manhattan Island." It was not wide enough to permit business men to carry their politeness around with them. But my own impression is that there is a sentiment against courtesy, especially to women, on the grounds that it is mawkish and that they do not deserve it. Possibly they agree with Schopenhauer, who thought that the notion of gallantry and reverence for women are products of Teutonico-Christian stupidity. He says "these notions have served only to make women more arrogant and overbearing; so that one is occasionally reminded of the holy apes in Benares, who, in the consciousness of their sanctity and inviolable position, think they can do exactly as they please." Certainly this comment cannot apply to the women on the cars and in other public places in New York, but it is the men who remind one of the holy apes of Benares. This may not indicate a reversion to type, of course, but it shows an astonishingly primitive nature impervious to the softer graces of civilization.

I have already intimated a partiality for respectable people, but there is another reason why the stranger does not see all the people in New York, nor even all the different kinds. Race prejudice there is so strong that it results in local segregations almost incredible to the more liberal-minded Southerner. I did not learn, for example, where they keep their negroes, Chinese and Hottentots, except when they invite them to dine—this invitation to dinner now and then is the subterfuge used there in the place of that universal social equality which they advocate for us in the South. As a matter of fact, New York is the home of all the different kinds of race antipathy. The whites, blacks, yellows and browns have a *natural* aversion to one another. We know nothing of these jungle sensations here. With us it is simply the duty of preserving the standard and integrity of a higher race from the disintegrating effects of a lower, all the harder to do because we have an affection for the latter. And this difference illustrates a universal difference between the people of the North and the South which must interest the close observer. The former are more highly developed intellectually, but they are decidedly more primitive and savage and tribal natured every other way. They are not nearly so evenly civilized as Southerners; and they have apparently used their gifted heads to preserve these primitive traits of hardness and ferocity against each other.

But of the people I did see, those on the Bowery showed more monotony of features than any other. The only thing like it is a big negro quarter on a Southern plantation where the same lack of variety exists in the cast and expression of the black faces. And there were fifteen hundred Germans in the Atlantic Garden one afternoon who looked like twins; but this probably resulted from the fact that they were all half-asleep. A poor young thing who thought she could laugh with her legs was on a stage in front trying to amuse them. This was why they slept. It is impossible to amuse people in New York, because their faculty for amusements is jaded, and most of them have lost the power of illusion. The only way to deceive them is to let them deceive themselves. They go to the theaters and aggravate themselves with an analysis of the play, but they do not come under the spell of it, because they have the decomposing mind.

Evidently there are as many of the people who belong to the eternal order in New York as elsewhere, or the thing would not hold together as it does. But because they do belong to the order, rather than to the disorder, they attract less attention than those who simply make the prevailing noise of the place. These have a consciousness founded upon an egotism so naïve as to be diverting. This accounts in part for their obsession for "world movements." You do not need to be a great or gifted person in New York to lead a "world movement." All you need is the idea and the vocabulary. Even if you do something wrong or queer or foolish, you do not drop out of notice in your embarrassment, but you select the "movement" which corresponds to your dilemma and you give lectures upon your "specialty." Fortunately the wise old world is rare-

ly ever moved. Here are the delegates to the Peace Congress, for example, getting ready to move for "universal peace." It is a grand idea they have got merely in their heads. Nothing in history or experience warrants it. We shall never have universal peace, because we do not want it. A nation may have its little decadent spell for a generation or so when the bankers and tariff-makers get the best of the situation, but it cannot last, because men are not born civilized, and eventually enough of them will escape to make a stand against the bedsores of a too-peaceful civilization.

Down here we are too sane to entertain such illusions; and we think more of ourselves than we do of the world. And even if this is selfish, it is not so bombastic as mistaking a torchlight procession for a "revolution." We are not nearly so clever as the people who make these mistakes, but the kind of sense we have keeps us level-headed. The peculiarity of these thrilling, stirring world errants is that they speak in terms of universality about abridged personal experiences. Besides, they do not mean what they say. They have the most daredevil brain courage, but, observed closely, even the "terrorists" prove to be lambs in wolves' clothing. The most looked-down-upon man I saw in New York was a poor apologetic anarchist who had missed his cue and actually thrown a bomb somewhere. He sustained the same relation to the terrorists that a man who eats with his knife sustains to polite society—an egregious person incapable of understanding the spirit of the thing. And so he was. He thought that these people who talk so threateningly about turning things upside down were in earnest, but they are not. Their forte is to "create public sentiment." Somebody else will do the world moving if it is ever done.

In conclusion, New York is spiritually minded, but not religious. The people do not go to church for the same reason that we do. We go for the sake of convention, or because we are really pious, or because we hope some time to be convicted of our sins. And they do not seem to feel the need as we do of being born again. Most of them are too well fortified with theories of evolution even to bother about repentance, and one almost fears that some of them regard sin as a preliminary stage of virtue. But without exception they are keen humanitarians, and they ask no odds of the will of God. They can do their duty without prayer or fasting, and they visit the widow and the orphan as if the Lord had nothing to do with it. In short, they are academic sentimentalists. They are deeply moved by any kind of abuse, and they will go to admirable lengths to correct it; but there is nothing personal in their championship. They care not at all for the people whom they rescue except to take credit for them in some kind of "report." They have a theory of life which takes the kindness out of charity and which insults gratitude. Having bound up his sores and called an ambulance, a New York humanitarian would coolly turn his back upon a Lazarus and never think of him again. Nothing could be more heartless, but it is what you may expect of people whose civilization is designed chiefly for the head and not the heart.

NASHVILLE, TENN.

"Devolution" and Other Topics in Westminster

BY JUSTIN McCARTHY

"DEVOLUTION" is naturally the subject of public discussion here which especially interests me. In their measure for the establishment of a Council in Dublin, the Liberal Ministers have shown their hand with regard to what they propose to do for Ireland at present in the matter of national self-government. Now it is essentially necessary to bear in mind the words "at present" when we come to consider the meaning, the purpose, and the value of the proposal which Mr. Birrell offered to the House of Commons a few days ago. If the new arrangement were put forward as a Home Rule project then it would, indeed, seem to be but a very poor joke utterly unworthy of so brilliant a master of humor as Mr. Birrell. But then we must bear in mind that not only was the measure never put forward as a plan of Home Rule, but that it was again and again distinctly announced as meant only to be a first step in that course of devolution by means of which Sir Henry Campbell-Bannerman and his colleags propose to prepare Ireland for the work and the responsibilities of Home Rule.

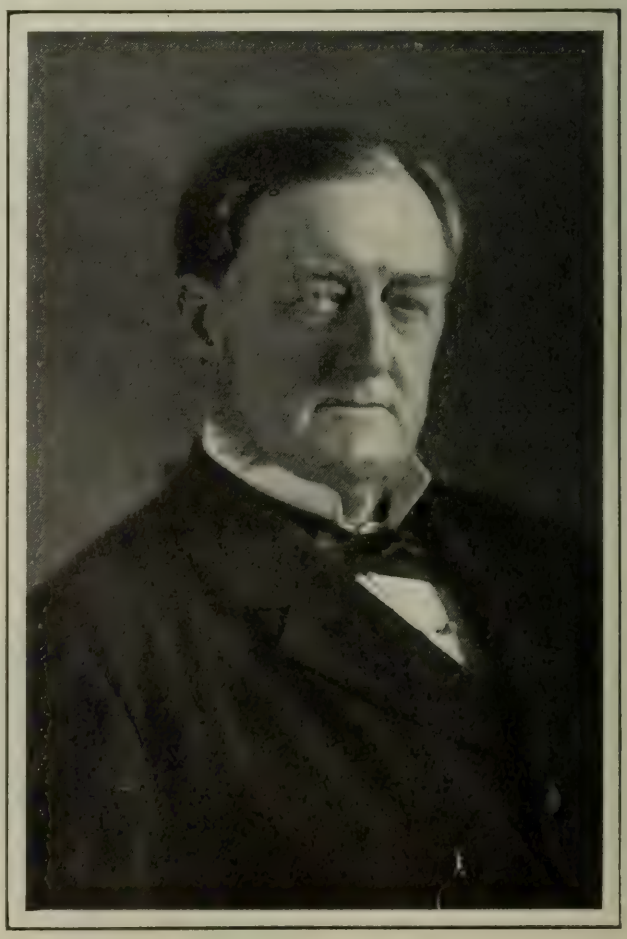
The very word "devolution" itself has grown upon us and become part of our daily speech—I often feel inclined to wish that we had not been favored with that addition to our common parlance—in order that we might the more clearly understand how gradual was to be the process of development by which Ireland was to grow into the capacity for minding her own business. I need hardly say that I do not believe Ireland needs any such gradual process of devolution, a process thru which the Canadian and Australasian colonies were not compelled to pass, and that I feel quite sure she is as well able to manage her own affairs at this moment as is any other country in the world. All that I am desirous to impress upon my readers is that the measure now introduced was announced to us from the very beginning merely as a first and experimental stage in the journey toward a complete system of Home Rule. It was in that sense that Mr. John Redmond, the leader of the Irish National Party in Parliament, received and interpreted the measure and in that sense, and that alone he gave it his very moderate and carefully qualified approval.

Mr. Redmond has a remarkable combination of two qualities not often found combined in a political leader, brilliant eloquence and genuine statesmanship. He took the Government measure for what it is worth and for no more, accepting it merely as an avowed instalment of the great and complete work yet to come. The measure at all events gives to Irishmen the right of managing a large proportion of their national affairs by a governing council of whom the great majority are to be elected by Irish National votes, a national council which is to disestablish once for all and utterly that odious system of Castle government which for so many generations has worked with such degrading influence on the whole condition of Ireland. Mr. Redmond did not, however, commit himself to any absolute adoption of the measure as it stands. He and his followers gave their vote in favor of the first reading, in other words the mere introduction of the bill, but he reserved his course of action with regard to its further stages until the great Irish National Convention brought together for the purpose, and representing the feelings of Irishmen at home and abroad shall have fully considered the whole subject and given its decision.

I may say for myself that I am very hopeful on the whole with regard to the meaning and the ultimate effect of this devolution process. I feel well assured that Sir Henry Campbell-Bannerman, the Liberal Prime Minister, is a sincere and convinced supporter of the principle of national self-government for Ireland. I have felt quite satisfied on this point for many years and I know that he is not a man to be shaken in his conviction by

any doubts or hesitations or fears on the part of some of his colleags who may feel inclined to keep in tone with the views favored by what is called "society" and the West End. I know also that Herbert Gladstone, Home Secretary in the present Liberal Ministry, was a convinced Home Ruler even before his illustrious father had become a convert to the Home Rule doctrine. I know John Morley and John Burns, and I therefore look out with unabated confidence to the new era which is opening in the history of my native land.

I have lately been studying a most remarkable pamphlet published my Messrs. P. S. King & Son, of Orchard House, Westminster. It is entitled "The Distribution of Land," and its author is the Hon. Rollo Russell. Mr. Russell comes of a great house and is a member of a family which has made an undying impression on the history of England. He is a son of the late Earl Russell, the famous Lord John Russell, who proposed and carried the great Reform Bill of 1832. Rollo Russell's work, just published, will, I am sure, be found intensely interesting by American readers. It deals with the land system, the semi-feudal system as he calls it, with regard to the settlement and ownership of land in Great Britain. Mr. Russell truly says:

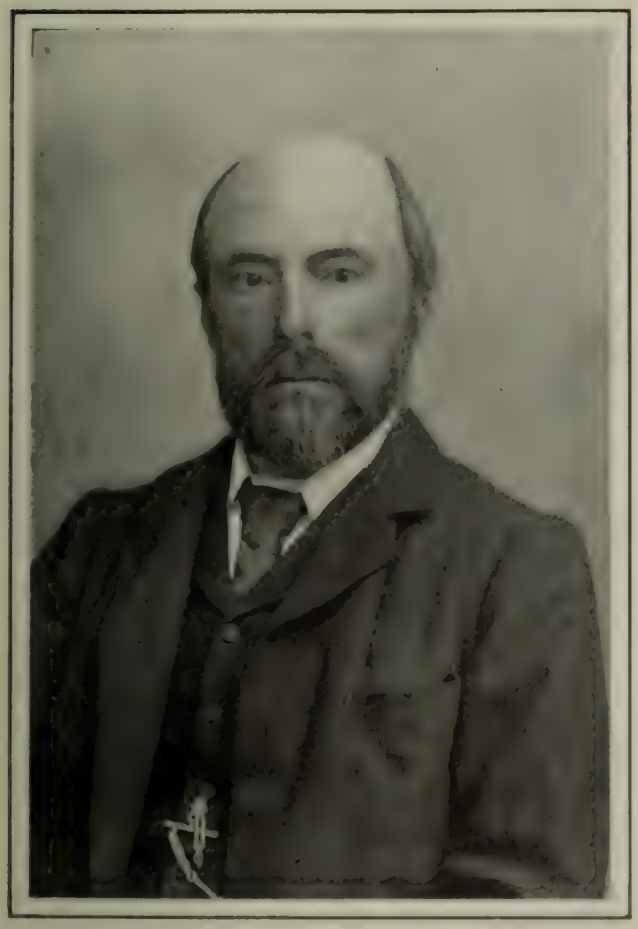


"It is astonishing when we consider how far Liberal ideas have carried us in some directions during the last eighty years, to find that we are still trammelled with an antiquated and clumsy system of law which drives from their own country-side all but a small remnant of the men of Britain, and that most of that remnant exists at the caprice of the so-called owner of the land."

This sentence may be said to contain the text of Mr. Russell's argument. He goes on to say:

"It is hardly possible for any one who cares for the future of our race to pass first thru the open uninhabited country and then thru that mass of degraded population which festers in our large towns, without feeling, if he realizes the causes at work, that the first object of the British people as a whole should be to resume their right to their own land."

I shall not attempt here any summary of this most valuable work. I only think it necessary to say that by the most careful and accurate array of facts and figures, by the most exhaustive argument compressed nevertheless into what is comparatively a very limited space, Mr. Russell makes good his case. Let it be borne in mind that these pages are not the diatribes of some impassioned agitator born in some region of wild and unlettered democracy, but that they express the convictions of an aristocrat belonging to the highest order, a man of the best culture and scholarship, a man who has taken little or no part in active political warfare and who is led to his conclusions by a profound study of the whole subject and by an intense and hereditary sympathy with the cause and the sufferings of the poor and the laboring classes. I quote again from Mr. Russell:



"In a careless way we assume that we English own England. In equity and in theory we do; in fact we do not. We realize that as Britons we have to defend Great Britain against foreign enemies. That is not our immediate task and it never will be if we keep true to our duties, our rights and our religion. Invasion has to be guarded against but it is a remote contingency, and our strength will perish from British delinquencies before we are conquered from outside. * * * The enemy of England is in the midst of us, inflict-

H. CHAPLIN.

ing inexpressibly more serious damage upon the British people that would be suffered from any foreign aggressor. What Frenchman has permanently lost his footing on the soil and his home thru defeat by Germany? Has any been denied the right to build a house, to buy a field, to sit by the threshold, cultivate his garden, and to rear his family in pure air amid loved surroundings? Yet over the greater part of England every one of these primary rights, these most precious elements of peace is denied to the cultivator."

These are Mr. Russell's main positions, his convincing arguments are

F. A. R. RUSSELL.

made clear, are conclusively demonstrated in the pages of his pamphlet. I feel sure that I have said quite enough to commend this remarkable publication to readers thruout all the United States.

Another member of the great Russell family has just been attracting the attention of our public in a different field of controversy. This is Mr. Bertrand Russell, nephew of Mr. Rollo Russell. The younger man suddenly presented himself in the election for the constituency of Wimbledon against Mr. Henry Chaplin, the accepted and very popular Conservative candidate. Bertrand Russell came forward, not merely, not even

C. R. BUXTON.

especially, as the champion of Liberalism, but as the champion of woman's suffrage. The attempt was chivalrous, but utterly hopeless. I have always been myself an advocate of women's right to have a vote on the same terms as men, but I cannot help doubting whether the candidature of Bertrand Russell could have been greatly assisted by the advocacy of some of the Suffragettes who were asserting themselves on his side. I trust that Bertrand Russell may have a happier chance and a more suitable constituency before long.

From all parts of the world sympathy will go forth to John Dillon in the heavy calamity which has just fallen on him, the death of his most loved, most loving wife. Mrs. Dillon was the daughter of one of our most distinguished judges, Lord Justice Mathew, who is nephew of the famous apostle of temperance, Father Mathew. John Dillon was married to Miss Mathew some twelve years ago and they had several children. They were a most devoted pair, friends and companions as well as lovers. I knew them well, and knew what a perfect affinity held them together in life. I had

not heard that Mrs. Dillon was in broken health, and the news of her sudden and early death came as an indescribable shock to me and mine. John Dillon was a true and devoted patriot son of another Irish patriot who sacrificed much for the cause of Ireland. John Dillon was for many years one of my closest colleagues and dearest friends in the Irish Parliamentary party. He was leader of the party for a time, and it was only at his own express desire that he was allowed to retire from a position which he had maintained with so much distinction and so much success. Political opponents, as well as political friends, will give him their sympathy in his sorrow.

Messrs. Chatto & Windus, of St. Martin's Lane, London, have just begun the publication of a series of large and beautiful "Color-Books," illustrating various countries—illustrating them with the pencil and the colors of the artists as well as with the pen of the writer. The two volumes already published are "Venice" and "Switzerland." The "Venice" volume is written by Beryl De Sélincourt and May Sturge-Henderson, and is illustrated by Reginald Barratt, A.R.W.S. The "Switzerland" volume is written by Clarence Rook and painted by Effie Jardine. The volumes are in fact a complete study of each region, its history, its people, its literature and art, its scenery, and these studies are brought into life-like illustration by the colored pictures with which the volumes are lavishly enriched. Nothing could be more effective than the realistic outlines and the vivid coloring of these pictures, in which the peculiar atmosphere of each place is reproduced. One seems, as he holds each large volume and looks on its pages to be actually gazing on those scenes among the mountains and lakes of Switzerland, among the canals and the palaces of Venice with which we have, most of us, made ourselves familiar in our seasons of holiday travel. We are promised farther volumes on such subjects as "The Color of London," "Cairo, Jerusalem and Damascus," "The Rhine," "Lisbon and Cintra," "Assisi of St. Francis," "The Pleasant Land of Devon." I feel inclined to think that American readers will welcome with especial interest this brilliant series of artistic volumes. Americans as we all know have a genuine love for the scenery of the Old World, and some of us have met some of them amid the most delightful scenes of Italy, Spain and Greece, of Turkey and of Egypt and of Palestine. I think, therefore, that I am safe in assuming that these new color-books and the volumes to succeed them can hardly fail to find their way into the homes and the appreciation of many American readers—not merely to stand on the shelves of libraries but to be opened by eager hands and studied by sympathetic eyes.

We have now in London a new monthly periodical, *The Albany Review,* which began its career in April and seems to me to carry with it great promise of success. It is published by Messrs. John Lane & Co., of London and New York: is edited by Charles Roden Buxton, and has among its contributors to its first number Thomas Hardy, Andrew Lang, G. W. E. Russell and many other distinguished writers. *The Albany* is in fact founded on the periodical once known as *The Independent Review.* I am not about to enter into anything like a survey of *The Albany's* remarkable first number, but I cannot help testifying to the surprise and delight with which I read a poem appearing in its pages and described as "Fragment from a Ballad Epic of 'Alfred.'" Now this poem bears the signature of G. K. Chesterton, and that name is well known indeed to all English readers, but is not much associated in their minds with poetic imaginings. Mr. Chesterton has made a peculiar reputation for himself by his writings in *The Daily News* and in other papers, but his fame is that of an ingenious and perplexing, not to say tormenting, inventor of prose paradoxes. One cannot help reading him but one sometimes gets weary of having it proved that two and two make fifteen and that a square must properly be of circular form. Yet here is by this same Mr. Chesterton what seems to me to be genuine poetry, a very inspiration, full of thought, fancy, feeling, and with much music in its lines. I have not the honor of knowing Mr. Chesterton personally but I give him my most cordial welcome in his new capacity as an English poet.

London, England.

The Initiative and Referendum in Operation

BY ARTHUR SHERBURNE HARDY

[Mr. Bryan's recent public espousal of the initiative and referendum is likely to increase the agitation in the United States toward that much needed reform. The initiative and referendum has already been adopted in Oregon and a few other of our Western States, but it has not been tried long enough to form any very positive conclusions as to its workableness in America. The following article gives the experience of Switzerland, which was the pioneer nation to adopt the measure. Mr. Hardy, as our readers will remember, was recently the United States Minister to Switzerland.—EDITOR.]

THE power to enact laws may be exercised directly by the people, or may be delegated by them to chosen representatives.

This theoretical classification is, however, never perfectly exemplified in practice. Even in the smallest or most primitive communities, where direct government has been most nearly attained, the representative principle is always found in some form, it being practically impossible for the people at large directly to administer the finances, to elaborate, execute, interpret or revise laws, to conclude treaties, declare war or determine conditions of peace. The delegation of power by the many to the few has therefore been a universal principle of government.

Two evils inevitably follow: First, a more or less complete divergence between the will of the people and the acts of their representatives, and, second, the inability of the former to remedy this divergence with the desired promptness by the choice of new representatives. That delegated authority often fails to conform to the will of those from whom this authority is derived, and that the complicated machinery by which changes in the representative body are brought about operates too slowly to make the popular will really effective, are facts which need no illustration.

To correct these evils is the object of the referendum and the initiative. By the former the people, while delegating its power to representatives, reserves the right to reject or approve their decisions. By the latter it still further controls delegated power by reserving the right to initiate legislation. The referendum enables the people to confirm or veto the acts of its representatives; the initiative enables it to propose new laws, or to alter, or abolish, those already existing.

These counterpoises to delegated power appear in the earliest forms of representative government in Switzerland, but modern legislation begins with the Constitution of 1848, under which the people possessed the right to demand its revision, and to accept or reject a new Constitution. By the Constitution of 1874 the power reserved by the people was still further increased, it being provided that all "Federal laws shall be submitted for acceptance or rejection by the people if the demand is made by 30,000 voters or by eight cantons. The same principle applies to Federal resolutions which have a general application and which are not of an urgent nature," the demand to be made within ninety days following the publication of the law or resolution.

The initiative was introduced July 7th, 1891, when, under the forms prescribed for constitutional revision, the Constitution of 1874 was amended as follows: "The popular initiative may be used when 50,000 Swiss voters present a petition for the enactment, the abolition or the alteration of certain articles of the Federal Constitution." Petitions may be presented in the form of general suggestions or of finished bills. In the former case the Federal Assembly must elaborate a finished bill, or if it does not agree with the petition, may elaborate a bill of its own, in any case submitting to the people the question whether there shall be any enactment, and if so, whether in the sense proposed by the petition or by the Assembly.

Not only in matters of Federal concern, but also in cantonal affairs, the Swiss people retain their control over legislation, all the cantons possessing in some form the initiative, and all except one the referendum.

Much diversity of opinion prevails among Swiss publicists and legislators as to the practical results of the referendum and initiative. Naville, of Geneva, declares that the large number of abstentions proves that it is not the people, but a relatively small part of the electoral body which accepts or rejects a law; that political leaders having a majority in the legislature always possess the means to secure a popular majority, especially when the law is a complicated one; and that it is ridiculous to suppose that each citizen can form a just and matured opinion upon the laws submitted to him. One of the strongest claims made for the referendum was that it would silence the protestations of the minority by showing where the real majority is. This claim the remarkably large number of abstentions would certainly seem to negative. In the case of so important a measure as the constitutional amendment of July 7th, 1891, establishing the initiative, less than one-half the registered voters (641,692) participated, the affirmative and negative votes being 183,029 and 120,599 respectively. Only when a fine is imposed for failure to vote is the voting general. For example, in two communes of the canton of Zurich, where voting is obligatory, 94 and 97 per cent. of the voters took part, while in three communes where voting is not obligatory, only 19, 14 and 10 per cent. voted on the same measure. From 1869 to 1888, in sixty-eight measures submitted to the people in Berne, the average abstentions was 45 per cent. In Bale-Campagne, from 1864 to 1881, of ninety-four popular votes, seventeen were altogether without result, because an absolute majority, as required, took no part whatever. To defer the exercise of the popular judgment to a fixed time, as in the canton of Berne, where the people are called upon to pronounce on public measures once a year, entails serious disadvantages. On the other hand, to refer each measure to the people as it is passed, as in Soleure, where in 1892 there was a popular vote every three weeks, is a heavy tax on the time and interest of the voter. On certain measures the average voter is clearly incompetent to pass judgment. It would unquestionably be difficult to discriminate between measures which can or cannot be submitted to the suffrage, but neither the experience, the education or the intelligence of the people justifies the contention that legislation by them is possible in the sense that each citizen can study, digest and form a really personal opinion on every submitted law. This is especially true of measures which affect the budget and the control of expenditures, a fact generally recognized in Switzerland by exempting the budget from the referendum. In Berne, where the compulsory referendum is in force, the people on several occasions rejected the budget. Finally an article withdrawing the budget from the referendum was inserted in a bill which, having certain economics in view, was sure to receive popular sanction. This trick succeeded, and the budget is not now submitted to the people. The uncertainty of elections shows that the predictions, so frequently made, as to what the people would do if certain measures were referred to them, are untrustworthy. No one knows what the people will do until they have acted. The experience of Switzerland indicates that many expenditures justified by the national need and important for the national development, which indeed subsequently became the cause for national pride, would be vetoed by the taxpayer. Great measures of this nature are initiated by the far-seeing few, but are not favored by the cautious majority.

M. Lavelaye, commenting on the practical results of the referendum in Switzerland, asserts that it has not only shown itself hostile to large expenditures, but decidedly parsimonious. Motives of this character explain the rejection in 1894 of the proposition to appropriate the meager sum of 2,000 francs for the Swiss Legation in Washington, then most inadequately provided for.

In one respect the referendum and initiative in Switzerland has proved a complete surprise, disappointing both the hopes of its advocates and the fears of its adversaries. They were demanded

by the radicals and opposed by the conservatives. Yet they have proved antirevolutionary and conservative, and the suffrage, radical in the election of its representatives, rejects everything which they propose. By some it is contended that this result is due to the fact that, while elections obey a *mot d'ordre,* party prejudice and discipline, and are therefore radical, the referendum appeals to personal judgments. Others see in this tendency to economy and conservatism, not the intelligence of personal judgments, but the inertia and resistance to change of the masses. Zemp, a late President of the Confederation, affirms that experience shows the Swiss people to be more conservative than their legislators.

As illustrating the opposite character of the conclusions of distinguished men in Swiss public life, two may be quoted. Dubs, Federalist and ex-President, points out that in the ancient Landsgemeinde the whole people appeared together for the discussion of public questions and were deeply influenced by a sense of unity; that the deposit of a ballot *yes* or *no* in an urn, without previous discussion by the people assembled for that purpose, by scattered voters, fails to supply the ennobling motives of the primitive gathering of a small, united population.

On the other hand, Professor Hilty, the well-known Bernese writer, maintains that the people gain a better knowledge of the laws thru the referendum, legislators being forced to prepare them in a simple form easily comprehended by the masses; that patriotism is stimulated, the State ceasing to exist apparently for a privileged class, and responsibility developed; and that while infallibility cannot be claimed for the people, they have made relatively as few mistakes as legislative bodies. He admits, however, that the referendum and initiative cannot find universal application, and in this respect agrees with Signorel, who, in his study on the referendum, published in 1866, concludes that more than any other country Switzerland possesses the necessary conditions for good democratic government, and therefore that conclusions founded upon Swiss experience cannot be applied elsewhere.

The following affirmations of popular opinion are suggestive:

By the referendum of March 15th, 1891, a law on pensions for Federal officials, providing a maximum indemnity of $400 on retirement, non-election or on account of infirmities contracted in the service, when the incumbent had served fifteen years, and of $500 after thirty years of service, unanimously passed by both houses, was rejected by the large popular vote of 353,977, against 91,851.

As indicative of the opposition to centralization, two cases may be cited. There exists no Federal law determining the right to vote, this right being regulated by cantonal law. Bills designed to remedy the diversity of cantonal legislation have twice been rejected by the people. Again, a bill providing that everything relating to the Federal army should be solely within the jurisdiction of the Confederation, was rejected by the referendum of May 11th, 1884, probably because it created military districts not coincident with cantonal boundaries, and was regarded as a first step toward more radical measures of centralization.

As evidence of the popular distrust of State socialism may be mentioned the referendum of September 29th, 1895. The Federal Constitution gives the Confederation the right to take measures for the health and safety of the working classes. On complaints of the injury received by the operatives in certain manufactories of matches, the Federal Council proposed a monopoly of this industry. This proposition was rejected by the people. Again, in 1894, the Socialists obtained 52,357 signatures to a proposition to insert in the Constitution a clause to the effect that the right of every Swiss citizen to remunerative labor should be recognized and made effective in every possible way by Federal, cantonal and communal legislation. It was overwhelmingly rejected by 308,298 votes, only 23,453 more voters than the petitions declaring in its favor.

The law on epidemics, prescribing preventive measures, requiring physicians to report cases, decreeing compulsory isolation and vaccination was defeated in 1882 by a large majority. Private interests, family ties and the prejudice of ignorance prevailed against gen-

eral considerations of the public good. Compulsory vaccination, however, became a law in 1887. Not infrequently the inclusion of several measures in the same bill has led to results which would probably have been different had each project been presented separately. Thus in the first law submitted to popular vote (1875) the provisions for divorce would probably have been defeated had they not been associated with others giving precedence to civil over religious marriages, prescribing that economic, confessional and police considerations should not be recognized as obstacles to marriage, etc. The acceptance of this law has resulted in a higher ratio of divorce to marriage in Switzerland than in any other European State.

The investigation, demanded by the Liberals and Free Thinkers, of the application of Article 27 of the Constitution authorizing the Confederation to proceed against such cantons as did not comply with its provisions for complete liberty in matters of conscience and belief in the public schools, on the ground that the law had not been applied and that in certain Catholic cantons instruction was given by authorized religious communities, was rejected by a majority of 146,129 in a total vote of 490,149, thus condemning an anti-religious and disturbing policy.

As regards the death penalty, which had been abolished by the Constitution of 1874, an unusual increase in crime led in 1879 to a constitutional revision under the compulsory referendum, which gave to each canton the right to establish the death penalty for crimes not political. This was regarded as a victory for the Federalists. Only ten of the twenty-five cantons have availed themselves of this right.

In 1887 the Society for the Protection of Animals inaugurated a campaign against the method of slaughter (bleeding) practised by the Jews. A jury of experts declared that this method did not occasion greater suffering than that practised by Christians (felling). On an appeal of certain cantons to the Federal Assembly, the latter declared in 1891 that the Jewish procedure was not prejudicial to public order or good morals, and that liberty of conscience dictated its authorization. Not discouraged by this rebuff, the society secured 83,000 signatures for a constitutional amendment prohibiting the slaughter of animals not previously stunned, presenting a finished bill in this sense. The Assembly presented no counter bill, but counseled rejection. It was, however, approved by the people. This enactment of a clearly intolerant measure, founded on race prejudice, was the first use of the popular initiative. Only four other instances of its use occurred during the ten years after its establishment, and in all four cases the people rejected the propositions of those demanding the vote. Personal conversation with Swiss statesmen elicited no enthusiasm for either the initiative or referendum. If obliged to crystallize their opinion it would not, I think, be unfair to say that while great movements in the direction of progress often originate with the masses, the orderly process of the initiative has as yet produced no positive results and that legislation is better left in the hands of what Mathew Arnold called the saving minority. The initiative in the cantons has been sparingly used. About some of the measures adopted the people seem to have changed their minds; others have proved of doubtful value. Most of those approved by the people and which experience has proved wise, originated in the representative body. That the experience of Switzerland cannot be made the argument for the adoption of the referendum or initiative in the United States is generally admitted by Continental students of the system. Switzerland is a small State of comparatively fixed social and political conditions. Politically and socially we are in a state of flux. Experiments which may be made, and even fail, in a small political laboratory might have serious and disastrous results when attempted on a large scale. At all events, the initiative in Switzerland has not fulfilled the hopes of its advocates, and the tendency toward compulsory voting and proportional representation would probably, if realized, lead to the abandonment of the referendum.

WOODSTOCK, CONN.

Literature

From Van Buren to Lincoln

The fourth group in Professor Hart's *American Nation** includes six volumes covering the three decades from the inauguration of Van Buren to the death of Lincoln. In authorship, the group includes the editor himself, James Kendall Hosmer, Admiral Chadwick, Professor Garrison and Theodore Clarke Smith. In bulk, it is equivalent to about three volumes of Rhodes's recently completed work; whereas Rhodes himself devotes five volumes to the last fifteen years of the period in question.

In spite of its imposing array of authors and volumes the *American Nation* is only a brief survey; admirable at times, and brilliant in spots, but never narrating with any show of detail. For the general reader, however, this is no special disadvantage, since he will find twenty-six volumes of consecutive history quite as large a task as he may care to undertake. For the student or teacher, we believe that this brevity is equally of no disadvantage, for the survey is good, the book is an excellent and responsive work of reference, and its footnotes and bibliographical chapters open the door to all the source and secondary material that can be desired. As the work nears completion we feel that its editor may properly be congratulated upon the skill with which he has coordinated the labors of his corps of associates, and the high average of quality which all but a few of the volumes have reached. It were too much to demand in one group twenty-six specimens of equal, uniform and striking genius; it is a matter of gratification that all are good and that there are no very horrible examples.

In these six volumes before us, as in their predecessors, the bibliographical chapters are distinct contributions to historical workers. The handbook which Channing and Hart prepared ten years ago, and which is mentioned many times in this series, is badly out of date, and did not at best come beyond the period of the Civil War. The lists of books given here are as we want them and where we need them. They will long constitute for the serious reader the most valuable portion of the work.

Professor Hart, who has thus far appeared only as the writer of laudatory introductions, contributes the first volume of this group (the sixteenth of the *American Nation*), with the title *Slavery and Abolition, 1831-1841*. In his political survey he takes up the narrative in 1837 and continues it for a single administration. Most of his volume is devoted to the genesis of the slavery controversy and a description of the South under the institution. He speaks frankly, but with sympathy. We know of no description better, nor indeed so good. The years during which Professor Hart has lectured on the slavery question to his undergraduates at Harvard now bring their fruition in the deliberate, authoritative and brilliant picture which he here presents. His bibliography of the literature of American travel, on page 329, is of great value.

Westward Extension, 1841-1850, is the title of the seventeenth volume, by Prof. George P. Garrison. This author attempts, with some success, to emancipate his decade from the dominance of the slavery issue. We are not sure that his analysis will be final, but we remember the disadvantage under which any author of this volume must have labored. In earlier volumes Bancroft and Hildreth, Henry Adams and McMaster have been admonitory guides. Professor Garrison covers the gap between McMaster and Rhodes, and has had to add the work of preliminary organization to that of general survey. His maps are excellent and his style is good.

Theodore Clarke Smith, writing of *Parties and Slavery, 1850-1859*, has summarized Rhodes, and given a chapter on railroad building that we should have liked to see longer. His earlier monograph on the "Liberty and Free Soil Parties" has specially equipped him for this period. Admiral Chadwick's

* The American Nation. Edited by *Albert Bushnell Hart. Vols.* XVI—XXI. New York: Harper & Bros. $2.00 each.

volume, coming next, on the *Causes of the Civil War, 1859-1861*, like that of Professor Smith, is a worthy statement of what every one knows. We concur heartily in his censure of the sort of lawless fanaticism of which John Brown possessed the conspicuous example; and note errors in his north boundary of New Mexico as indicated on maps at pages 8 and 80. The last two volumes of the group, the *Appeal to Arms* and the *Outcome of the Civil War*, both by James K. Hosmer, invite comparison with works of Rhodes and Burgess, and in the latter case, at least, stand the comparison well. All of the volumes from eighteen to twenty-one are unfortunate in having to stand beside the great work of James Ford Rhodes.

An Attack on Municipal Ownership

Lord Avebury, better known as Sir John Lubbock, enjoys the high esteem of his fellow scientists. Therefore his opinions upon such a controversial topic as Municipal Ownership would be received as authoritative did we not notice that not a single economic association figures in the portentous list of his learned affiliations. Since he has not qualified on economics or sociology as he has in natural science, anthropology and antiquities, his contentions may be criticised without fear of committing the crime of *lèse majesté*.

His book,* which is an argument against what the British call Municipal Trading, he sums up by saying:

"It has, I think, been shown—

"1. That local expenditure is increasing more rapidly than rateable (taxable) property.

"2. That local indebtedness is increasing more rapidly than rateable property.

"3. That municipal trading cannot fail to give rise to awkward labor problems.

"4. That profits are only made, if at all, when municipalities have a monopoly; they are confined to businesses such as the manufacture of gas, which has long been established and reduced to regular rules; that even in such cases the accounts have been so kept as to make it impossible to tell what the real result has been; that the profit, if any, has been but small, and that much more satisfactory and remunerative results might have been obtained if the works had been leased to private companies or firms.

"5. That municipal trading has seriously interfered with private enterprise and our foreign commerce.

"6. That it is unwise to give votes to those who pay no rates, and unjust to withhold them from those who do.

"7. That by reducing the demand for labor, while increasing praises and raising rates, it has not only injured the rate-payers (taxpayers) generally, but especially the working classes; and that, if carried to its logical conclusion, it will involve the loss of their freedom."

These are drastic conclusions, important to American cities — if proven. Whether they are proven can be shown by an examination of a few typical arguments advanced in the book.

First, it is undoubted that the debts of British cities have increased enormously in the last decades. But nowhere does Lord Avebury even attempt to make a classification to show how much of this increase is due to the business enterprises which private corporations would be willing to operate, and how much to street improvements, parks, schools, etc., that all cities have more generously supplied in recent years. For education alone, which private persons would hardly undertake to finance, the debt of the English cities has grown during five years from $65,000,000 to $80,000,000, an increase of 23 per cent., and the local education tax has jumped 32 per cent. The bonded indebtedness of American cities, which Lord Avebury congratulates upon their freedom from noxious Municipal Ownership, has also enormously increased, and the budget runs ever higher and higher. Merely to assert that the cost of the government of cities is higher now than in the days of our fathers is to prove nothing about Municipal Ownership.

His method of discussing the profit and loss upon the enterprises he condemns would expose a less important man to ridicule. The amount allowed for depreciation, says Lord Avebury, regarding municipal enterprises, is too small. But nowhere does he attempt to show that cities allow less than corporations and nowhere does he mention, as he must have done had he approached the subject in the same spirit with which he studied ants, bees and wasps, that the cities keep their accounts upon a system

* On Municipal and National Trading. *By The Right Hon. Lord Avebury.* New York: The Macmillan Co. $1.50.

laid down by the Imperial Government, a system as binding upon them as upon private corporations, and that cities are legally bound to provide from earnings, before reckoning profits, a sinking fund which will wipe out the bonded indebtedness in a term of years (generally about thirty-two years). As a fact the depreciation allowance made by the cities is higher than is made by corporations, and their profits would be made to appear much larger were the profits available for dividends to financiers. The author's only authority for thinking that depreciation is not allowed for sufficiently is a writer in a 10-cent magazine, who dares to impugn the accuracy of a parliamentary return made upon the motion of a Cabinet Minister who was himself an opponent of Municipal Trading.

All thru the book Lord Avebury shows an amazing fondness for irresponsible writers and a curious shyness for official figures. One egregious example will suffice. He quotes often at length from a book by Professor H. R. Meyer, of Chicago, whom he advances as if he were an irrefutable authority on British city enterprises and on steam railroads. That Mr. Meyer never investigated the British cities upon the spot probably our author didn't know. Yet why should he leave the voluminous official documents drawn up under the supervision of the ablest permanent Imperial officers and accept, without questioning, the evidence of a Chicago advocate? In some cases Lord Avebury's gullibility is laughable. Mr. Meyer makes an important argument based on the large number of cows in Berlin, and Lord Avebury quotes the passage with gusto. At the annual meeting of the American Economic Association in 1906, at Baltimore, it was shown, in a debate with Mr. Meyer by another professor who had been to Berlin, that Mr. Meyer's statement was taken from a newspaper and was entirely false and absurd. The assembled economists chortled. But Lord Avebury gravely quotes from Mr. Meyer this fiction which Mr. Meyer copied from a newspaper; neither gentleman has taken the trouble to verify his statement by sending a letter to the vilified city.

Lord Avebury quotes again and again from the earlier writings of John Stuart Mill, bringing the authority of that great name against all public ownership; but he overlooks Mill's statement in his autobiography, written toward the end of his life, that he had changed his views and could now be classed as a socialist, his definition of socialism being the unlimited extension of public ownership.

Lord Avebury's chief remedy for the municipal invasion of the field of business is government by taxpayers. Surely he ought to know that Berlin, Vienna and other German and Austrian cities, where the taxpayers absolutely control, have gone quite as far as British cities with municipal trading. In fact, Lord Avebury is an intellectual survival of the bygone period of *laissez faire*. He sits by the wayside bemoaning that the world has left him behind, and uttering, sibyl-like, in his old age, warning of the disasters that will attend the battles which he is not aware have already been fought and won.

Correspondence of William Pitt*

THESE volumes, handsomely gotten up and edited with care, embrace 490 letters and documents, the first bearing date December 22d, 1756, and declaring that "the Dangers to which North America stands exposed have determined the King to take vigorous and effective Measures to stop the Progress of the Enemy, and to annoy them, if possible, in their own Possessions"; the last being a letter from General Amherst to Mr. Pitt, November 27, 1761, announcing that "everything in His Majesty's Government" in Canada "is perfectly well."

The germs of the mischief that in twenty years deprived the British crown of its brightest jewel lie exposed in the correspondence, and the Colonial Dames have done an excellent work in permitting documents to stand in their name on the library shelves of every country village which heretofore have been, in their main parts, subject to inspection by expert students only, and that with considerable difficulty.

Few farmers' boys even now will wade

* Correspondence of William Pitt with Colonial Governors and Military and Naval Commissioners in America. Edited under the auspices of the Colonial Dames by *Gertrude Selwyn Kimball*. Two vols. New York: The Macmillan Co. $6.00.

thru the mass of the letters of Pitt or of the colonial governors. The "simplified spelling" of some of these latter may disturb the midnight sleep of the bright boys, just as the old "Farmers' Almanac" broke the rest of Daniel Webster and his brother Ezekiel; but such will be more interested to know why, in Britain's desire to have fair play with France, she made the red man's moccasins swell with Christmas toys, and how much it cost; also why the red warriors came early to fill the moccasins, emptied them rapidly and went early home to play ball. "They are like sheep," says General Forbes; "where one leaps, the rest all follow." Their vagrant bands present in these pages the phantasmagoria of a nightmare. Gunless and naked they come to the military feast before the other guests arrive, smell the odors from the kitchen, and can hardly be prevented from battering down the doors of the pantry. When their stomachs are full, the breech cloth exchanged for a decent outfit and a polished gun, they are off—or sit on the fence wishing to be off—for the woods.

The cares of the royal governors were endless. Pownall in Boston—Boston is always interesting—is greatly troubled by "one Circumstance which is known to be a Fact, but is not capable of Proof as an overt Act, that the French have agreed with the Indians to Captivate for them a British Slave, of a particular Trade, as was the Case of a Miller."

Poor Governor Pownall has troubles also in little Rhode Island, to get them to pay due respect to the rights of neutral Spain. For the Rhodians of those days loved prize money too much, and were not averse to recovering it at some expense to Mr. Pitt's virtuous sympathies of a diplomatic character for that old-time patrol of the Spanish Main, nor were Her Majesty's judges in the marine courts always prompt in giving satisfaction of a nature to make Mr. Pitt's diplomatic relations with Spain absolutely cordial.

The love of money, moreover, was not confined to little Rhody. The Earl of Loudon wants instructions as to whether he shall accept "Plugged Gold" from that covetous "Combination of the Merchants" (of New York) "who carry on the Traffic of Money, higher than any part of the World, which they are enabled to do by the Specie having different Values in each Province." "The case of Plugging," he says, "is, when Gold does not in its Weight answer the Market the owner proposes to carry it to, he sends to the first Goldsmith, who stamps into it a piece of Metal to give it the Weight desired; the fineness of which depends on the honesty of the Goldsmith."

These are but minor points of interest in this voluminous correspondence, but they will serve as specimens to show the innumerable side issues that enliven the letters of the Governors and add to the ample details already known to the makers of histories—details of those splendid victories in war which terminated on the Hights of Abraham so tragically to the two great leaders, Montcalm and Wolfe, so satisfactorily to the shivering colonies, so gloriously for the British crown.

Life in Ancient Athens. The Social and Public Life of a Classical Athenian from Day to Day. By T. G. Tucker, Professor of Classical Philology in the University of Melbourne. New York: The Macmillan Co. Pp. xiii, 323. $1.25.

The author does not aim to supersede books on Greek life and monuments in general. He limits himself to life in Athens, and to Athens in one great century, in round numbers, 440-330 B. C. The first thought of classical scholars will perhaps be: "Haven't we enough books already about life in Athens without going so far as Australia to get at this late date more light on the subject?" But the author has succeeded in producing a very interesting book out of material that has been handled again and again. He has put a thrill of life into it. We may think as we turn over a page: "Now we have something trite"; but we are at once caught by a new presentation of a subject that has once bored us, but does not bore us now. Two features are prominent: (1) Emphasizing essentials while sprinkling in minutiæ in an offhand way; (2) the "familiar but by no means vulgar" description. Humor bubbles up from time to time. The author takes a moment to score the pedagogs who deal out to the boys phrases alleged to be English. Pedagogs of half a century ago were afraid to call a spade

a spade, because it was not high-toned enough to be classic. Sometimes the author makes you feel that he is going to drop into slang. *"Es ist so schwer den falschen Weg zu meiden."* But he comes out, on the whole, victorious, and his readers of every class will know what he means. We must like him for phrases like "the austere and depressing Sparta," "modern civilization alleged to be Christian," and "the visible justifier of your existence," the latter referring to a patron whom every Metic, called here an Outlander, was obliged to choose as a guardian. Perhaps there is a little striving after "modern instances," and yet how apposite is the parallel between the Scythian policemen at Athens called Speusippoi, from Speusippos, and the English "Bobbies" or "Peelers," named after Robert Peel. Nothing could be more lucid than the chapter on Outlanders, Slaves and Women. Here is a picture of a poor citizen working at the same bench with another man of the same blood, wearing the same dress, and yet one has an equal vote with the best man in Athens, while the other is a slave, and would be scourged if he were caught presenting himself at the Assembly. It is perhaps ungracious to note errors. But Paul never told the Athenians that they were "too superstitious," but "very religious." Nikias's 1,000 slaves worked in the mines of Laurion, not in Thrace. Temples were not lighted by openings in the roof. The large door when opened gave all the light required. The Panathenaic procession did not move *down* from the Kerameikos into the city, but *up*. But these are mere trivialities. What are they compared with the Attic salt of the author which leaves a pleasant taste?

The Second Generation. By David Graham Phillips. New York: D. Appleton & Co. $1.50.

By *The Second Generation* the author means the fashionable children of those rich, simple-hearted, old trust makers who were once barefooted country boys, but who now own the country on the instalment plan. The initial chapters show how Harvard University makes the sons snobs just as Butterick's patterns give country girls a funny half-fashionable look, and how the daughters are expected to "set a pace" by marrying well. The conversation of the characters is meant to indicate the social cowardice from which they suffer, and the ravenous greed which wealth generates in such circles of society. And having showed how bad, how ignoble things are, Mr. Phillips proposes a remedy which makes a good story, but which could never be applied in real life. He thinks the honest old trust maker should leave his fortune to, say, an eleemosynary institution, thus giving his children an opportunity to become useful members of society. In this particular case the rich mill owner gives his money to a university. Then Mr. Phillips takes things in his own hands. He arranges the hours of the university and the few working hours of the mill so that the mill hands may all take the scientific course. He admits that the dividends of such a concern would not be large, but in a community where everybody is rich by free grace and for nothing there will, of course, be no need for dividends. The idea is very plausibly developed, and it is interesting to see how happily he marries everybody who deserves happiness by being poor. But, on the whole, the book teaches us to be thankful that the social and industrial salvation of the country is not in the hands of these ingenious fiction makers, particularly those who have a socialistic heaven in view which none of us are fit by nature or grace to enter.

Thomas à Kempis: His Age and Book. By J. E. G. De Montmorency, B. A., LL. B. New York: G. P. Putnam's Sons. $2.75.

Saint Catherine of Siena and Her Times. By the Author of "Mademoiselle Mori." New York: G. P. Putnam's Sons. $2.75.

The renewed interest in mysticism, which is one of the prominent features of the religious life of these times, lends timeliness to these careful biographies of two of the most famous saints of the medieval days. Mr. De Montmorency devotes considerable space to consideration of the much mooted question of the authorship of the "Imitation," and decides in favor of the traditional Thomas Haemmerlein, of Kempen. Early manuscripts and editions of the famous treatise are described at length. The relation of the "Imitation" to the thought

and life of its time, and its great influence upon subsequent Christian piety, are handled skillfully. Miss Margaret Denise Roberts, who is the "author of 'Mademoiselle Mori,'" brings a large store of knowledge and no small literary skill to her congenial task of portraying the saintly, but practical, and "very human" Catherine of Siena. The most distinguished woman saint of the Dominican order lived a highly useful life of varied peace and conflict, and doubtless Miss Roberts's verdict is just, that she was "one of the three greatest figures of the fourteenth century." History has thought kindly of Pope Pius II for his declaration at the canonization of Catherine that "none ever approached her without going away better," and like benefit is certain to accrue to all who read the story of her life in the fascinating, scholarly and sympathetic biography by the Welsh lady who has devoted herself so assiduously to things Italian in the fourteenth century. Both this biography and that of the author of the "Imitation" are exceptionally well printed and illustrated, the illustrations in both cases being calculated to instruct as well as to adorn.

Literary Notes

....Prof. Alfred E. Garvie, of London, who is known for his excellent treatise on the theology of Ritschl, is the author of *A Guide to Preachers*, based on instruction given to lay preachers in a London Congregational Church. The book is very practical and sensible, and of a higher order than many works of its class. (A. C. Armstrong & Son.)

....Every housekeeper has to deal with refractory spots and stains of various kinds. She will find good advice in *Spots, 202 Cleansers*, by Clarice T. Courvoisier (Paul Elder & Co, N. Y. 75 cents). The only stains that seem to have been left out are the spots of ink and muck upon political reputations. Every other possible spot seems to be erasable.

....Those persons who are trying to climb their genealogical trees will be glad to know the Director of the Census is publishing original records of the first census containing the names of all *Heads of Families* and other information. The pamphlets for New Hampshire, Vermont and Maryland are now in press and will be sold by the Bureau of the Census at Washington at $1 each.

....An attractive little volume, bound in the blue and white gingham we associate with kitchen aprons, is issued by G. P. Putnam's Sons. The author, Olive Green, tells how to make *The Thousand Simple Soups*. We wonder why it was not made "One Thousand and One," but blank pages at the end leave space for the cook to add her favorite soup to the long and appetizing list. (90 cents.)

....*The Blue Book of Missions for 1907* is happily described by its title. It aims to be a handy volume of facts and figures regarding all missionary work thruout the world, both Protestant and Catholic. It contains information concerning the officers and incomes of the various missionary societies as well as summaries of work on the field. (Funk & Wagnalls. $1.)

....The Gifford Lectures for 1904 and 1905 were by Prof. Henry Melvill Gwatkin, of Cambridge, and are published under the title *The Knowledge of God and Its Historical Development*. (Imported by Charles Scribner's Sons. 2 vols. $3.75.) The lectures attempt both a history of the principal forms of theistic belief and also a justification of the theistic interpretation of the world. Professor Gwatkin may be remembered as the author of some very pleasing sermons entitled "The Eye for Spiritual Things."

....Paul Elder & Co., New York, publish *Ye Gardeyne Boke* ($1.50), a collection of poetical passages about flowers and gardens, from various English authors, with ornamental borders. While no attempt at completeness is sought, not a few choice passages are included. We miss others more choice than most of those given, such as Milton's beautiful list of flowers in "Lycidas," Spenser's lovely description of the daisy in the "Dream of Fair Women." Indeed, Burns's little tribute is not included, nor Wordsworth's to the violet or the celandine, nor do we find

"That fateful flower beside the rill,
The daffodil, the daffodil."

But to include all were impossible.

....*The Preliminary Check List of American Almanacs*, 1639-1800, by Hugh Alexander Morrison, of the Library of Congress, as issued thru the Government Printing Office, at Washington, is crowded with information regarding old almanacs. A very large number of these publications originated in Connecticut. A still larger number were published in Boston, and some other places in Massachusetts. New York was a prolific publication center, but possibly the most interesting almanacs to which reference is made were those printed in Pennsylvania. Some of the Pennsylvania almanacs were printed by William Bradford. Others bear the imprint of Andrew Bradford, while still others are marked B. Franklin. These include the famous "Poor Richard" almanacs. Other printers of the Pennsylvania almanacs are Christopher Saur, the famous German printer, and R. Aitken, as well as hosts of others whose names are not so well known. Many of the almanacs described, and doubtless some others, still exist, and the publication of a check list will do something toward the discovery of almanacs now unknown.

Editorials

Tariff Revision

An approaching attack upon the new commercial agreement with Germany promises to stimulate general discussion concerning the need of tariff revision. On the face of this agreement, Germany surrenders $6,664,000 per annum in duties which her laws permit her to collect upon imports from the United States, but receives in return a reduction of our duties on imports from Germany which amounts to only $208,168. Her concessions affect nearly 97 per cent. of the goods we sell to her, while less than 1½ per cent. of the goods she sells to us are touched by the reductions ordered on our side. It is scarcely conceivable that a trade agreement was made upon these terms alone, and therefore we must consider the value of additional concessions, outside of the tariff rates, that have at the same time been made by the United States. Are they sufficient to counterbalance the apparent annual advantage of more than $6,000,000? That remains to be proved in practice.

Of these additional concessions, the most important relates to our appraisal of the market and dutiable value of those goods imported from Germany upon which our duties, as fixed by law, are percentages of value. Many German manufacturers have export prices which are considerably lower than their prices for domestic consumers. Some of our own highly protected manufacturers and combinations of manufacturers have been accustomed to sell for export at prices much lower than those which they require Americans to pay. Steel rails, watches, nails, ship plates, etc., are among the products that have been thus sold to buyers abroad. But the practice is an older one in Germany, where evidence as to the prevalence of it has been shown repeatedly in the reports of the manufacturers themselves. This new agreement has called for the following instructions to our customs officers:

"Market value, as defined by Section 19 of the Customs Administrative Act, should be construed to mean the export price, whenever goods, wares and merchandise are sold wholly for export or sold in the home market only in limited quantities, by reason of which fact there cannot be established a market value based upon the sale of such goods, wares and merchandise in usual wholesale quantities packed ready for shipment to the United States."

Certain intense protectionists among us, who have never protested against our own sales at low prices for export—such sales, for example, as have led Canada to guard against them by special laws—now assert that obedience to these instructions will lower our tariff wall. The German manufacturer, they say, can now easily get a low dutiable valuation by preparing goods "for export" in some special form or package, and by fixing the price, or market value, to suit himself. Which may, or may not, be true. Unquestionably, however, the tendency of this part of the new agreement will be to make the dutiable value of some imports from Germany lower than it has been.

Other accompanying concessions, the reasonableness of which we are not now questioning, will tend to affect dutiable values in the same way. The testimony of German Chambers of Commerce is to be accepted as evidence that is competent, but not necessarily conclusive. Confidential agents sent abroad to investigate as to values and undervaluations must go openly, be accredited to the German Government, and co-operate with the local Chambers of Commerce. Each agent must be *persona grata*, if he is to continue in the performance of his duties. No room for spies. There is to be a relaxation of the requirements concerning statements made to consular officers. Hearings here on re-appraisements are to be open. Some say that recent open hearings have been quite satisfactory. Others assert that such information as has heretofore been given to agents and appraisers in confidence by importers and other merchants will be withheld hereafter if it is to be made public, with the names of those from whom it comes. It

seems just, however, that an importer accused of cheating the Government should be confronted with the witnesses against him.

As we have said, the tendency of these changes will be to make dutiable values of imported goods lower than they have been. Other nations are demanding similar concessions, and they must be granted. By the way, England asks for the reduction of rates—on argols, wine, brandy, paintings and statuary—which has been granted to Germany, and is told, so it is reported, that she cannot have it because she has nothing to give in return. Why nothing? For the simple reason that she has given everything already by admitting all our goods free of duty!

If the new regulations are just and reasonable, and if they are to reduce dutiable values and duties, have these values and duties heretofore been made unlawfully high? Have the rates of an extremely high tariff been made higher by unjust and vexatious rules? We trust that these questions will be answered for the public in the discussion which will accompany the Protective Tariff League's assault upon the new agreement with Germany.

A revision of the tariff must soon be made. Protected manufacturers demand it. At the recent meeting of the National Manufacturers' Association, an organization having 1,800 members, there was passed by unanimous vote a resolution in favor of revision "at the earliest practicable date." Even Congressman Dalzell, of Pittsburg, who opposes revision, predicts that next year's Republican National Convention will say in its platform that the tariff should be revised immediately after the Presidential election. This, he remarks, will be a concession to a popular sentiment which the Republican party leaders cannot afford to ignore. It is reported that the President will send to the Senate in December an elaborate treaty of reciprocity with Germany, and that similar treaties with several other nations may go with it. Such agreements, however, whether ratified or rejected, will merely lead to a general revision, the fruit of which will probably be a new tariff of maximum and minimum rates.

As Some Employers See It

WITHIN limits this is a free country. It might be a good deal freer and nobody be the worse for that. Believing in freedom, we are always glad when the men with whom we most profoundly disagree freely speak their minds. That is a relief to them, and it gives us information.

We profoundly disagree with the gentlemen who believes that the good Lord picked them out from the general job lot of human beings to represent His particular view and policy on the subject of mundane welfare, and consigned the rest of us to their hands for admonition, tutelage and such income as they think is good for us. We profoundly disagree with those employers who, when they wish to scale down wages, think it necessary to argue that wages are in general too high for the best interest of the "working class." We should admire them much more if they frankly remarked that, being dissatisfied with their own incomes, they had decided, whether or no, to squeeze a little more of work per dollar from their labor force. That at least would be taking the moral responsibility for their own conduct, instead of transferring it to the broad shoulders of Providence.

Nevertheless, so long as they enjoy thinking of themselves as on the whole better, abler and more congenial to the high and mighty Ruler of the Universe than their fellow beings are, we are glad to have them say so. Their confession of faith enables us to know just what to expect from them under given conditions. It prevents misunderstandings and disappointments.

The other day there assembled in this city a distinguished body of gentlemen known as the National Association of Manufacturers. They were good American citizens, deserving well of mankind, very well drest, and good judges of Mr. Boldt's culinary department. All of them, it is safe to say, had had their trials and disappointments in life, but all of them had arrived at that measure of solvency which enabled them to feel a reasonable degree of assurance that their wives would not have to open boarding houses or accept positions as salesladies in department stores, and that their chil-

dren, under school age, would not have to be put at work in the sweatshops of New York or the cotton mills of North Carolina.

Under these circumstances, we think that, just as a matter of taste, Mr. Van Cleave might have modified his presidential remarks on the subject of child and woman labor. "There has been an increase, of course," he said, "since 1900, but most of the lamentations on this subject are extravagances or distortions, and are based on ignorance or mendacity."

Now it so happens that most of the lamentations on this subject have proceeded from the National Child Labor Committee, most of whose members, we venture to remark, are somewhat better known to the general public than Mr. President Van Cleave is. It appears, therefore, that Mr. President Van Cleave has raised a question of sound judgment and veracity as between himself and such men as Senator Beveridge, Dr. Felix Adler and Professor Samuel McCune Lindsay. He will, therefore, excuse us, we hope, if, being by him driven to this unpleasant necessity, we are forced to decide that we believe the statements of Messrs. Beveridge, Adler and Lindsay.

We do not doubt that Mr. President Van Cleave and his associates are entirely sincere in their contention that "rightly conducted, and so long as it does not interfere with their proper education, work benefits children as it does adults." In view, however, of what we believe to be Mr. President Van Cleave's mistaken judgment of the relative accuracy of himself and the National Child Labor Committee, we beg to offer the suggestion that he and his associates could do worse than consult the National Child Labor Committee as to how employers should rightly conduct the labor of children so as not to interfere with their proper education.

The Zoöphilists

By zoöphily we do not mean the spirit of the campaign against vivisection; we have in mind rather the larger view, which loves animals and which studies their instincts and the higher reaches of their conduct which seem to imply a measure of reason. We mean by zoöphilists the men who love to investigate the traits and habits and activities of the lower animals. And we have in mind those writers who try to make animal life interesting to us by showing what is the kinship of the beasts to man; for we have long ago learned how near men may approach the beast, if they do not even fall below the beast. The normal hight above measures the possible fall below.

As the artist Beard used to love to draw figures of bears which were almost human in expression, so Kipling, in one of his most famous works, "The Jungle Book," in the frankest way put full human reason into the brutes, and at the same time gave us a fellow feeling for them. Other writers, following him at a considerable distance, and claiming to keep within the limits of possible truth, have told stories in which beasts were the characters, and their loves and hates, their hunts and their escapes, were made the substance of the tale. Yet others have claimed to tell what they had seen or known of the law of the pack or the wiles of the wild, and wonderful are the stories they have narrated.

Now John Burroughs says they are not to be believed, that they exaggerate or invent, and that thus they deceive their readers, whose gullibility would justify applying to them the term which a countryman applied to a company of students whom Agassiz was once conducting thru the White Mountains. Every little while they would jump from their stage to examine a flower, or to catch a butterfly, or to inspect a stone. Their conduct was so strange that a passer-by asked who they were, and the driver answered that they were "a company of *naturals*, and that," pointing to Professor Agassiz, "is their keeper." Mr. Burroughs thinks that those who would believe such stories are born simpletons, and President Roosevelt, after his custom, puts the writers into his Ananias Club.

But Mr. Long, one of those thus stigmatized, will not for a moment accept his card of membership. On the contrary, he asserts stoutly that whatever he has said is true, and he calls on Mr. Roosevelt, not as President, but as a

gentleman, to prove his charge or to withdraw it. He brings, in a long article in the papers, evidence to support his remarkable stories of animal sagacity, and he makes a very strong case. But we do not choose to enter into this conflict, in which only the best experts have the right to speak. We prefer to utter ourselves on a side issue.

Mr. Long plumply denies that President Roosevelt is a zoöphilist, or that he knows much about the character, conduct or genius of animals. How can he? says Mr. Long. Has he ever, so far as we know, spent days or hours in following and watching and keeping company with the beasts alone, so as not to frighten them, and, armed only with a spyglass and a photographer's kit? Instead of this, says Mr. Long, he has chased them with dogs and killed them with his gun. What story can a dead bear or elk tell Mr. Roosevelt? Will he learn anything of its nature when it is rushing in frenzied flight to escape a pack of baying hounds? The one thing that the hunter is after is to shoot, to kill. He does not care to know the heart of the brother beast, but only to change the living animal into dead meat. That is no way to study the animal. A person does not become a naturalist in that way.

Further, it is not a noble kind of sport. It might even be called brutal. The hunter is no zoöphilist. What a brutal sport is that described in THE INDEPENDENT this week of the hunts in the preserves followed by the French Presidents. Small animals were bred till they were tame. They were then driven before stands where the hunters, with almost no effort, could shoot them as fast as loaded guns could be past to them. Can a humane man find enjoyment in such sport? The hunting of large and dangerous animals in the wild forest is more exciting, and requires energy and courage, but it is equally barbarous, except as it is done to rid the world of ferocious beasts dangerous to human life. We make no cry against those who hunt the man-eating tigers of India, but what shall we say of those whose pride it is to kill elephants or moose or caribous?

It is the true sportsman, with spyglass and camera, who is competent to tell what is in the heart of the beasts. That they are very human we are willing to believe. We may listen to the protest of John Burroughs against the extraordinary tales of Mr. Long or Jack London, but not of the mere chasers and shooters. A late number of the London *Spectator* tells of the jealousy exhibited by a big Newfoundland dog at the attention paid to a small dog visiting the house. He took the little fellow very courteously on a walk, but when he came near a stream, as they stood peaceably together, the big dog suddenly seized his companion by the neck, bit him cruelly, carried him into the stream and held him under the water to drown, till he was driven away by a passer-by. There was jealousy, hypocrisy, treachery and cruelty. It was an act of human contrivance and reason, what we would call in a man malice prepense. The nature writers hardly tell more incredible stories than this.

Congregationalists and Tri-Church Union

UP to the past month or two there has been very little objection raised by Congregationalists to the proposed union of the three denominations, Congregationalists, United Brethren and Methodist Protestants. It seemed as if it would be approved by common consent. But now several leading city churches have voted to disapprove the terms of union proposed in the so-called "Act of Union." The State Conferences which have met have either heartily approved it as it stands, or have warmly favored the effort at union but suggested careful consideration of its terms. We may presume that the union is assured, as far as Congregationalists are concerned, altho it may be necessary to make some points of liberty more definite in order to secure unanimity. The most careful statement of the grounds of opposition is that made by William Ives Washburn, Esq., of the Broadway Tabernacle, New York City, and read to the New York State Association, and now published for distribution. It is a lawyer's plea, and states, by way of introduction, that it is based wholly on the language of the "Act of Union," "pure and simple," and it is assumed that in its future interpretation no "report of

any committee," and no "statements or understandings outside of its provisions" will have any weight. That is certainly a wrong view. The Constitution of the United States has to be interpreted by the known intentions of those who adopted it, as learned from "The Federalist" and other writings.

Mr. Washburn's paper begins by saying that the Congregational delegates to the Tri-Church Council were largely "self-appointed." That is an error. They were appointed by the authority of the National Council, and in the way it directed.

The first objection is against giving up the name *Congregational*, "with all its historic associations." The name as applied to the churches is scarce a hundred years old, and as an official name it is not forty years old.

Next we are told that the "Act of Union" is "loosely drawn." That is a merit. It gives liberty, which was intended.

Then comes the assertion:

> "In one respect it is perfectly clear. The local independence, or autonomy of the churches, which is the fundamental principle of our system of government and administration, is absolutely surrendered."

There is not one word in the "Act of Union" to justify this statement. To support it the writer refers to a previous draft of a plan. But he had just told us that no other document was to be considered, only this. He quotes a passage in the draft approved at the previous meeting at Dayton, on the subject of the freedom of the local church, and says this clause was struck out "after debate." It is a mistake. It was never discussed even, for the whole Dayton draft was dropt, and a new draft considered in its place. It is true that in the new draft a clause about autonomy of the local church was left out, because it was not desired to impose autonomy on any churches that might not like the term, but the fullest autonomy was left to those churches that believe in it. Equally the term *connectionalism* was left out, but liberty for it was also provided, that any conference of churches may continue as it is, and retain its customs "intact" as long as it chooses. There is not in the "Act of Union" one word which limits the autonomy of the local church. Churches are not required to submit in any way, beyond what they choose, to the authority of any superior body.

But the writer says that "a common declaration or creed for all the churches" is "imposed upon the churches," to take the place of their several local creeds. There is not a word of the sort in the "Act of Union." There is no provision to make this new declaration of the common faith mandatory by trial for heresy upon it. It has precisely the weight of the "Burial Hill Declaration." It is an act of worship.

The writer further objects that autonomy is vitiated by the provision that the Annual Conference shall define the "boundaries, composition, duties and prerogatives" of the district associations. That is not terrible. It has to be done somehow, and is done now. The writer complains that the district associations have "power to make rules and regulations for the conduct of all their local affairs." Of course they can make their own rules and do their own business, for they have their own autonomy. He says "it is easy to see how this will be construed by the United Brethren and the Methodist Protestants in regard to the internal affairs of churches now connected with their conferences." Certainly. Why should they not construe it to suit themselves, and why should not Congregationalists do the same in their conferences? That is liberty and autonomy.

Again it is objected that nothing is said about councils for ordination, etc. If so, then they are not forbidden. They will continue as of old just as long as they are wanted. Equally under our National Government, the States, counties and towns retain all rights that are not specifically given to Congress.

These are the principal objections raised by Mr. Washburn. The main complaint is that the "Act of Union" is not definite and full enough. It leaves too much to liberty and choice of interpretation and action. In our view that is an excellence; but if it would satisfy him and his church that it be definitely stated that it can keep its local Congregational name and its local "autonomy" undisturbed, we see no reason why their

fears should not be considered. For our part we do not fear that Congregationalists will suffer the loss of liberty in a united body in which their membership will be 200,000 greater than that of the two other bodies combined. In the union there is no danger of "domination" by any body, because nobody wants to dominate. There must be mutual faith for union.

The Science of Eating

A SCIENCE begins in a humble spirit, spending a generation or more learning before it assumes a masterful tone. Botany began by studying and classifying all discoverable varieties of plants; now it is creating new plants. Zoölogy is passing thru similar stages only a little behind. The science of nutrition also laid its foundation in the same orderly and stable fashion by devoting a quarter century to the study of the food habits of mankind before it presumed to criticise them. The so-called dietary standards which have resulted from this study are merely the averages of well-fed classes in various countries. Their sole authority was based upon the assumption, not always so definitely expressed and constantly kept in mind as it should have been, that when a person was not limited in his diet by poverty he would instinctively eat the proper things at the proper time and in the proper amount. But instinct, as we know, is a very fallible guide, especially in the case of man, who has shielded himself against that merciless competition and destruction which trains instinct in safe paths. To confuse the customary with the optimum is the fallacy of conservatism.

The established dietary that prevails, with only minor modifications, all over the civilized world has been challenged by many individuals, who have generally been willing to offer themselves as living proofs of advantages of their own particular food reforms. But as the experience of an individual in such matters is very inconclusive, and as the arguments they use are mostly theoretical or sentimental, and indeed, often patently absurd, they have not succeeded in convincing the physiologists or in converting the people. Now, however, the "standard ration" is being subjected to a more formidable attack by modern weapons of precision. Professor Chittenden, of Yale, has just launched against it a solid volume, "The Nutrition of Man," filled with the results of his experiments on dogs, students and soldiers. His conclusion is, in short, that people generally eat too much, and especially too much meat.

It is particularly about the question of proteid that the battle rages. This is the only form in which the body can get the essential element, nitrogen. We can therefore accept no substitute for it, while the other two components of food serving as fuel, the carbohydrates (sugar and starch), and the fats, can replace each other or be replaced by proteid. But the proteids are the most expensive of foods, especially under the reign of the meat trust, and also the most troublesome, for their waste products are difficult to eliminate and often the cause of disease. It is important, therefore, to know how little proteid one can get along with. Voit's standard, based on the study of German dietaries, gave 118 grams of proteid and a total of 3,055 calories of energy as the requirements of an average man weighing 70 kilograms and at moderate work.

In America, under the Department of Agriculture, some 15,000 dietaries have been calculated, and from them Atwater deduced a standard of 125 grams of proteid and 4,150 calories. Chittenden now finds by actual experiment that 60 grams of proteid and 2,800 calories is sufficient to keep up health and strength.

Professor Fisher found that the Yale students who under his direction adopted a diet low in proteids increased greatly their powers of enduring severe muscular exercises. In these experiments no restrictions were imposed on the choice of food, but the Fletcher method of mastication was employed—that is, the food was chewed until swallowing was involuntary and unconscious. Mr. Fletcher insists that the demands of the palate and the stomach are not irreconcilable; that we can get more fun out of eating a little if we put our mind on it than by inattentively swallowing a great deal. He gave a triumphant demonstration of the economy of his method by

living at the Waldorf-Astoria at half a dollar a day for meals, probably not including the waiter.

But Horace Fletcher is a natural prodigy, anyway. When he was confined in the air-tight chamber of Atwater's calorimeter he apparently gave off more heat and mechanical energy than was supplied to him in his food. Anybody meeting Mr. Fletcher and hearing him talk on his hobby would perceive that he is overflowing with energy; still, no man has a right to interfere with the law of the conservation of energy in that way. It is bad enough for him to upset the traditional laws of dietetics. Unless there was some mistake in the figures, the only way we can account for the calorimeter experiment is by assuming that he has a few grams of radium in his bones. What a handy thing this radium is! How did we ever do without it?

Of course the startling conclusions of Chittenden, Fisher, Fletcher and others are meeting with some criticism as well as much incredulity. Probably the most important experimental evidence to be brought against them is the experience of the Japanese. They have experimented for a few thousand years on a low-proteid vegetarian diet, and for the last twenty years under the direction of scientific experts in the army and navy on a mixed meat and vegetable diet approximating the conventional food standards. The result is strongly in favor of the latter. The old ration of the common people, chiefly rice, was very close to that recommended by Professor Chittenden, but Manchuria was conquered on 150 grams of proteid and 3,000 calories. Under the old regimen a third of the marines suffered from beriberi, but under the new this disease practically disappeared. Professor Chittenden argues, however, that the fault of the rice diet was not its insufficiency but its lack of variety, failing to supply some essential unknown element.

Digestion is the most complicated set of chemical reactions ever studied by man and it will be a long time before our diet can be dictated with unimpeachable authority. But we are all interested to know that the latest researches prove that it is possible to maintain the body in perfect health and vigor on half the meat and two-thirds of the total food now eaten by the average man, and they strongly indicate that it would be better for us to limit ourselves to this amount. They also indicate the importance of using the mouth as part of the digestive apparatus instead of as a mere funnel to the throat. The stomach has no teeth. If the mastication is thoro both the regulation of the quantity and selection of the proper kinds of food will need no attention. Fletcherism is a sort of Peter's vision showing us that nothing is common or unclean. It is of more importance how we chew than what we eschew.

Ex-Governor Northen's Work in Georgia

WATCHING with keenest interest the reconstructive movements in Georgia, reactionary from the recent Atlanta riot, we have noted with pleasure the spread of that wing of the movement led by the Hon. W. J. Northen, who for four years was Governor of the State. Tho already seventy he has up to this time traveled thru over one hundred counties of the State, organizing his civic leagues. The object of these organizations is to prevent rape and stop mobs. To this end he is uniting the best men of both races to control the bad of both races.

Two illustrations will show how this works. When he arrived in one of the towns where he was to organize a league he found the town in the grasp of a mob which was trying to lynch a negro charged with rape of a white woman. One of the leading white men of the town held the mob at bay and prevented a lynching. Later, in the organization of the league, this man was put at the head of it. The other shows how the colored people are co-operating. A negro was caught entering a lady's room; he was shot at and wounded, but escaped. The colored people discovered him and turned him over to the authorities. A league had been organized in the town.

In his addresses to the people ex-Governor Northen is making a significant confession. He says that every Southern Governor has an ambition to be United States Senator at the expiration of his term. Realizing this he is

tempted to dwarf his official manhood to secure votes. He recognizes that the members of the mob have votes in their pockets, and that the victims of the mobs do not. He confesses to have had this Senatorial ambition himself, but realizing the official prostitution it required put it away. He was the first Governor of the State to offer a reward for a mob that lynched a negro, and he exhibits in his addresses some gruesome relics sent him by mobs in consequence of this stand.

This declaration logically puts the ex-Governor in opposition to the proposed scheme of Hoke Smith and his henchmen to disfranchise the negro at the forthcoming term of the Legislature this summer, when Hoke Smith is inaugurated. The official organ of the Governor-elect, foreseeing this, has begun to attack ex-Governor Northen, and the latter has retorted with spirit. And yet the promoter of the civic league movement refuses to take a stand on the question of the ballot, saying he does not care which way the matter turns.

While this may be good policy on the part of former-Governor Northen, yet it reveals one of the weaknesses of these reconstructive movements. Ray Stannard Baker, in his discriminating article, "Following the Color Line," in the April *American,* pens this trenchant sentence:

"These movements do not cover specifically, it will have been observed, the enormously difficult problems of politics and the political relationships of the races nor the subject of negro education nor the most exasperating of all the provocatives—those problems which arise from human contact in street cars, railroad trains, and in life generally."

Mr. Baker has laid his finger on the weak point in these movements, and yet we should be willing to allow them to start with a narrow purpose ostensibly in case there is constant progress to a more comprehensive goal. Certainly these movements should have some effect on the approaching contest to take away the black man's ballot. The social disorders of the South can never be rectified without giving the black man the elective franchise; and we hold that there should be no restriction on the ballot, that is not honestly applied to black and white alike. We do not care to confess an inferiority of the Saxon to the African by putting more stringent regulations for voting upon the latter than the former. Nor do we think our Southern brethren will long like to stand in that light before the civilized world.

We regret to hear that the temperance people are aligning themselves with this disfranchisement scheme of ballot-box theft. They allege that once the negro is disfranchised it will be easy to vote out liquor. We are confident this is uncalled for. We base this confidence on assertions of colored men like H. H. Proctor, who, in a recent gathering of whites, told that at least three-fourths of the colored voters would stand for prohibition in Atlanta. This assertion seems reasonable when it is considered that the lower element of the race is already practically disfranchised in Georgia by the tax delinquency regulation, and that the better element of the race who would vote have been trained in schools of temperance for the most part and are the church-going element bred to sobriety. The best recent verification of this is seen in the case of the prohibition election in Knoxville, Tenn, where the majority of the colored vote went for prohibition.

But to return to Mr. Northen's campaign. It is likely to go down in history. What the South has needed is a man who is not afraid to call a spade a spade with respect to its pet sin, the negro question. Returning from his campaign of a hundred counties in Georgia, he addressed the white Evangelical Ministers' Association of Atlanta somewhat as follows:

"The white people hate the negroes and the negroes hate the white people, like they both do the devil." . . . . "There is a deep grained antagonism existing between the two races, and, where the negro is concerned, the white people are all ready to cry with Ben Tillman: 'To hell with the law.'

"This spirit has existed in high places, and is alive in the courts. I recently wrote to members of the Supreme Court, asking if they did not consider lynching nothing less than murder. I failed to get an answer, and it was the same way with regard to the sheriffs.

"I believe every one of a mob a red-handed murderer, whether he be the tail end member or a leader, and it is my opinion that all people connected with a lynching, whether they be only onlookers or not, should be sentenced to serve at least five years in the penitentiary.

"I consider people who burn negroes as savages hot from hell.

"Many are trying to belittle this negro question, and say it would be better not to agitate it. It is greater than all the other problems combined, and should have every Southern man's attention. Just now we are lapsing into barbarism, and our civilization is slipping from us. Something must be done."

This unique campaign of ex-Governor Northen is sure to bear fruit. "We shall never settle this question until we give absolute justice to the negro. We are not now doing justice to the negro in Georgia." Who could say this better? "Get into contact," he says, "with the best negroes; and there are plenty of them."

Penguin Poets

THIS is the season of the year when many young people mistake the poetry of Nature for their own. They withdraw from commonplace occupations and devote themselves to the muse, not because they have any poetic faculty of their own, but they are passing thru the verse-making stage of adolescence, and are on this account peculiarly sensitive to the sweetness of the June song which the earth is making now to the heavens with her lyrical meadows and soft wind tunes. During the past few days twenty-two of them have submitted verses in various stages of composition. Each appears to write with clinched fists and staring eyes, as if the poetic temperament was a kind of neurosis, and all express the expectation of one day becoming "great." But not one of them submits a line which justifies so much ambition.

Now it is not so bad not to be a poet, but it is thinking you are when you are not that is bad, because it puts you "out of drawing," on the topmost bough, so to speak, with no song to sing—a very awkward position. And it is with the hope of helping these young penguin poets back to the ground where they belong that we give the following suggestions and advice. We shall not discuss either poets or poetry, but with all gentleness we shall attempt to separate the penguins from the larks with descriptions sufficiently accurate for them to recognize each other in the future.

The first of the poems already referred to is from a Western youth. He writes that he was awakened in the middle of the night so overcome with the poetic frenzy, altho he had never written any before, that he was obliged to rise, light the candle and write it down. The next morning he discovered that he had composed a "Dirge for the Dead," heaven help us! Why do the very young suffer from these melancholy emotions? It is not poetry, but it is undoubtedly a dirge. The author thinks that he had a miraculous inspiration; as a matter of fact he had a nightmare. By no stretch of poetic license may the hobgoblin verses which usually result from such sources be called poetry.

Naturally most poets pass thru the parrot stage of development when they imitate their betters, as the young eagle is said to make his first flight perched upon the old eagle's wing. But the latter never repeats the plagiarism; after that nothing can prevent his risking his own wings above the bosom of the winds. This is true inspiration. So the young poet may begin by putting his callow words to a great tune; but if he persists in clinging to the wing-bone of Tennyson's genius, for example, this is a sure indication that he should cease to persecute the muse and take to plowing —plowing, because next to writing poetry it is the most poetic of all occupations.

The disposition to hawk the heavens upon another's wings is characteristic of these penguin poets. One of them urges the acceptance of his verses upon the grounds that they are "as good as 'Thanatopsis!'" They do indeed have a mournful dum-dum sound which recalls the solemn measure of Bryant's poem, but the sorry words carry no dignity of meaning.

This brings us to consider the gravest limitation of the penguin poet—rather, the evidence of it—that is, his use of words. He really belongs to that class of people who begin their prose with "It is said," etc., and they never get beyond what has already been said. They would regard it as a kind of intellectual boisterousness, unseemly and dangerous. So the penguin poet never recognizes the fact that words, like other garments, get old and dingy and out of the fashion.

This reflection is made especially with reference to the young man who sends us the verses on the "Monarch Oak." That tree title belongs to the days of crowns and kings. It does not mean much now; it is out of the very fashion of the times, because crowns and kings are at a discount. There is, of course, the best of reasons for retaining the oaks in poetry, but it would be better if the penguin poets could be induced to call them "old-man-Merlin trees," referring to the past, or "magnates of the forests," referring to the vulgarized financial present. This would at least insure a rest from a decrepit figure of speech. Here is the point: If you cannot reclaim the poor old mendicant word that goes a-begging from every common man's tongue, and set it newborn, full of fresh enchantment both of music and meaning, do not persist in trying to write poetry, but be contented with some literal-minded employment, like tabulating census reports. This is not an ignoble business and may do some good, but it is certain that your verses will not.

And it is astonishing how ignorant many of these poets are of the fact that this age does not lend itself to small, lambkin words like "glee." The whole world has got an ugly mouthing mood upon it, and the poets must give up skipping like young unicorns, acquire more strength of diction and less of gaiety of meter if they expect to interpret it. Perhaps no other class of prophets are so far behind the spirit of the times. And the explanation is that they lack the power to conceive of or to express the situation. It will require from the poets a new incantation of words such as took place at the beginning of the age of chivalry. Whitman understood this. Unfortunately, he was handicapped by a natural grossness of the mind. He had a maverick genius which bellowed poetry with its head down and its tail flying. This is stimulating, but not exactly the form in which an epic should come upon us.

The unevenness of expression is another sign of the penguin poet. Take, for example, the first stanza of a poem recently submitted by a young person who possessed in some degree the half seer, half song-bird manner of expression which is a part of the poetic faculty. The first lines frame the figure of a maiden like that seen upon old tapestries, perfect in form and grace, the back turned like a slim bow, the face lifted, and the palms of the hands held above her head beseechingly, like the little white wings of her prayer—and she looked for some "subtle word from a star." The author desires to know why all the editors have declined that poem with enigmatical thanks. It is on account of the "subtle" word. Stars have served poets well almost since the first rhymes were sung. They have furnished beams and circles of light. They have "twinkled like a diamond in the sky" and done many other wonderful things, but never, by any inversion of the poetic fancy, have they furnished the "subtle" word, and the term sticks out of these really charming verses like the artificial wing on a lady's bonnet.

But, when all is said, the existence of so many young penguin poets is due to another course besides the intermittent one of June. This is the lack of Faith. All the great poets have had their gods of one sort or another, and in its last analysis poetry is a light that falls from above upon commonplace things, giving to dull facts the meaning of ideality—"The glory and the freshness of a dream." Thru agnosticism or ignorance or indifference the penguin poets have missed this altitude. They do not get light from anywhere. They are down here on the shore with the rest of us. They are poor web-footed souls who have no wings upon which to bear their message.

The Latest Trust

At Marseilles, at the opening of this month, the unfortunates of all sorts formed a syndicate. The blind, lame, deaf, dumb joined hands for their common good. The meeting opened with a brilliant speech by a deaf-mute, who stood upon a bench in order to be seen. A one-armed man offered the customary resolutions; finally a one-legged fellow named Rosin was chosen president. To their great surprise, the delegates appointed to wait on the Prefect of the district were not received. They are now ready to call upon Clemenceau. The Marsilian beggars' trust is highly conservative. So-

cialism and communism are reprobated. They stand for the present order of things and for liberty of conscience, and are ready to take up arms in defense of France. Politics are excluded from their program, but they will endeavor to secure the aid of Parliament to prevent the immigration of foreign beggars. Steps are under way to organize similar clubs or trusts in all the cities of France. Lastly the hope was expressed of an international union of beggars. Last indeed, but not least, perhaps, think what we must suffer when they decide to raise the rate of payments demanded from their patrons.

Scotch Creed Revision

Some years ago the Free Church of Scotland and the United Church, both Presbyterian, settled, for a while, their creed question by adopting a Declaratory Statement which allowed great liberty in the subscription to the Westminster Confession of Faith; and the two churches, now joined in one, possess the same degree of creedal freedom. Just now the Established Church is discussing the same question of subscription, with the assured certainty of an equally liberal result. Indeed, subscription to creeds is coming to be a thing of the past. A volume entitled "Creed Revision in Scotland" has just been published, having eighteen contributors described as leading Scottish ministers. In them there is an astonishing unanimity of opinion on the subject of the Westminster Confession. Dr. Moffatt quotes an influential layman as saying that to him the creed has become "repulsive and hateful," and he describes it as containing "irrelevant and antiquated features." Professor Menzies says that the Confession "is, as the creed of a living church in the present day, impossible." They all condemn it, but they do not agree what to do about it. Some would formulate a new creed of present belief; but how can they agree? Whatever its formulæ it would be regarded by the more advanced as a new yoke of bondage. There are two ways that seem equally possible. One is frankly to have no written creed at all, but to trust to the present guidance of the Holy Spirit in the Church; the other is to hold the Creed as an historical document, but to put it away on a shelf and definitely reduce the terms of subscription.

A Free Church in a Sovereign State

The old watchword of Cavour has just undergone a slight change. Pius X, as is well known, encourages Catholics to take a hand in the elections of Italy. Bergamo was lately the scene of the new clerical propaganda. Their candidate was favored by the Government against the radical. The first election was a draw. The second election—May 26th, a week later—had been preceded by a large program of the clericals, which brought unlooked-for results. This program gave all the credit to the Church for everything in heaven, on earth, under the earth, but it guarded carefully against any reference to Italy united and Italy as a nation. If Italians know one lesson well, it is that they owe their unity and nationality to the capture of Rome and the abolition of the Temporal Power. In a moment the Catholic candidate, Signor Bonomi, saw all his liberal allies abandon him. Four leaders of the Right telegraphed their sympathy to the radical candidate, Signor Rota, who in his turn declared his resolve to follow the lead of the Government. The Prime Minister, Giolitti, publicly repudiated any wish on his part for the election of the Catholic candidate. The Pope's special organ—*La Difesa*, of Venice—much more expressive of his views than *l'Osservatore Romano*, advised that the struggle be given up. At once the Catholic candidate withdrew. The Bergamo electoral issue has distinctly brought to the front the sovereignty of the State, a sovereignty which admits no special privileges for the Church. Hence the expression, "A Free Church in a Sovereign State." This, too, represents the relations of Church and State with us. The State is supreme. The Church of herself can secure legal life only under charter, special or general, from the sovereign State.

The Rev. Patrick Farrell, D.D., rector of the Immaculate Conception Catholic Church of Cleveland, Ohio, writes us:

Your issue of May 16th criticised remarks made by Bishop Horstmann, of Cleveland, at

a meeting of the Builders' Exchange, of this city. I was present at the meeting. The talk of the Bishop was entirely informal, as the session of the association was the regular monthly business session, and no special call had been issued. His theme was the sympathy that should exist between employers and employed. Both sides had a right to organize. Useless, expensive conflict could be averted only by conscientious recognition of rights and duties by both parties. Conscience in the abstract would not avail, but it must be engendered, encouraged and enforced by religion. Military aid would be powerless in an emergency against the passions of an angry mob, and religion's representatives in the past have had more effect in such unhappy contingencies than guns and bayonets. These sentiments were applauded by all who were present, and commented upon favorably by all who knew the circumstances, and the context of the portion of the speech quoted by you. The reporter of a sensational newspaper gave to many, as to you, an unfair impression of Bishop Horstmann's remarks.

Now that President Castro is well again he should be requested to deny the report his friends circulated early in 1905, that he has in his possession documents which affect the honor of a former official of the Department of State, and which are retained by the Venezuelan Government for the purpose of preventing the United States Government from taking any step toward securing justice for American claimants that is not agreeable to President Castro. A frank statement from President Castro that the report is entirely unfounded would increase our prestige thruout South America, and Europe as well, and would diminish the amazement in all diplomatic circles that President Castro has never taken any steps to meet Mr. Hay's demand of two years ago that justice be done to American claimants by the Venezuelan Government without delay.

The leading Anti-Imperialist paper in this country begins an editorial with these words:

"The latest view of the Philippine situation, as set forth by Secretary Taft yesterday at St. Louis, is also the most altruistic. We began by expecting to coin money out of the Philippines, and at the same time make the natives happy."

This statement loudly calls for Presidential characterization. It is not true that "we began by expecting to coin money out of the Philippines." That was not in the thought of any responsible person. We took them simply because we had to, and were then determined to make the best of an unlooked-for burden.

Perhaps one of these days we shall know what the facts are about Mrs. Eddy's sanity and competence to manage her property. The published letter of her son, giving an account of the difficulty he had to see her, and the effort made to recover from him all letters received from her, arouses reasonable suspicion. But the later report from an expert accountant, and another from the treasurer of the savings bank in Concord, assure us that accounts are all right, and that she read aloud, with full comprehension, the document which put lately all her property in the hands of trustees. Possibly the legal proceedings will make all clear.

Now that the Brownsville affair has brought discredit on the negro soldiers, it is pleasant to read in *The Army and Navy Journal* a letter from an officer in the Philippines, giving negro soldiers in the Army the highest praise, and declaring that every officer in the Army who has served with colored troops will agree that "there is no pleasanter service than in the colored regiments." He says they are usually liked in the neighborhood where they are stationed, and mentions that in 1898 the people of Salt Lake City asked that the Twenty-fourth Colored be returned to that post. In no white regiments do so many re-enlist.

The railroads, after all, are not so black as they are painted. Dr. Orlando F. Lewis read a paper this week before the National Conference of Charities and Correction, at Minneapolis, in which he showed that more tramps are killed yearly on American railroads than the combined totals of passengers and trainmen.

They say that Mgr. Montagnini is "amused" at the publication of his correspondence, seized by the French Government. That Cardinal Merry del Val should have trusted such an inept agent gives occasion to the Italian comic papers calling him Cardinal Very del Mal.

Insurance

Insurance Liability for Dynamiting

ACCORDING to a decision just rendered by Judge Hunt, in the Superior Court of California, insurance companies are held liable for damage to a building caused by the dynamiting done in the attempt to check and control the San Francisco conflagration, in spite of the fact that the building in question may not have been damaged by fire. The decision was rendered in the suit for recovery brought by Florin H. Brandenstein against the Royal Exchange and the Hartford Fire Insurance companies. The Brandenstein building was of brick construction and was seriously damaged by dynamiting buildings on the opposite side of the street. In rendering judgment for $2,585, the amount of the damage sustained and the sum sued for, the court said in part as follows:

"In this case it appears that but for such dynamiting the plaintiff's building would have been totally destroyed by fire. If defendant's construction of the terms of the policy of insurance herein is correct, it follows that the owner of the house insured under the terms of a like policy would, in the event of an anticipated or threatened destruction of the insured property by an approaching conflagration, find it to his best interest either to remain supine or else resist to the uttermost any attempted destruction thereof by explosives, or otherwise—even if such a destruction would save a city from flames. In such a case it would be to his best interest to allow his property to be destroyed by fire and thus enable him to recover his insurance. It seems to me that a construction working such results should not be adopted.

"Where such explosives are directly or indirectly the cause of the injury sustained, whether the damage suffered is the result of explosives fired in the plaintiff's building, or is the result of explosives used in a building adjacent, is in my view immaterial. In either event the loss sustained resulted from the peril of fire. The result must be the same, whether dynamite is applied directly to the building insured, and it is thus damaged, or is applied to an adjoining building and thus occasions the injury. The record herein discloses that if the dynamited buildings had not been destroyed the conflagration would not have been checked; the plaintiff's building would have been totally consumed and the defendant company would have been liable for the entire amount of the insurance. From these views it follows that the plaintiff is entitled to judgment as prayed for and it is so ordered."

The Hartford Fire has already announced that it will take an appeal from the decision of Judge Hunt.

What to Do After a Fire

THE Factory Insurance Association of Hartford has recently issued a card notice that contains certain admirable suggestions as to what to do after a fire has been extinguished. Many suggestions have been made in times past as to what precautions should be taken before a fire, but the method of procedure after a fire is on many accounts quite as important. The assured will find a settlement of fire losses far easier if certain things are done than as if they are neglected. The suggestions of the Hartford Association are therefore well worth careful consideration. They are as follows:

Put all fire appliances in commission at once—

a—Fill pails, casks, tanks and reservoirs.

b—Replace all melted sprinklers with new heads.

c—Open all sprinkler valves.

d—Replace hose in hose houses as soon as it has been properly dried.

Take care of damaged property just as if you had no insurance.

a—Remove burnt or suspicious cotton or other stock from factory building where it will not expose your property and provide extra watchmen to care for said stock.

Note.—Many classes of goods, if not properly cared for, are subject to heavy deterioration which prompt handling will prevent.

Prepare an itemized list of all material damaged or destroyed and keep account of labor involved in caring for or watching the property.

Note.—This will facilitate matters in making settlement.

An additional notice to be posted near sprinkler valves, is intended to impress upon the assured and his watchmen the importance of keeping valves open at all times, except when necessary repairs are being made, when a watchman should be at the valve constantly while it is closed.

A life insurance agent should not allow his "prospect" to cherish the idea that a life insurance premium is an expense. The agent should, on the contrary, strive to make him understand that it is more in the nature of a deposit or an investment, the returns upon which in a first-class company are infinitely larger and more certain than are those derivable from even the best savings institutions.

Financial

New England Railways

THE progress of negotiations for what will be practically an absorption of the Boston & Maine Railroad Company by the New York, New Haven & Hartford, has been in some measure concealed by official statements that were misleading, but it is now admitted by President Mellen, in a letter to Governor Guild, that interests identified with his company have acquired a large quantity of Boston & Maine stock; also, that the purchases have been made and are held for his company's account in the hope that an actual consolidation will eventually be permitted. There has been an even exchange of shares, altho the New Haven dividend has been greater by 1 per cent., and it is said that control of about one-half of the Boston & Maine stock has thus been acquired. A sale of the Ontario & Western by the New Haven Company to the New York Central appears to be involved, and it may be that eventually the combination will include the Boston & Albany, of which the Central now holds a lease.

This approaching consolidation, if the Boston & Albany be taken in, will place under the direction of one corporation not only almost the entire steam railway mileage of the six New England States, but also a large part of their trolley mileage, and all of the coastwise steamship traffic not controlled by the Morse syndicate. In a recent increase of the Morse rates some think they see evidence of an agreement with respect to the traffic by water. It does not appear that the absorption of the Boston & Maine is sought in order that land rates may be increased. The two railway systems are not parallel or competing lines. Mr. Mellen predicts that an increase of facilities and a reduction of rates will follow the larger development which he foresees. He also promises that there shall be no stock watering or inflation in connection with the transaction. Governor Guild, remarking that the fulfillment of this promise may be contingent upon the life of one man, or of the present board of directors, urges the Massachusetts Legislature to make clear provision against stock watering and excessive charges, and to make new laws which shall say that any proposed increase of rates or curtailment of facilities may be made only after a public hearing and with the written approval of the State's Railroad Commission.

*

....The world's cotton output in 1906 was 19,942,000 bales, of which this country produced 13,016,000, or a little more than 65 per cent.; British India 3,708,000, and Egypt 1,400,000

....On Canada's 21,353 miles of railway the number of persons killed last year was 361, against 468 in 1905. Of those killed, 16 were passengers and 139 were employees.

....Exports of canned beef in April were only 893,017 pounds, against 4,121,000 in April of last year. For the ten months ending with April they were 13,032,703 pounds, against 56,730,800 in the ten months ending with April, 1906.

....Last year the Pennsylvania road used 5,125,000 ties. This month it is adding 550,000 young trees to the forests from which it expects to obtain a supply in the future. On about 1,000 acres it has recently set out more than 2,000,000 saplings.

....According to the London *Statist*, the world's output of pig iron in the calendar year 1906 was 58,926,603 tons, of which three countries—the United States, Germany and Great Britain—produced 47,934,646 tons, or 81.3 per cent., and the United States alone 25,307,191 tons, or nearly 43 per cent. The output of the United States exceeded by 2,679,736 tons the combined outputs of Germany and Great Britain.

....R. F. Downing & Co., at 58 New street, are forwarders. That is to say, their business is to look after the forwarding of express matter to and from this country. In connection with their business they have just issued a most attractive booklet. The volume is bound in limp leather with blind tooling and illustrates and describes the various departments of the firm's business. The decorations, marginalia, etc., in brown sepia, are lightly and very attractively executed.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Mr. Taft on Wealth and Railroads

Secretary Taft has recently made several public addresses in cities of the upper Mississippi Valley. On the 12th he spoke in Iowa City at the commencement of the Iowa State University. He had been asked by certain newspapers to define his position with respect to questions of the day. As he is a candidate for the Presidency and is said to be regarded by Mr. Roosevelt as an earnest supporter of his policy, much interest was manifested in his remarks about the regulation of railroads and concentrated wealth. He said:

"The irresponsibility of the wielder of millions of capital who has heretofore accomplished his exercise of power in the business communities it is now settled must have an end; and the limitations which shall effectually end it will be dictated by experience and the statesmanlike acumen of the coming generation. Such a change cannot be effected in a short time. Such a change cannot be brought about by mere denunciation and indiscriminate condemnation, whether delivered from a stump or contained in the provision of law. It must and will be fashioned ultimately by the hand of one or many who shall realize the necessity of maintaining the institutions of private property and the freedom of individual initiative on the one hand, and, on the other, of restraining the well-recognized abuses and illegalities of the exercise of the power of concentrated wealth to achieve monopoly by duress. Such regulation is possible, and it only needs experience and earnest effort, honest and courageous and expeditious courts, intelligent and fearless juries to enforce the regulations which shall teach those who would otherwise offend and misuse the power of concentrated wealth that it is not only moral and conducive to their happiness, but also profitable, to observe the regulations that the quickened conscience of the people has insisted upon introducing upon the statute book. The same general observations are applicable to railroads, as they exercise a public function.

"The regulations of their business must be more direct and administrative than that of the combinations of wealth in lines of production to which I have been referring. Not only must they be restricted in the matter of the overissue of stocks and bonds, for the public properly demand this, but the rates they fix must be subject to complete examination and amendment by a tribunal constituted for this purpose, so that the rates shall be fair and reasonable."

It was fair to the railroads, he added, that we should permit them to agree with their competitors on rates, "if such rates are submitted to a proper tribunal representing the public and are found by that tribunal to be fair." It was impossible to prevent the roads from tacitly agreeing between themselves on rates, and without such agreements there would be secret rebates and constant rate-cutting. Therefore Congress should allow rate agreements to be made, with the approval of the Interstate Commerce Commission.

Conviction of Mayor Schmitz

Eugene E. Schmitz, Mayor of San Francisco, was convicted, on the evening of the 13th, of extortion, in that he had shared with Abraham Ruef the money which the owners of the French restaurants were required to pay for a renewal of their liquor licenses. The jury was out an hour and a half. On the first ballot all but one voted for conviction, and the twelfth juror, whose attitude had been due to a misunderstanding about the judge's charge, soon joined his associates. In substance, the evidence was that Schmitz, having directed that licenses be withheld from the restaurants, went over to the other side of the question after Ruef had exacted

from the restaurant keepers a "counsel fee" of $5,000 per annum, paid in advance, and after he (the Mayor) had received half of the money. On the witness stand, Schmitz denied that he had received the money from Ruef. Whereupon Ruef (who recently pleaded guilty to a similar charge) testified that he had paid to Schmitz $2,500, as his share of the first year's fee, and had later given him $1,500 more, as his share of a second instalment from the five restaurants. Judge Dunne charged the jury that Schmitz should be acquitted if it had been shown that he received the money without knowing that it had been paid to Ruef under a threat of unfavorable action. This is the first conviction resulting from the recent exposure of municipal corruption in San Francisco. The extreme penalty is imprisonment for five years. There are scores of additional indictments against both Schmitz and Ruef, in cases of greater importance. Bail for the Mayor was refused, and he was placed in jail. Under a law, the enactment of which was cunningly procured by Ruef for the protection of certain election officers, Schmitz cannot be ousted from his office until his conviction has been confirmed by the higher courts, to which he will appeal. But while in prison he cannot perform the duties of his office, and the Supervisors will appoint one of their number to be Acting Mayor. They will probably appoint James H. Gallagher, who held the office while Schmitz was in Washington, conferring with the President about the Japanese school children. Nearly all of the Supervisors, by their confessions, are guilty of receiving bribes. Their official action will be governed by the advice of Prosecutor Heney. Gallagher received the largest sum in bribes, being the agent of Ruef and the bribe-givers for the distribution of the money among his associates in the board. Some predict that one of the Supervisors will resign; that the vacancy will be filled by the appointment of a prominent and trustworthy citizen named by Mr. Heney and the reformers associated with him; that this man will be made Acting Mayor, and that the board will elect him Mayor after the final decision on Schmitz's appeal. The citizen commonly mentioned for the place is James D. Phelan, who contributes to this issue of THE INDEPENDENT an article on "The Regeneration of San Francisco." Mr. Phelan has been Mayor of the city for three terms, by election, and in that office he made a very creditable record.

Anthracite Coal Trust Sued

The long-expected suit of the Government against those railways and subsidiary mining companies which form what is commonly called the Anthracite Coal Trust, was begun by the filing of a petition in the Circuit Court at Philadelphia, on the 12th. A statement published by the Department of Justice shows that the defendants are the Reading Company (a holding corporation), the Philadelphia & Reading Railroad Company, the Lehigh Valley Railroad Company, the Delaware, Lackawanna & Western Railroad Company, the Central Railroad Company of New Jersey, the Erie Railroad Company, and the New York, Susquehanna & Western Railroad Company, these being all the roads that tap the anthracite districts, except the Pennsylvania, the New York, Ontario & Western, and the Delaware & Hudson, the last of which does not extend to tidewater. The subsidiary mining corporations of the railway companies are included. As yet, it is stated, no evidence of sufficient probative force to connect the three roads excepted above with the unlawful combination has been found. If it should be obtained in the course of the trial they also will be made defendants. The proceedings, says the Department of Justice, are "aimed at the anthracite coal monopoly." It is said in the petition that the defendants control all the means of transportation (except the lines of the three companies not sued, which reach only a small number of collieries) between the mines and tidewater; that they carry 78 per cent. of the anthracite tonnage; that they control 90 per cent. of the deposits and produce 75 per cent. of the supply. Independent operators produce 20 per cent., which would be sold in competition with the defendants' output but for the restraints which the defendants impose. It is charged that the defendants have conspired to silence competition among

themselves and to suppress the competition of independent operators, thereby establishing a monopoly. They have done this, it is asserted, by forcing certain contracts upon the independent operators; by an exchange of shares, which has combined the Erie with the competing Susquehanna & Western; by a similar combination, thru the agency of a holding company, of the Reading and the Jersey Central (which carry 33 per cent. of the tonnage and control 60 per cent. of the deposits), and by defeating twice in recent years the construction of projected railroads which would have introduced competition in transportation and would also have permitted competitive sales of the independent operators' output. The petition prays that the defendants be enjoined from further carrying out their combination; that the contracts mentioned be canceled, and that the mergers between the companies be dissolved. The defendants must answer on or before the first Monday in September. These proceedings are due mainly to the action of William R. Hearst, who filed with the Commission, in 1902, a complaint. In the hearings which followed, officers of the roads refused to produce certain contracts and papers. Litigation on this point ensued, and a final decision in support of Mr. Hearst's contention and against these officers (of whom President George F. Baer was the most prominent) was obtained in 1904. The case was reopened by the Commission, and a report to the Attorney-General was made. An examination was conducted by Charles E. Hughes and Alexander Simpson, Jr., J. Carroll Todd succeeding Mr. Hughes when the latter was elected Governor of New York. Upon the recommendation of these attorneys, the petition has been filed. Mr. Baer is president of six of the defendant corporations, one of which is the Temple Iron Company, alleged to be a kind of central agency by means of which the alleged combination has been maintained. ——Under instructions from Washington, the District Attorney at Philadelphia laid before a grand jury, last week, evidence relating to what is alleged to be an unlawful combination of the manufacturers of umbrella frames and umbrellas.

Railway Topics

In 1904, the Union Pacific and the Rock Island railroad companies entered into an agreement, to continue for ten years, providing for joint control of the Chicago & Alton. Control was to be exercised by each company in alternate years. On the 14th the Rock Island company gave notice to the Union Pacific that this agreement, in the opinion of its counsel, was illegal, and therefore would be regarded by the Rock Island as null and void. The Union Pacific consented to the abrogation of it, altho that company's counsel said it was not illegal. A majority of the Chicago & Alton stock is said to be owned by the Rock Island, whose action is reported to have been suggested by the Interstate Commerce Commission, in whose opinion the agreement had been made in violation of law. Recent reports have said that the Union Pacific would probably be prosecuted on account of this agreement and another one, under which rates on the San Pedro road were controlled. The San Pedro agreement was cancelled a few weeks ago.——Western railway companies have decided to withdraw all special rates heretofore offered to clergymen, Sunday school excursions and agents of charitable societies, pending a final decision as to the validity of the two-cent laws. In Missouri, eighteen railway companies have asked the Federal court for an injunction to prevent the enforcement of the State's new two-cent law, which went into effect on the 14th. At the same time the State authorities have procured from a State court an order directing the companies to obey the law. Governor Hughes has vetoed a two-cent law in New York, and a bill for a similar law has been rejected in the Wisconsin Senate by a vote of 41 to 6.——James J. Hill, chairman of the Great Northern board, says in a published interview that it is still very difficult for the railway companies to borrow money:

"A probable solution of the problem is this: The Government may ultimately be forced to lend its credit to finance the needs of the railroads. In its exasperation the public may demand that the railroads lay more rails and add more cars. The railroads will reply that they cannot, that their credit has been seriously impaired. In this event the Government will be obliged to step in and lend its credit to sup-

ply the deficiency. The situation might lead to government ownership of railroads and that would be the end of republican government. This is no mere theory, but a condition. The country is large and still growing. The railroads are away behind. They cannot finance a recovery. What will be the result?"

Some other railroad men express their disagreement with him, one or two remarking that the decline of Great Northern from 348 to 125, and of Northern Pacific from 230 to 123, has made him pessimistic.——W. H. Bennett, of Toledo, formerly freight agent of the Ann Arbor Railroad, has been indicted for granting rebates on shipments of ice. The railroad company recently pleaded guilty to a similar indictment and was fined $15,000.——Notice has been given to all railway companies doing an interstate business that on and after July 1st they will be required to adopt a uniform system of accounting prepared by the Commission.

Zelaya's Aims in Central America

President Zelaya, of Nicaragua, appears to have thrown off all disguises as to his purpose concerning a consolidation of the Central American republics. On the 11th the port of Acajutla, Salvador, was attacked by the Nicaraguan gunboat "Momotumbo," from which 800 revolutionists, under the command of General Rivas, a Nicaraguan, were landed. They proceeded to Sonsonate, forty miles away, where they were driven back by Salvador's troops, but not until they had robbed the custom house and a bank. On the 12th they re-embarked, leaving behind a few prisoners, one of these being Juan Moissant, formerly of San Francisco, who, with his brothers, owns a large plantation near Sonsonate and has been conspiring against President Figueroa. The open avowal of Zelaya's purpose is seen in the following cable message received by our State Department on the 14th from Consul-General Olivares, at Managua, in response to an inquiry from our Government as to Zelaya's connection with the raid at Acajutla:

"I am officially informed that in accordance with the Central American union plan, President Zelaya has despatched munitions of war and troops in aid of General Alfaro, who is the popular unionist candidate for the Presidency of Salvador. President Figueroa opposes the union plan."

The ink on the peace treaty signed at Amapala by Nicaragua, Salvador and Honduras is scarcely dry. This treaty provides that all differences shall be adjusted by the arbitration of Presidents Roosevelt and Diaz, and also that a peace congress of the five republics shall be held in Nicaragua. It is expected that Figueroa and his Government will be attacked from Honduras (now controlled by Nicaragua) by troops under General Toledo and General Alfaro, and on the Pacific Coast by an expedition from Nicaragua. Mexico is still moving troops to positions near the boundary of Guatemala.

Subjection of the Pulajanes

The fanatical outlaws in Leyte, who are called Pulajanes, have been subdued. On the 6th inst., their leader, Faustino Ablen, was captured, together with several of his lieutenants, and on the 15th he issued a manifesto, directing his followers to surrender. During the last five months these outlaws have been pursued in the mountains by 500 soldiers and an equal number of the constabulary. Valuable assistance has been given by native volunteers, and a priest at Ormak induced 120 of the fanatics to lay down their arms. It is reported that Otoy, the leader of the Pulajanes in Samar, was killed in a skirmish with the constabulary some weeks ago. It is expected that the troops will now be withdrawn from both of these islands.——F. B. Thornton, chief clerk of Captain Frederick W. Cole, who was tried for complicity in frauds alleged to have been committed in the quartermaster's department at Manila, has been acquitted, and it is said that the similar charges against Captain Cole will not be taken into court.

Cuba

Under the final decision of the board of arbitration at Santiago, the men recently on strike are to have a nine-hour day thruout the coming year, with the wages heretofore paid. This arbitration tribunal, over which an American army officer presided, is said to have been the first in the history of

Cuba.——The editor of the Havana *Post* has been indicted for criminal libel because he accused Count William Redding and Mr. Steinhart, the American Consul-General, of conspiring to rob the Government in connection with the recent sale of Catholic Church property. It is said that Mr. Steinhart will also sue him for criminal libel.——Committees of Conservatives have made complaint to Governor Magoon about a great increase in the prices of food and the cost of living. This increase, it is asserted, is the cause of much suffering.——Owing to the strike of the cigarmakers, the number of cigars exported has fallen from 16,330,000 in February to 4,521,000 in May.——The quarrels between the two factions of the Liberal party have caused General Pino Guerra and a considerable number of Liberals to suggest that both of the rival candidates for the Presidency, General José Miguel Gomez and Senator Zayas, should withdraw from the field.

The End of the Duma

The Russian Duma has been dissolved by decree last Sunday. It has been a great surprise to the world that the Duma has survived so long; but the Czar did not dare to dissolve it, because that would prevent the borrowing of money abroad. The French and other bankers have demanded the assent of the Duma to any loans that might be made. But the extreme ducal *entourage* of the Czar has been very strenuous to dissolve the Duma, and it seems now to have compelled Premier Stolypin to accept their program. He appeared before the Duma and demanded that permission be given to arrest and try fifty-five members who are charged with treason in trying to overthrow the empire and create a republic. He presented a mass of evidence, which he laid before the Duma. Meanwhile a heavy body of Cossacks was brought to surround the place of meeting, in anticipation of any resistance. The Constitutional Democrats have taken great care to give the Czar no occasion to dissolve the Duma, and it was believed that Stolypin was anxious to keep it alive, while the extremists in the Duma itself were ready to create such a condition that dissolution would follow, with the consequent disorder and rebellion; and the extreme reactionaries in the Duma took the same position. It is very likely that some of these fifty-five accused members have been guilty of the charge, and certain evidence against them was lately secured by an arrest and search; but it is equally likely that against others the total evidence rests in the fact that they are Socialists, and all Socialists believe in a republic. Stolypin desired speedy action, and a committee was appointed to consider the evidence and report. The committee could not report on Saturday and was continued till Monday. M. Stolypin was very anxious not to seem to act arbitrarily, but desired to have it appear that the Duma was dissolved by its own fault in rejecting the demand of the Government. It is reported that the committee was ready to report a compromise allowing the arrest of certain members, against whom the evidence is strong, but refusing to allow the arrest of the others. Meanwhile the Duma, altho under great strain, has continued its sessions in an orderly way, carrying on the ordinary business and awaiting events. Several of the implicated members have fled, and one of them was arrested on the Finnish frontier, altho legally there was no authority to arrest him while the Duma was in session. The extreme advanced groups—the Social Revolutionaries and the Social Democrats—threaten to continue in session uninterruptedly, defying dissolution, and take the consequences. Meanwhile dissolution is likely to start violent revolutionary attempts, altho no one knows what action was taken in such a case by the revolutionary congress which lately met in London, the members of which have agreed to return to Russia, probably to stir up revolt. There is reported an attempt on the part of the crew of the Russian war vesels in the waters about Odessa to create a mutiny and seize the vessels, but it was discovered and several hundred were arrested. The final dissolution of the Duma was by a special order of the Czar, who yielded to the advice of the ducal party, against the advice of Stolypin, for he wished to delay the dissolution until after it had taken action on the demand for arrests. The document is a long one,

and had been prepared some weeks before, and makes provision as to the election of a succeeding Duma, by limiting the number of voters, according to their wealth, and reducing the number to be chosen from disaffected districts. Thus the Caucasus will have but 10 instead of 25 members, and Poland 12 instead of 37. Populations are divided according to nationality or property in the most arbitrary way. The number of cities having separate representation is reduced from 24 to 6, and the peasants lose their separate representation in each of the provinces.

The Hague Conference

The second meeting of the International Conference of The Hague was convened on Saturday of last week. The members are more in number than at the first meeting, as the Central and South American republics have now been admitted on giving in their adhesion. These nations, with Cuba, are thus added to the twenty-six nations which at the preceding meeting were represented by nearly a hundred delegates. The American representatives are Joseph H. Choate, Gen. Horace Porter, David J. Hill, United States Minister to The Hague; Gen. George B. Davy, Rear Admiral Charles S. Sperry, William I. Buchanan, and U. M. Rose, of Arkansas. With them are Chandler Hale, as secretary, and Prof. James B. Scott and Charles H. Butler as experts. It was in 1904 that the present Conference was decided upon, but it had to be deferred until the conclusion of the Japanese war. It was proposed that President Roosevelt should issue the call to this Conference, but he courteously yielded to the Emperor of Russia, who had called the first Conference of 1899. In our issue of April 11th we gave the program offered to the Conference, besides which may be brought up the proposals from the United States and Great Britain for the limitation of armaments, which other Powers decline to accept, and also the Drago doctrine urged by some South American republics. At the opening session, Saturday afternoon, June 15th, the delegates and their attachés occupied nearly all the 239 seats assigned. The meeting was in the Knights' Hall of the Bittenhof Palace. They sat at tables and were arranged alphabetically, according to their countries, in French, on each side of the president. Thus Allemagne (Germany) and Amerique (America, United States of) were first. Dr. von Goudriaan welcomed the delegates in behalf of the Queen of the Netherlands, and expressed the gratitude of the Conference to "the eminent statesman who presides over the destinies of the United States, and who powerfully contributed to the growth of the seed sown by the august initiator of the solemn international assemblies to discuss and define international law." He then introduced M. Nelidoff, who made an opening address in behalf of the Czar, in which he avoided debated subjects, and commended to the delegates "the impossible, but ever to be desired, ideal of the peace of the world." The plenary meetings are to be open to the public, and full reports will be published of the sessions of the committees. This is to avoid misunderstanding, particularly so that it may not be insinuated that Germany, or some other Power, is blocking agreement on practical results. There will be probably five committees appointed at first, of which the most important will be that on preparing a model arbitration treaty and "otherwise facilitating arbitration." Another will be that on the immunity of private property at sea, and on both of these Great Britain and the United States will desire to be strongly represented. A committee on the limitation of armaments will not be appointed until the subject is in some way presented, as it is not on the official program. The Drago doctrine, which would forbid coercion for the payment of debts by the seizure of ports, is of great interest to Argentina, Venezuela and some other South American nations, and they would yield all else to secure this, but two of the chief South American nations, Chile and Brazil, object and feel that it is derogatory to their dignity to ask such protection. It is somewhat feared that the large number of small Powers, not particularly interested in the chief subjects, may make difficulty when it comes to a vote. It is not fair that Germany or France should count for no

more in reaching a decision than one of the small Central American republics; but it is impossible to have the voting rank depend on population, or China would have ten times as many votes as Germany. This matter will have in some way to be settled before it comes to appointing the committees, for it would be ridiculous to have all the nations equally represented on the committees. A difference in the composition of the Conference from that of the Conference of 1899 is noted, in that this Conference is largely composed of international lawyers, while that was composed of diplomatists. It indicates that the Conference is already recognized as a legislative body, devoted to the development of international law. It is announced from Washington that our Government will not introduce the subject of the limitation of armaments, as it is a matter that does not concern us, with our very small army, but concerns the European nations. Professor Maartens some time ago made the round of the European capitals, and he learned that the Governments of Russia, Germany, Austria-Hungary and Italy are opposed to introducing the subject, while France, Great Britain and the United States would be pleased to have it introduced; but with so much opposition it may not be even proposed. In this connection it may be mentioned that two important treaties are announced, one between England and Spain, and another between France and Spain, settling the respective rights of each power in the Mediterranean and on the Atlantic. There is here no tripartite treaty, but it amounts to that, and settles all difficulties as to Morocco.

The Japanese Flurry

The week has been one of rumors about the feeling in Japan over the treatment of Japanese subjects in San Francisco. The essence of them is that certain Japanese papers of the more sensational sort have been very angry, and one or two leading men have said bitter things, but the attitude of the Government has been quite correct. It has advised the press to abstain from publishing any inflammatory or agitating matter, having called the editors to the Home Department for the purpose. It is explained that the recent assaults on Japanese in San Francisco were merely incidents growing out of the industrial troubles in that city and constitute no cause for diplomatic action. Baron Komura, the Japanese Ambassador at London, has issued a statement to the press reciting the facts in respect to the attack on the Japanese restaurant in San Francisco on May 20, and the negotiations which followed between Washington and Tokio, concluding as follows:

> "As you will observe from the above statement, the whole matter is pursuing its normal course and there is absolutely nothing which would in the least justify the alarmist rumors emanating from irresponsible sources."

This is in line with the denial of an alleged interview by Viscount Aoki, Japanese Ambassador at Washington.

The Condition in the Midi

We have mentioned the outbreak among the vine-growers in the Midi, or south of France, but the condition has grown more critical of late. They are a people who give all their labor to the production of wine, and have done so for many generations, and know no other business. They are unprogressive and excitable. The price of wine has so fallen that they are in a condition approaching starvation, and they call on the Government to remedy their distresses, which they are convinced are due to the abundance of adulterated wines. They do not consider that other causes are the reduced demand for wine caused by the increased use of malt liquors, the temperance agitation and the more productive American vines. There are several hundred thousand of these people, and they are now in a state of substantial revolution against the Government, while loudly proclaiming their devotion to the Republic. Scores of mayors have resigned, with the officials under them, as a protest against the neglect of the Government to mend matters. It will be remembered that France is a centralized republic, and the mayors are responsible to the Government at Paris and not to the electors. Accordingly M. Clemenceau, the Premier, has stoutly forbidden these resignations to be held valid until accepted at Paris. There has been trou-

ble because couples wishing to be married could find no official to perform the ceremony. The Government has done the best it could. A law has been past forbidding adulteration, and experts have been directed to make a careful investigation of adulterations with a view to suppressing the evil. Indeed Dr. H. W. Wiley, Chief of the Division of Chemistry in our Department of Agriculture, a recognized expert, has been called to Paris to take part in this scientific inquiry. In this country the agriculturists, when they find one source of income to fail, will turn to another, but this is not the way in the Midi. There the land is given to vineyards, which have been in constant culture for centuries, and the removal of the old stocks would seem to the people to destroy their only known source of income. At present the people are running their own affairs in their own way, and M. Clemenceau is waiting for their passion to subside.

Church Affairs in France

During the Concordat no meeting of churchmen was permitted without the consent of the State. Liberty of assembly was one of the first effects resulting from disestablishment. Freely and often have the clergy enjoyed the freshly found freedom. The latest was during the last week of May, when a diocesan congress was held in Paris. During the sessions explanations were given how to organize cultual associations which would not incur the censure of Pius X's encyclical. These are called parochial associations, confessional and non-cultual. Upon this subject, Mgr. Amette, the auxiliary bishop of Paris, stated that Pius X, far from disapproving the associations not legally declared, which existed before the law of 1905, encouraged them. In conclusion, resolutions were passed providing for the organization of parochial committees, in union with the Episcopal diocesan bureau. The diocese of Paris is thus taking every advantage of the present legal status. Meanwhile the Catholic world is busy. A pamphlet "To Pius X" has just appeared in Rome, which is a direct appeal to the Pope. It reproaches him with his stand against modern ideas; it develops the program of the advanced clergy, who demand the evolution, both political and intellectual, which is needed to bring the Church into harmony with democracy and science. The pamphlet demands liberty of conscience for priests, praises the now-suspended Murri, and protests against his treatment. Amid all this comes the news from Milan that Pius X will send Cardinal Vincent Vanutelli as legate to preside over the German Catholic Congress which will soon meet at Metz. All other powers, even non-Catholic, have abstained from appointing delegates for this congress because of French susceptibilities; for Metz, up to 1870, had been French territory for over fifteen centuries.

The House of Lords

Once more Prime Minister Campbell-Bannerman has uttered a threat against the House of Lords. Since the Education bill was contemptuously rejected by the Upper House, and since the House of Commons, with its enormous majority, has failed to carry any important legislation which had been proposed by the Government, there has been a repeated and insistent demand that the House of Lords be reformed, or its authority so controlled, that legislation demanded by the people can be carried thru. The Lords have themselves appointed a large and strong committee to propose a reform, perhaps somewhat in the line of that which already exists as to the Scotch aristocracy, who elect a small number from themselves who shall have the right to sit in the House of Lords and represent them. Last December Sir Henry Campbell-Bannerman declared that "a way will be found by which the will of the people, expressed thru elected representatives, will be made to prevail." Now he produces in Parliament a resolution to the effect that a reform must be secured. It is not clear that he now proposes to present any definite legislation, and it may be that this is little more than an announcement that when an appeal is made again to the country the reform of the House of Lords will be a principal demand on which the will of the people is sought.

The Tragedy of Tolstoy

BY SOPHIE WITTE

[The following article about the world's greatest living literary genius is by the gifted sister of Count Witte, whose articles in THE INDEPENDENT our readers will remember. It has been translated by Herman Bernstein.—EDITOR.]

THE name of this remarkable man and great writer is known to the whole civilized world, to all mankind that reads books. His works have been translated into forty-five languages and dialects, and millions of copies of his books are being purchased every year all over the world.

During the fifty years of Count Tolstoy's literary activity a special literature has grown up around the man and his works. Hundreds of biographical studies have been written about him by his friends and by his enemies, by prejudiced admirers as well as by merciless critics. But the most interesting of all these biographies was written by Count Tolstoy himself. Unfortunately, he has described only the early part of his life.

MISS SOPHIE WITTE.

Lyov Nikolayevich Tolstoy is a direct descendant of the first Count Tolstoy, Peter Andreyevich, the notorious statesman who lived during the reign of Peter the Great. Count Peter Andreyevich Tolstoy was a man with a great mind, but a base soul. While holding the position of a *Kammerherr* at Court, he betrayed Peter the Great, organizing a mutiny among the Russian troops for the purpose of seating Peter's sister, Princess Sophie, on the throne. When Peter succeeded in dethroning his sister and seizing the throne unto himself, Tolstoy betrayed the Queen and went over on the side of the Czar. Peter the Great disliked Tolstoy and distrusted him, but he valued him for his abilities and his wisdom. Very often, during the feasts in the palace, Peter would tear off Tolstoy's long wig, and clapping him on the back of his head, would say jestingly: "Oh head, oh head, if you were not so wise, you would long have been severed from the body"

Peter Tolstoy got his title of Count as a reward for his active participation in condemning to death the heir to the throne, Prince Alexis, Peter the Great's only son.

There is a popular superstition that the grave sin of the first Count Tolstoy is still hanging over his descendants. It is true that the number of tragic, unnatural deaths and suicides, and especially the number of people who have become insane in this aristocratic family, has been astonishingly great. But, on the other hand, it must be said in justice that if no other aristocratic family in Russia had so many insane members, there is surely not another aristocratic family that has given to Russia so many gifted people as the Tolstoys.

Several Tolstoys have graced the history of Russian literature; of these Count Alexis Tolstoy, the poet and dramatist, and his cousin, Lyov Tolstoy, this giant in mind and genius, achieved the greatest fame.

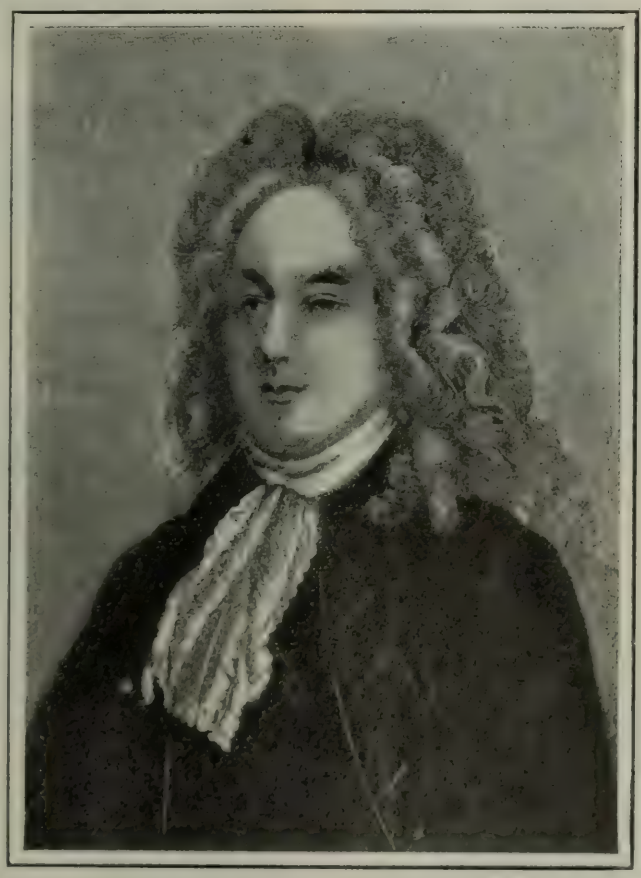
Count Lyov Nikolayevich Tolstoy was born in 1828 in the village of Yasnaya Polyana, the same village in which he now lives. He lost his father while he was yet very young, and tho he does not remember his mother at all, he has

COUNT TOLSTOY'S FATHER, COUNT NIKOLAY ILITCH TOLSTOY.

formed a conception of her in his mind as of a remarkable, sublime, chaste being. According to his own confession, Tolstoy, tho already a man who was thoroly conscious of the life about him, in moments of painful struggle against temptations, had frequently turned mentally to the pure soul of his mother for aid, and always found consolation and relief in those pure prayers.

Tolstoy was brought up by a distant relative of his father's, an old maid who was known in the house as "Aunt Tatyana." She was a remarkable person, and her influence upon her charge was tremendous. She has long departed this world, but Tolstoy has to this day retained a feeling of tender love and profound gratitude to her for having taught him how *to love*—the loftiest pleasure in life. Tolstoy devotes to her some of the most beautiful pages in his "Reminiscences." He recalls with reverence and intense emotion the last wish of Aunt Tatyana, who, on feeling that her end was nearing, asked to be taken out of her room in order not to spoil the room by the painful impression that her death might make on those who were to stay there after her. Affected by her self-denial, Tolstoy recalls at the same time the fact that on a certain occasion he had refused her an insignificant sum which she wanted for sweetmeats, and he reproaches himself, regarding that refusal as the most despicable act of his life, and to this very day he cannot think of the incident without a sense of horror and aversion for himself.

Lyov Nikolayevich Tolstoy grew up and was educated together with his three



SILHOUET OF TOLSTOY'S MOTHER AND HER SISTER. ONLY EXISTING PORTRAITS.

brothers and his sister. All his brothers died as young men and his sister, tho still alive, has long retired from the world, having entered a convent. In his childhood Tolstoy was most incapable and lazy. The German tutor in the Tolstoy family characterized his pupils in the following manner: "One of them is both willing and able; the second is willing but not able; the third is able but not willing; while the fourth is neither willing nor able." This fourth was Lyov Nikolayevich Tolstoy. From his very

early childhood Tolstoy felt that his soul was seized with two distinct, powerful feelings, with which he struggled fiercely almost all his life, and which he defeated at last only in his declining days. The first of these two strong feelings was self-love, and the second, fear of death.

The feeling of self-love sprang up within him with the first consciousness of life. He began to love himself while he was seated in the tub which was filled with warm water, he then began to love his small, bare body, with the protruding ribs on his chest. The seed of this self-love kept developing and growing stronger as he grew older, and at times this self-love was transformed into a feeling of self-hatred

"I always knew," he says, "that the *real* happiness of man consists of loving one's neighbor, of loving others, of loving all mankind, and yet I loved only myself with a *real* love. I loved myself and hated myself. I hated myself profoundly because I loved myself so passionately!"

FIRST COUNT TOLSTOY.

The feeling of fear of death took hold of Count Tolstoy during his early childhood, when he saw for the first time a dead man placed in a coffin. This fear expressed itself in the child in a terrible outcry which frightened him even as death itself had frightened him.

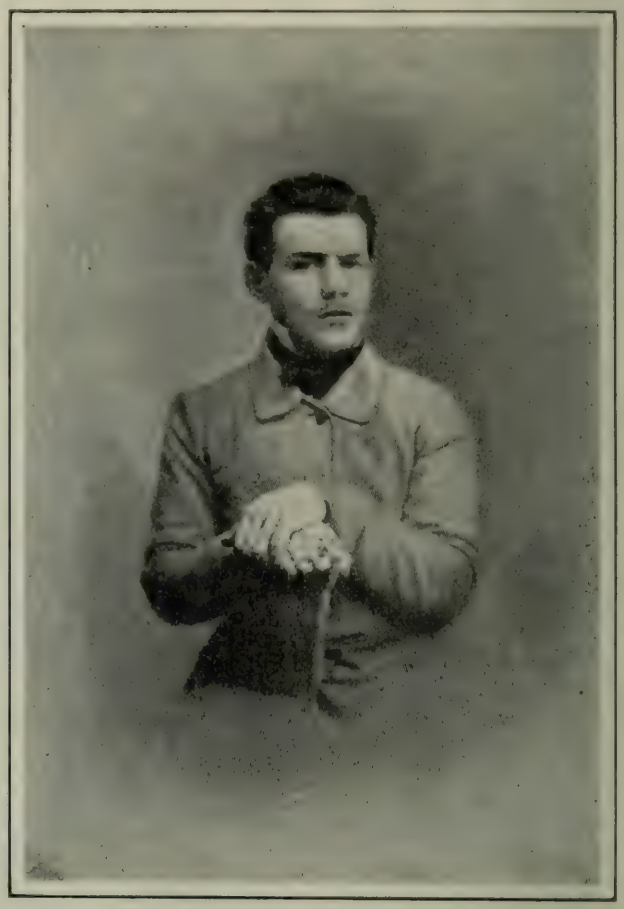
From his childhood Lvov Nikolayevich Tolstoy did not carry away any characteristic or in any way remarkable impressions which could have exerted a strong influence upon his childish mind. The life of the family in which he grew up was the ordinary gray life of rather poor and simple gentle-folk estate-owners of that time. Notwithstanding the still existing serfdom at that time, the relation of the masters toward the serfs in that family was humane. Lyov Tolstoy did not see any harsh treatment of the servants by his father. He recalls with pleasure how his father, who noticed one day in the mirror that his lackey was stealing his tobacco, instead of accusing the servant of stealing, turned the whole matter into a joke. And yet, at the same time he recalls how his kind father seemed indifferent when he was told by one of his neighbors and friends that he sent his cook to the army for twenty-five years merely because he ate meat during Lent.

Tolstoy's father was undoubtedly a kind man, but he lived during a period of cruelty.

Tolstoy received his preliminary education at home, in the village; then he was sent to school in Moscow. Here he began to show close application in his studies and rather unusual abilities. The instructor of French, on reading his composition, exclaimed: "What a mind! This is a small Moliere!" In Moscow the boy developed rapidly. He soon began to think seriously, anxious to solve the question: "What is Truth?" He was already musing about life, about death, about religion, about happiness.

He believed in God because he believed in the faith of others—of people who were older than himself—but his faith was so unstable that when a friend of his announced to him one day that there was no God, Tolstoy accepted this as a very interesting and quite plausible fact.

Musing on what constitutes happiness, Tolstoy arrived at the conclusion that



SOPHIE ANDREYEVNA BERG, 1860.
Future Countess Tolstoy.

happiness does not depend upon external causes, but upon our relation to it; that a man who is accustomed to enduring sufferings cannot be unhappy. Having come to this conclusion, he commenced to subject himself to various tortures. For instance, he would take a heavy book and hold it for a quarter of hour without moving his outstretched hand, or he would lock himself in a dark storeroom and lash himself with a strap on his bare spine until tears would trickle down from his eyes for pain.

Then it suddenly occurred to him that death was near him, that it stood ready to claim him at any moment, and under the influence of this thought he decided that man can be happy only in the present, forgetting the future; he would therefore leave off studying, would lie in bed all day long, reading novels and eating sweet cakes, on which he spent his last pennies.

Upon graduating from the school in Moscow, Tolstoy went to Kazan, where he entered the university. During the two years that he stayed in Kazan he led a worldly mode of life. He was mingling in the highest society of Kazan, where he was in great demand, for he was regarded as a well-educated young man, a fair musician and a clever dancer.

Suddenly, without any apparent cause, a great change came over Tolstoy's soul. All that he had done until then suddenly

TOLSTOY AS A STUDENT IN 1851.

appeared to him empty, vain, superfluous; the society people about him seemed to him repulsive for their hypocrisy. He now felt convinced that there was no truth in their life, in their feelings or in their faith—that truth for which he was consciously beginning to yearn. Tolstoy immediately left the university and went back to the village in quest of *happiness*. It seemed to him that he found it within himself, in constant efforts to perfect himself and in striving toward the highest ideal: perfect purity and chastity of body and soul.

For a whole year Tolstoy lived in the country all alone, devoting all his time to self-perfection and self-education. He read a great deal, studied philosophy, medicine, political economy and various languages.

But soon a new change came over him

again. Disenchanted and disappointed in himself, in his spiritual powers, he left the village and went to the Caucasus, to the regiment of which his older brother was an officer, and there entered the service of the army as a non-commissioned officer. He passed his time in hunting, drinking, playing cards, contracting debts and making love to the Cossack girls. But he soon grew tired of this mode of life as well. He took a leave of absence and started for Tiflis, the capital of the Caucasus. Having contracted numerous debts, he was compelled to live economically; so he hired a little room in the outskirts of the city, in the German colony, for five rubles a month. There he lived the life of a recluse.

TOLSTOY, 1856.

And amid the simple surroundings of the plain colonists, under the clear autumn sky of the south, when the fruits in the gardens and the vineyards were already ripe, the first spark of talent flashed up within the world's greatest novelist, awakening in him an intense eagerness to do creative work. He took up his pen bashfully and timidly, without suspecting in the least that his pen contained his future fame and the pride of Russia. Writing for himself, merely to while his time away, Tolstoy produced his artistic story, "Childhood." When he had finished this masterpiece, Tolstoy, after considerable hesitation, decided to send it anonymously to the well-known poet, Nekrasov, who was editing a magazine at that time. The story soon appeared in the magazine and proved a great success. The famous writer Dostoyevsky, who was then in exile, wrote to Nekrasov from Siberia, inquiring who the mysterious author of "Childhood" was. And the mysterious author concealed from everybody, even from his own brother, with whom he lived, that the splendid story was his.

While reading aloud to his brother an article in which his story was praised, he was scarcely able to restrain his tears of emotion, and his consciousness that no one knew that it was he who was praised so highly, filled him with keen satisfaction.

The year of the Crimean campaign arrived. Tolstoy was promoted to the rank of artillery officer and was sent to Sevastopol. There he wrote several stories

TOLSTOY, 1862.

of the war. When Emperor Alexander II read these stories which were signed with the full name of the author, he issued an order to the general of the regiment to take care of officer Tolstoy and not to expose his life to any danger.

At the end of the war Tolstoy retired from the army, settling down in St. Petersburg and devoting himself exclusively to literary work. Thus he worked for several years. During that period of his life he went abroad twice. The first trip was taken for his personal pleasure. In Paris Tolstoy witnessed the execution of a man and that scene impressed itself upon him painfully for all his life. He recalls that act with great aversion and finds that there is nothing that could justify it.

"If all the people in the whole world," he said, "ever since the creation of the universe, found that according to some theory such a thing was necessary, I feel with all my being that it is not necessary, that it is repulsive."

The second time Tolstoy went abroad with his sick brother, who died there of consumption. His brother's death filled him with horror. He was seized with a painful sense of fear of death, which turned at the same time also into a fear of life. "I saw my brother's death," he wrote to "Aunt Tatyana." "Nothing can be worse than death, and if we consider that death is the inevitable end of every living being, we must admit that there is nothing worse than life."

But little by little this impression was effaced, and a long period of perfect bliss set in for Tolstoy. His literary success grew with each new production. His novel, "War and Peace," brought him both fame and wealth. He married the girl he loved, who became a model wife, a friend and a comrade to him, and who bore him good, healthy children. Fate fondled him tenderly, bestowing upon him all kinds of earthly gifts. "Fate has given me all that can be imagined," he said to one of his friends at that time, "a fine family, a loving wife, universal fame, wealth, health, everything! If a fairy came and offered to fulfil any of my desires, I would not know what to ask for."

But when he reached the highest point of happiness that man can attain, he began to look ahead, into the future, beyond the boundaries of the present; he began to consider that which will be or which may be, as tho the gods, at last, envying the too happy mortal, reminded him not with a loud threatening voice, but in a short whisper, that there was an end to everything and that he was only a mortal. All was well with him, there was no misery in his household, no losses, no sickness; his wealth was increasing, his fame was attaining unparalleled dimensions; his lucky star was shining like a bright sun over his life, but the fear of death had craftily stolen into his life like a thief in the night. Acute anguish built a nest for itself in the heart of this happy man.

Referring to this period Tolstoy writes in his confession:

"Something very strange was taking place within me, moments of perplexity came over me, I felt as tho I did not know what mode of life to lead; I did not know what to do. These halts in my life always expressed themselves in the same questions: 'What for? What will be later?' It seemed to me as tho I lived and lived, as tho I walked and walked, and came to an abyss; I saw clearly that nothing save destruction was before me. I began to make the greatest efforts to rush away from death. Thus I, a perfectly happy man, hid the cord from my own self, so that I should not hang myself on the cross-beam between the clothes closets in my room where I spent my evenings alone; I stopped carrying a gun with me, for fear that I might be tempted to rid myself of life in an easy way. I experienced a sense of horror before that which was awaiting me; I knew that that horror was more horrible than the end itself, but I could not wait patiently for the end. . . . The fear of the darkness was too great, and I felt like ridding myself of it the sooner thru the noose or with a bullet."

Tolstoy was saved from this fear of death, from despair and suicide by his coming in close contact and friendship with the Simple Believers, the poor Russian laborers. He lived intimately with the plain people for two years and he underwent a new change. The life of the wealthy and worldly people of his own circle became repulsive to him. All their acts, their discussions, science as well as art, all this arose before him in a new light. He now believed that it was all nonsense, that it was useless to look for a reason to justify it all. He believed that all he had learned, all he believed and loved was foolish and insignificant. Love toward one's neighbor, love for all

mankind, and self-sacrifice—these seemed to him to constitute perfect happiness.

"I began to despise myself and I recognized the truth," thus Lyov Nikolayevich ends his "Confession."

The great spiritual and moral revolution came over the great writer twenty-five years ago. Having recognized the truth, having renounced the falsehood of the world and the falsehood within himself, he at once entered the new life.

This life was the life of the plain Russian peasant from whom he learned a great deal, which led him to regard death with contempt instead of fear. He renounced everything which he called "unnecessary mischief." He stopped smoking, drinking wine, and used only a strictly vegetarian food, excluding even butter, milk and eggs. He began to wear coarse, home-made underwear and a plain blouse. He served himself, that is, he did all that he could do himself, considering it humilating to a man to humiliate another man by having him serve him and work for him.

This new method of Tolstoy's life was known in Russia as the "simplified life," and the followers of this method of life were called "Tolstovtsi." At first there were many of these "Tolstovtsi" in Russia, forming entire colonies, fraternal communes which attracted not only the enthusiastic youths who are generally attracted by every novelty and fad, but also attracted middle-aged and old people and people holding important positions. All this was very gratifving to Tolstoy. Rubbing his hardened hands, he would exclaim with delight "My fire must be real if it sets others aflame!"

But he was mistaken. his fire was not real, it kindled others for awhile, it flashed up as a sheaf of sparks and then it died out.

There are no longer any fraternal colonies in Russia, nor are there any "Tolstovtsi." Only one "Tolstovets" remained—Lyov Nikolayevich Tolstoy himself.

To Russians there are two Tolstoys within Tolstoy: one is the great writer, the novelist; the other is the philosopher, the thinker, the teacher of a new religion. As a novelist Tolstoy is worshipped in Russia, but as teacher of a new religion he is not recognized at all. Tolstoy himself, on the contrary, despises his artistic works, and holds in high esteem his philosophic and religious writings. Tolstoy considers himself as offended and misunderstood in Russia and he explains it by saying that " no man is a prophet in his own land," or in his own house.

For in Tolstoy's own home his doctrine has no followers even as it has none in his fatherland.

The rather vague and confused religious and moral doctrine of Tolstoy is in the end based upon evangelical truths, as interpreted by him and oddly applied to his own life. By his own example he wants to show us what is the truth in life. By his own acts he says to us: "Look at me—this is the way to live."

Let us see how Tolstoy lives.

A beautiful wide and shady alley of birch trees leads to the fine country house which is surrounded by a magnificent old park. The house is furnished in the old fashion, without any new contrivances, but in an exceedingly comfortable manner. In this house the master himself, Lyov Tolstoy, occupies but one room in the basement, which had been a pantry. The ceiling is vaulted, the floor is not painted, the walls are whitewashed with lime. In the corners are scythes and shovels. In the center of the room stands a large table, made of plain boards, at which he works; near the wall stands a bench with a leather pillow, upon which he sleeps. He takes his meals in the general dining room together with his whole family. Special dishes of vegetable food are placed before him on the luxuriously set table. He drinks nothing but water out of an earthen jug, calling it his "fine cider."

All this will lead to the conclusion that the picture of Tolstoy's new life does not correspond to the old frame in which it is set. One feels a false note in this life, which Tolstoy himself does not perceive, because he is sincere. He is convinced that his life is correct, and he does not consider it his fault that others do not understand and do not want to follow his example. People have censured him for continuing to live in his own house amid luxury, altho he declared that all property, and especially wealth, was an evil but he has been defended on the ground that he could not mend one evil by another evil, that is by giving away his wealth to the poor, thus

reducing his children and his wife to poverty against their will. He had hoped that he would convince them by his example that the road he chose led to Truth, and that they would follow him, but he was mistaken. They did not follow him, but he remained with them, and he lives, amid surroundings of rich ordinary people, his own life of a poor, solitary man.

With this new life Tolstoy became re-

TOLSTOY AS HE IS TODAY.

generated both in body and soul. Before he took up this new life he was weak, nervous, sickly, almost consumptive; now he has grown so strong that, notwithstanding his old age, he takes longs walks and rides on horseback for miles daily, in any weather; he chops wood and works in the field and the garden, and he feels vigorous at all times and knows no fatigue. He used to be capricious, quarrelsome and irritable; now he is at all times even-tempered, unusually calm and gentle with others. Everything within him has undergone a complete transformation—his character, his tastes, his instincts—as tho his very soul had changed. His tastes and instincts used to be of a rather cruel nature before; he found a peculiar pleasure in skirmishes during the war; the buzzing of the bullets filled him with delight and the smell of blood intoxicated him. He was a passionate hunter; he killed small and large game with pleasure; now he trembles with fear at the sight of blood and his heart is filled with compassion for every living being in nature. One summer interesting guests came to Yasnaya Polyana from St. Petersburg. They were distinguished journalists and statesmen. In the evening they were all seated around a table in the garden, drinking tea and discussing with animation certain important current events. Always so deeply interested in the latest news and the views of interesting people, Tolstoy was this time reticent and impolitely distracted, for he was completely absorbed not by his guests, but by the moths which gathered about the light of the candles, and which he tried to save eagerly, burning his fingers as he did so. When Countess Tolstoy ordered to cut down certain bushes in their garden for the purpose of making a new alley, Lyov Nikolayevich ran away from the house in order not to see this useless "bloodless murder," as he called it. Many people laugh at this sickly pity of the great old man, but in this case the familiar saying may be reversed: "There is but one step from the ridiculous to the sublime."

Everything in Tolstoy is too simple and too sincere to be ridiculous. He is not perfect, because he is human; but he is the greatest, the most powerful, the wisest and the kindest man in Russia.

He loves Russia with a profound and a painfully hidden love; he suffers for Russia both as a Russian and as a man. He does not take any active part in the movement for emancipation, but he observes it closely. He was silent for a long time, and only recently he broke this silence by writing three letters. The first was addressed to the Russian Government; the second—to the Russian revolutionists; and the third—to the Russian Czar. He blames the Government and the revolutionists alike and censures them for their harsh and senseless cruelties. As to the Czar, he entreats him tearfully for mercy and begs him to stop the executions. "Remove from yourself and from us the grave sin which has defiled Russia," he writes,

"and I, together with the entire nation, will bow before you and become your slave." This wail of entreaty remained "a voice crying in the wilderness."

Almost all of Tolstoy's artistic works were produced by him during the first period of his literary activity, before the spiritual revolution which transformed him. Of all his works "War and Peace" is the greatest in scope and the most remarkable novel. In it he depicted with a master mind the historical epoch of Napoleon's invasion of Russia in 1812. This novel is recognized as a wonderful masterpiece, which has no equal in art, and which is all the more wonderful because of its simplicity. The charming simplicity of Tolstoy's talent proves the rule that the greatest work is always the simplest work.

"Anna Karenina" is Tolstoy's second remarkable work. This novel is the best of Russian novels. The life of high society is mirrored in it intimately, simply and truthfully. All its characters are real, living men and women. A particular interest is attached to this novel because the author has portrayed himself in one of the principal heroes, and his wife—is the wife of his hero. The charming scene of the proposal, then the description of the appearance of their first child, and some other beautiful domestic scenes, were taken by the author directly from his own life and depicted in a masterly fashion.

Soon after the publication of "Anna Karenina" Tolstoy was changed by the spiritual revolution within him. Declaring novels to be worthless and useless works, he began to write exclusively religious and moral sermons, the most important of which are: "My Confession" and "My Religion." He believes in God and in the immortality of man as a particle of God whom he is to join in spirit. He feels himself within God and God within himself. He does not accept the Saviour as the Son of God, but he recognizes in him a great teacher of a great truth.

The great writer did not write any novels for several years. For several years he deprived those that appreciated lofty spiritual joy, of their pleasure—those that worshipped his genius, that loved to refresh and strengthen their souls by contemplating the productions of his genius were deprived of their greatest pleasure.

At that time the famous Russian writer, Turgenev, Tolstoy's former friend who later became his enemy, was dying. And this enemy sent the following message before his death to his former friend:

"My friend, take up your literary work again. For this gift of yours comes from where all gifts are granted. Ah, how happy I would be if I could only think that my last request in life would have this effect on you. 'My friend, great writer of the Russian land, grant my last request.'"

Turgenev's request produced its effect on Tolstoy and as result of it came "The Kreutzer Sonata," a powerful, original and daring work which created a stirring sensation in Russian society. In "The Kreutzer Sonata" Tolstoy touched the sacred institution of marriage, he showed all its monstrous defects, all the falsehood hidden beneath its moral surface. Since that time began the persecution of Tolstoy by the Church. The priests were ordered to attack Tolstoy in their sermons for his so-called abuse of the sacredness of marriage, this firm foundation of social morality.

Shortly after that Tolstoy wrote the charming story "Master and Man," and then he became silent again. In this story, which is highly artistic, the great master has described our Russian winter as no one has ever described it. The picture of the snow-storm is presented to the reader so vividly that it calls forth a real sensation of cold and fear before the enraged element.

Tolstoy's silence after this wonderful winter tale lasted for a long time, and finally he again broke his silence by another masterpiece, "Resurrection."

For "Resurrection," Tolstoy was excommunicated by the Church, and was anathematized for describing the sacraments during the Mass. Count Tolstoy never offended the name of Christ with a single word, he only attacked the servants of Christ for their hypocrisy, and for this he was excommunicated from the Church of Christ. Since then Tolstoy has been silent. We are waiting—we are waiting and hoping that the great, immortal writer has not yet spoken to us plain mortals the last word of all that which was so generously bestowed upon him by the gods.

ODESSA, RUSSIA.

The Regeneration of San Francisco

BY JAMES D. PHELAN

[Hon. James D. Phelan, ex-mayor of San Francisco, is one of the most energetic and progressive of the city's public men. During the troubled times after the earthquake he was at the head and front of the philanthropic and reconstructive movements and is, today, vigorously identified with the reform efforts. He is one of the rich men of the city, president of the Mutual Savings Bank, and connected with many other financial interests. No one is in a better position to understand the subject of which he writes.—EDITOR.]

THE destruction of San Francisco by fire following earthquake is an event of historical importance, and altho a year has past, still it is too soon to make a proper estimate of its significance, or to draw from it lessons of citizenship or even of building construction. The disaster of April 18th, 1906, may be likened to a stunning blow, which pains and staggers one, but from which recovery is speedily had and the stricken one rises again ready to resist the foe if he be present or to prepare to meet him and overcome him should he return again. What affected the imagination of the world was the earthquake. What concerned the San Francisco was the fire. The earthquake of itself has never done serious damage in California, but never before had it broken water mains; so, in the reconstruction of San Francisco, these mains will be erected on piles, as buildings are now erected upon made land; or, as has been vainly recommended by engineers in the past, constructed over marsh or made lands with flexible joints.

The water supply of San Francisco is mainly from peninsula sources, altho much water is drawn from across the Bay thru non-rigid piping. But the new water supply for San Francisco, which is well advanced in the minds of the people, will come from the high Sierras and be so conducted that there shall be little or no danger of damage to aqueducts whether of masonry or pipes. But for fire protection, pumping plants are already contemplated on the shores of the Bay, which half encircles the city, so that salt water will always be available. With a fresh and a salt water supply of abundant water, San Francisco can defy earthquake and conflagration. The people never lost their confidence in the ability of the city to recover itself and assume its imperial position on the Pacific Coast, nor was there any reason why they should. Doubt only entered the minds of those who were not familiar with the conditions.

The Bay of San Francisco fixes the necessity for the metropolis. The wharves, shipping and railroads were not affected by fire or earthquake and business was immediately resumed, slowly at first, it is true, but long since has it attained its normal proportions. The wholesalers established a new district and began doing an unprecedented business. The same is true of the retail trade, which at once established itself in locations untouched by the flames. There has not been a month in the last six months but that the bank clearings showed a marked gain over the clearings of the previous year. The people remained with their city and met new conditions with perfect equanimity and saw the evidence of undiminished business with pleasant surprise. The great mining, agricultural and horticultural resources of California tributary to San Francisco were unaffected by the disaster, and the commerce of the port, by the increased demands no doubt for building material, has greatly increased in volume.

It is estimated that 75,000 people took advantage of free transportation after the fire to go away, but most of them have returned; and those who were driven out of their homes and were not accommodated in the relief camps went to nearby suburbs where they are practically San Franciscans still. It can not be said, therefore, that the population of San Francisco has diminished. Indeed, it has been claimed that the population is substantially the same. It has been estimated that there are 37,000 houses in San Francisco and, according to the postal authorities, the aggregate number of

inhabitants in each house has increased from five to seven and one-half persons. This will give 278,000, regularly living in houses. It is estimated that basements, formerly unoccupied, are now tenanted by 100,000 more. There is, roughly estimated, 50,000 people living in tents, shacks, stables and other temporary quarters not recognized as dwellings, which makes a grand total of 428,000 people. There have been large accessions of working men in skilled and unskilled trades, architects, contractors and their families, and it must be apparent to every one that to rebuild four square miles of territory, which is now well under way, requires in itself, apart from other considerations, the presence of a large and growing population. Indeed, it has been argued by many that the disaster was a blessing in disguise. There was nothing destroyed that can not be replaced, and it has been recalled that Hawthorne condemned in European cities the noisome and unsanitary buildings, which have stood for generations, causing infection and menacing health. He said that a fire now and then, as in America, would do much to render foreign cities habitable. So with the fire in San Francisco, we had many old buildings, saturated with disease and unsightly relics of the hasty construction of the city in the early days, and they have now given way for better and modern structures. The laboring classes certainly have reaped the benefit from the opportunities which have been presented for work at high wages and the dealers in building material have found a more profitable market.

Real estate values in the business district have held their own and the assessor announces that San Francisco will pay about one-fourth of the taxes of the State. There has been a great demand for small residence building lots, and the workingmen are investing in homes. High prices for labor and material must necessarily restrict building, as being beyond the means of many, or reduce the size and character of the buildings themselves, and the principal sufferers must therefore be those who own land and are required to build and pay perhaps 25 to 30 per cent. more for construction than it would have cost them before the fire. But, on the other hand, rents are higher, and people build, confidently expecting commensurate returns. The man, however, who has his bare lot covered only by a mortgage is badly off and there are many such cases where expensive buildings occupying lots were inadequately insured, and very often in companies which have repudiated their obligations. The savings banks have applied the insurance money on their loans and are perfectly well secured, and are now advancing money at the rate of 5 and 5½ per cent. net for the purpose of reconstruction.

Of course the payment of insurance, which now aggregates 180 million dollars, was an enormous and timely help to banks and property owners. Few fire companies "welched," and it has been held by juries in the case of the certain English companies, which offered to pay from fifty to seventy-five cents, that the earthquake clause in their policies securing exemption for the companies from loss by "fire indirectly originating by earthquake," which could not be proved, was of no validity.

It is a remarkable fact that after so overwhelming a catastrophe the finances of the city have remained perfectly undisturbed. No bank has been embarrassed; no firm has suspended; and, so far, there has been an abundance of money; but for reconstruction the city will, no doubt, have to draw upon the East for funds, and to facilitate this purpose a Constitutional Amendment was adopted at the November election amending the mortgage tax law, which allows the debtor and the creditor now to freely contract for a net rate of interest, whereas before the creditor was obliged to pay the tax upon the mortgage, which, of course, he added to the rate. But it was something that interfered with the freedom of business and only served to keep much foreign money out of the State of California. California has always financed herself, and this is practically true of the city of San Francisco, whose saving institutions were capable of loaning at low rates of interest all the money necessary for ordinary building operations. The rate up

to the conflagration did not exceed 4½ per cent. net, and even now large loans are being made at 5 per cent.

The judicious distribution of the great relief fund by the corporation known as the San Francisco Relief and Red Cross Funds was an important factor in preventing want and setting people upon their feet and giving them courage for the conflict before them. By reason of the munificence of the East, $9,000,000 was made available, and no one suffered for food, clothing and shelter, and the small tradesman and professional men were speedily rehabilitated in their business.

The policy of the corporation was to meet immediate and pressing wants and to house the displaced population, but to prevent pauperization by requiring every able-bodied person to make a beginning again, and to that end made small grants of money for tools, implements and rent. For the disabled and helpless, of which there are now about 600 only, a large camp was provided in the suburbs, where racing stables were converted into temporary lodgings and good food provided three times a day. In the parks, 6,000 houses of two and three rooms each were erected, and contracts were executed by which the corporation would sell these houses to the tenant on the payment of $2 a room a month until August next, when they would have to be removed, and those who had undertaken to lease, contract for or purchase lots, the amount received in instalments for houses would be applied toward the acquisition of the land, whether secured by lease or purchase. So it is expected that, by next August, when the Park Commission will insist upon the removal of the cottages, a large number of people will have provided themselves with land, and can temporarily move their little houses, which will bridge them over for several years.

In addition to these, the corporation erected a better class of houses, ranging from $400 to $800, and contributes a fraction, generally not more than one-third, toward their cost. The balance the householder has to provide for himself, which he is generally able to do, as he owns the land, at a savings bank or trust company.

Another plan which operated advantageously was to give a bonus to every one erecting his dwelling in the burned district equivalent to one-third the cost of the house, providing the bonus should not exceed the sum of $500 in any one case. As a result of this policy, houses have dotted the burned district where people have gone back to their own homes. At the same time the Relief Corporation is aiding the rehabilitation of hospitals, settlements and like institutions which have taken up their ordinary work of caring for the sick and the unfortunate, who may require help and guidance after the Relief Corporation shall have gone out of business, and, by April 18th, one year after the disaster, the Relief Corporation contemplates closing all its work. Necessarily, there will be unfinished business, but no new business will be taken up.

During all these months, partly on account of the judicious use of the relief fund, there has been no real suffering, and the city has been singularly free from disease. The camps have been made sanitary both in their construction and in their care. The obligation of San Francisco to her Eastern friends, who so generously responded after that evil day in April, is great, and the good their contributions have done should be gratifying for them to hear.

The old and devastated business section of the city is beginning to call back, one by one, from their temporary quarters, the merchants who fled to the outskirts to preserve their patronage and the continuity of their trade. The large merchants have all engaged buildings in process of construction, almost invariably in the same neighborhood occupied by their destroyed establishments, and they cheerfully engage to pay more rent based upon a percentage of the increased cost of construction. So it is reasonable to say that, within two years' time, business will have been resumed on the old thorofares, and from that time on there will be a splendid progressive development of the old city. Already the banks, insurance companies and professional men have established themselves in the downtown office buildings, the principal ones having been restored at a cost approximately of 45 per cent. of their orig-

inal cost; that is to say, 45 to 50 per cent. represents the damage done the buildings of Class A construction—steel and stone—by the sweep of the conflagration.

But "purified as by fire" has a new significance for San Francisco. If it destroyed the accumulated microbes, according to the views of Hawthorne, it is also well calculated to destroy the entrenched graft of a corrupt and indecent administration, which had fastened itself upon San Francisco during the recent easy years of its prosperity. But when the band of brazen corruptionists pillaged the city of its legitimate revenues after it had been laid low, by the sale of franchises, the purified civic sense of the people recoiled in disgust and vowed vengeance. San Francisco is an easy-going city, but her history evidences that, while not easily roused, when roused she is wrought up in the extreme.

The two celebrated vigilance committees, in the ruder days of her early life, drove the thieves from the city and established good municipal government for a time; and later, after she had become the victim of "Boss" Buckley, civic reform had an inning for more than five years; and again, in 1902, when the Ruef-Schmitz combination made merchandise of public rights, it might have been forecast that the time would soon arrive when patience would cease to be a virtue and the old San Francisco spirit would be again roused.

Strictly adhering to the process of the law, a small number of men decided to collect evidence of the wrongdoing which everybody knew, but nobody was prepared to legally prove, and today Rudolph Spreckels, representing the citizens; Francis J. Heney, the redoubtable prosecutor of crime in high places, and William J. Burns, the secret service detective, stand as a living monument to civic virtue, and the efficacy of lawful methods when intelligently and persistently directed, to correct abuses in public office. A grand jury ready to do its duty was at hand. The elected District Attorney, William J. Langdon, was eager to do his share, and to the credit of our city may it be said that the Federal, State and municipal judges, with one exception, supported by prompt and righteous judgments the contentions of the District Attorney. Mayor Schmitz and his contemptible agent, Abraham Ruef, are under indictment, and the eighteen councilmen composing the Board of Supervisors have made confessions which incriminate also the public service corporations which bought privileges and franchises. The victory of good citizenship is complete and San Francisco will rise from the fire not only a greater city, but a better city and a model to American cities of good construction and good government.

So eager, however, were the business men to reconstruct their houses on their old lines, because of the necessity of meeting the demands of business and of rehabilitating their own fortunes, that at this time it is hard to concentrate the attention of the public upon projects of combined beauty and utility, as boulevards, diagonals and civic centers. These things always come after a city has proved its value as an emporium and when men have some leisure to indulge their tastes and imagination. San Francisco was ripe for it prior to April 18th of last year, but not until the necessities of metropolitan existence are first provided — homes, stores, warehouses, schools, public buildings and a municipal water system—will they turn their minds to the more engaging and attractive subject of esthetic gratification; but very soon will this come, because, as I have shown you, San Francisco is rehabilitated and its future is secure.

San Francisco has all the elements of greatness and is predestined to occupy fittingly the position of the chief city of not only the most resourceful of States, but of the greatest country on the largest of the world's oceans, serving the most numerous population on the shores of any sea.

Much has been given and indeed much shall be expected.

San Francisco, Cal.

My Red-Winged Neighbors

BY

D. LANGE

WITH PHOTOGRAPHS BY THE AUTHOR

OF all my wild neighbors that come and go with the passing of the seasons none are more welcome than the red-winged blackbirds. When winter and spring are still wrestling for mastery and when only the shallow margins of the ponds are free from ice, the jet black and bright carmine of my winged neighbors again brings life and color into the brown monotony of the dead rushes.

If, perchance, your eyes, dimmed by

THE HOME MARSH OF THE REDWING.

the gaslight of long winter nights, should fail to discover the newly arrived neighbors, their music will not fail to greet you as you hurry along to catch the suburban train to the big city. "Oak-ko-ka-lee-ee-ee," they sing. "Spring is winning, the birds are coming, the flowers are awaking."

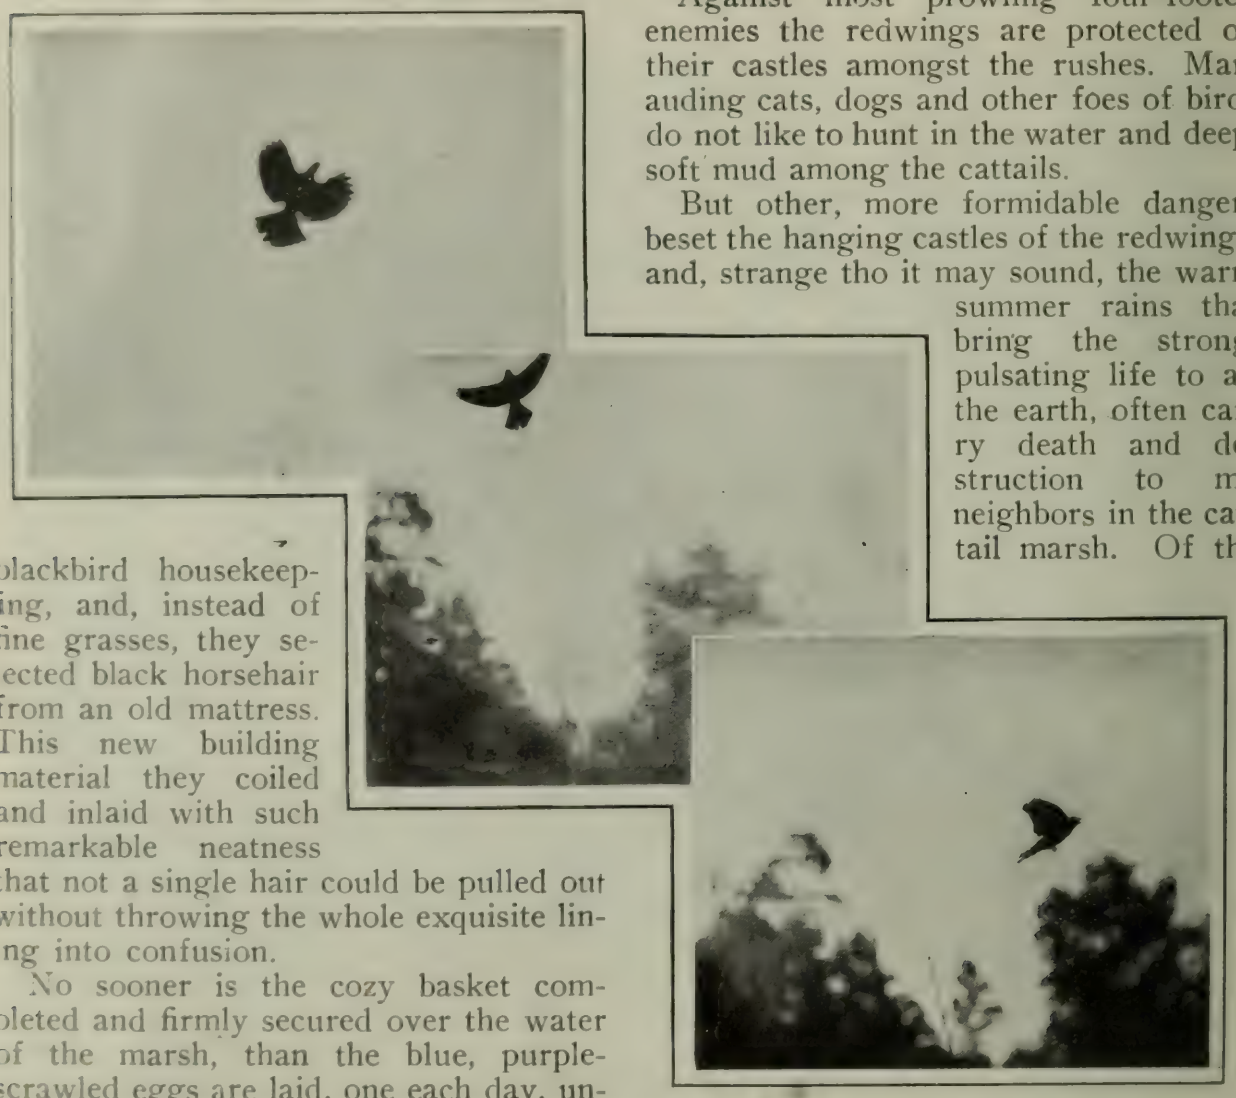
Whenever I pass the small cattail swamp, which the city engineer has forgotten to fill up, I hear the cheering refrain. I imagine that they are repeating it for the joy it gives them, or because their mates are still lingering hundreds of miles to the south, where genial, happy spring has already vanquished hoary, discontented winter.

At last their plain brown mates arrive, and before the warm winds of May, winter flees to the barren tundras of the Arctic regions. The red-shouldered pioneers have made good use of their time, they have explored every pond and swamp and every bunch of cattails and tussock of marsh grass, and after a few days of song and play each pair selects a bunch of reeds from which to swing the basket for their sapphire eggs.

A whole summer's work, joy and sorrow of my humble neighbors is bound up with the blue jewels that will soon lie snug in the felted, grass-lined cup. To attach a firm foundation to smooth, slippery rushes is a difficult task. Long blades of rushes and grass are gathered from shallow pools and are skillfully woven and twined around upright stalks and rushes, then this outside frame is filled with wet and half-decayed vegetation. All this wet building material soon dries in the spring sun and makes a compact felt-lined structure. And now comes the finishing of the home, to which the plain-winged mother devotes as much

GETTING A SNAP SHOT.

loving care as a human mother does to the little bed and soft flannels of her first-born. The finest dry grasses of the marsh are so neatly coiled in the felted cup, that no woman's skillful hands could do it half so well. Two of my red-winged neighbors were blessed with specially loving and intelligent wives. These broke with the ancient custom of blackbird housekeeping, and, instead of fine grasses, they selected black horsehair from an old mattress. This new building material they coiled and inlaid with such remarkable neatness that not a single hair could be pulled out without throwing the whole exquisite lining into confusion.



No sooner is the cozy basket completed and firmly secured over the water of the marsh, than the blue, purple-scrawled eggs are laid, one each day, until from three to five sapphire jewels may be seen in each basket cradle of the marsh.

And now all the love and vigilance and bravery of my neighbors is devoted to the protection of their jewels. Shy birds of wild marshes and sloughs tho they are at other times, now they become reckless of their own safety in their devotion to the specks of life that slumber in the frail blue shells.

No meddlesome jay or crow, no mischievous boy can approach their nests undiscovered. No matter how deserted the marsh may appear, a number of red-shouldered sentinels are always on guard Let an intruder appear on the scene and there is instant commotion. Dozens of angry, screaming and chack-chacking birds flutter around him, hover over him, and boldly peck at his head and eyes; and many a bare-headed country urchin has concluded that it was not safe to invade a blackbird marsh.

Against most prowling four-footed enemies the redwings are protected on their castles amongst the rushes. Marauding cats, dogs and other foes of birds do not like to hunt in the water and deep, soft mud among the cattails.

But other, more formidable dangers beset the hanging castles of the redwings, and, strange tho it may sound, the warm summer rains that bring the strong, pulsating life to all the earth, often carry death and destruction to my neighbors in the cattail marsh. Of the heavy downpour that converts the street gutters into torrents and raises the water of the marsh a foot or more, the eggs and nestlings have little to fear. Redwings' intelligence and instinct, developed thru long ages, can cope with this danger. Their suspended castles are always placed high enough above the water that, in several years of observation, I have never seen them drowned out. After brooding begins or after young birds are in the nests, the mothers cover the nests,

ON THE WING.

A TYPICAL REDWING NEST.

and the water from the clouds runs off their protecting wings so that eggs or young remain perfectly dry. Before brooding begins the rain is allowed to fall on the eggs, and the air dries them again without harm to their vitality.

Great danger, however, incomprehensible and unavertable, threatens the red-wing homes, when a long, continuous drizzle and heavy winds pass over the land. Against these conditions the instinct and simple intelligence of the birds are helpless. The slow, drizzling rain softens the dead cattail blades to which the nests are attached as to so many piles; at the same time the bulky nests become so watersoaked and heavy that the wind throws the top-heavy

THE NEST AMONG THE REEDS.

POSING FOR THEIR PHOTOGRAPH.

structures flat into the marsh, where the helpless young birds drown and the pretty blue eggs are devoured by snakes and turtles. In one instance I observed that nineteen nests out of twenty-four had been destroyed in this manner. The birds had simply not learned that the round cattail stalks are safe pilings in all weathers, but that flat cattail leaves are not safe in prolonged rains. All the

nests attached to the soft, flat leaves had been thrown down by the wind.

Young redwings, contrary to popular opinion about blackbirds, are fed exclusively on insects and insect larvæ; a large, gray cutworm being the favorite morsel of my young neighbors. Like all nestling birds, the little redwings feed so voraciously that they double their weight about every three days. If the proverbial appetite of the small boy were as great, a father would have to buy two fat steers a month for each of his boys.

When the young birds have feathered out, the nest begins to be too small for them, and one after the other leaves it, never to return to it. By this time nature has clothed them in a remarkably neutral garb, which makes them almost invisible as they hide among the rushes. I have carefully searched the small marsh, when I know that a dozen young redwings had recently left their nests, but I could not find more than one.

Within one month from the time the little brown mothers begin to brood the eggs, her children are full grown, independent blackbirds. During the period of incubation and growth, the life of the bird is beset by a thousand dangers and is subject to all kinds of accidents. If this period of danger were much longer the reedy, rippling song of my neighbors would be a rare sound, for few of them would survive to learn the tune of their fathers.

About the middle of July the young of the latest broods are able to fly, and now all the birds desert the small home ponds and marshes and assemble in large flocks, which sometimes look from a distance like whirling black clouds. Their season of hard work and anxiety is over, food is everywhere abundant, and for a few months their life is almost free from care. Nature offers them a bountiful harvest without exacting pay in the form of harder labor and longer hours. One day the flock visits a corn field where the young grain is just in the milk; the next day they scatter over the stubble of an oat field and feed on the waste grain which the farmer has left, or they feast on fat grasshoppers, which are easily caught on the open stubble. And when they tire of oats and corn they resort to the marshes of wild rice, nature's own crop, which seems specially planted for all the wild creatures that have learned to harvest it.

When night comes the birds from many miles around fly to some wild, lonely marsh, where they sleep in the rushes.

As the season grows colder they leave the Northern States, where marshes and lakes freeze up. How far South do they go from New England, Minnesota, Dakota and Canada? Some winter in old Virginia, others in the Carolinas and along the historic Ohio, while other flocks disperse over the boundless coastal marshes of the Gulf. One thing I do know: In all their wanderings they never forget the northern marsh, where their cradles were hung on the rushes, and the same south wind that brings back the robin's song also brings back the reedy "O-kalee" of the redwings.

ST. PAUL, MINN.

The Star

BY WILLIAM H. HAYNE

As watchers on a lonely hight
Behold the morning star,
So from the altitude of Faith,
Hope beams afar.

Tender and tremulous her light,
With golden rays shot thru,
It seems a heart-throb from the deep,
Unfathomed blue.

AUGUSTA, GA.

The Attitude of Japan Toward the United States

BY ADACHI KINNOSUKE

CALIFORNIA talks today of excluding our laboring class just as she did of the Chinese coolies in the classic days of Denis Kearney and his fellow orators of the Sand Lots There has been a deal of war talk among the American newspapers and the nervous old ladies called the conservative journals of Europe.

And while all this hubbub is going on its roaring way, what, pray, is Tokyo doing? Instead of talking of war, the Japanese Government has actually cabled our ambassador at Washington to step over to the White House and propose a convention. A convention on what? On the exclusion of the Japanese laborers from the United States. America was not asking us for any such convention. If ever there was a bitter pill for our national vanity to swallow, this convention certainly is one of the bitterest; it is no secret that we are not the least sensitive race on earth.

Why, then, this almost uncanny amiability on the part of the Tokyo administration toward this sad affair? Americans do not seem to be surprised in the least at this singular sweetness of temper of the Japanese Government; but they ought to. What is there back of it all?

Here is the way Tokyo read the unhappy incident at San Francisco: The union labor people of the Pacific Slope in general and those of the Golden Gate city in particular do not like the idea of working any more than they ought to and they have never thought that they were getting more pay than their work was worth; the coming of the Japanese working class would compel them directly or indirectly to work harder and, perhaps, for less money; they don't want the Japanese; they are doing everything they can to keep them out; today and very happily, they have the city of San Francisco in the hollow of their hands; they, the labor union people, have given the men in various municipal offices their jobs; from the mayor down to policemen, what are they but the creatures of their pleasure, their servants? Let them, the officials, then serve the labor unionists in this fight against the incoming of a race of people who may, seriously and in the end, make them work for every cent they get. All of which is the most natural move in the world on their part and no one can blame them.

A blunder was made. The Japanese residents of San Francisco took the school matter seriously; that is natural enough; our consulate at San Francisco took it seriously, too, which is not so strange; but a rather surprising thing was that our embassy at Washington took a similar serious view also. The result was that an affair none too dignified for the backyard gossip of a political junk shop became more than a talk of a frontier town; it became national; and ended up in becoming international. It is all very well for us to say, Why in the name of sense did not the Japanese consul at San Francisco, at the very first hint of the petty difference, step over to the Board of Education of the city and say to it—"Gentlemen, we know what you wish; in this matter as in so many others, you wish to serve your masters, the labor unions; they want you to drive out Japanese children from the common schools of the city; we can appreciate your position in the affair, at the same time the one pet failing of human nature, East and West, is to make a mountain out of a mole hill; now, give us a chance of taking an initiative in this matter; let us build a little school house for our own children. We shall say to our people that after the cataclysm, the city had none too spacious an accommodation for the American pupils; therefore we were obliged to build a little place for our own.

Meanwhile you can turn round to your masters and say "there are no Japanese children in the white schools of San Francisco." I say, it is very easy to say this and many another wise thing to our representative; but, then, it is just as well for us to remember that all of us are richer in hindsight than in foresight. Criticisms are cheap anyway. The Tokyo administration does not, as a usual thing, think it worth while to waste time in criticism; and on this particular occasion its comment came in the form of a cable advice to our Ambassador Aoki to propose a convention which had nothing whatever to do—from the skin-deep view of things—with the fencing out of the Japanese children from the schools. When you stop long enough to think it over, the wisdom of the Tokyo administration for the past thirty years is little short of miraculous. It saw that a blunder was committed; it did not stop to blame anybody; it left the amiable work of calling names to the San Francisco papers, which have nothing healthy about them but their lungs; it contented itself with the discovery of the root of all things evil—the effect of the introduction of Asian labor upon the temper of the labor unionists of the Pacific Slope. There was the trouble. And it proposes a convention for the exclusion of Japanese workmen; to abandon a clear right even before the fight is suggested. Is the Japanese Government a special institution, established for the sole purpose of comforting an unreasonable whim of American labor unions at the expense of the material interests of say two hundred thousand Japanese laboring class who may manage to come into this country within the coming ten years? Why not the same undaunted front which we had turned upon our friends, the Russians, a few years ago? It is the pleasure of the Californian to place us on the same plane with the Chinese and with the extinct race called the Korean. And we ask for an exclusion convention and beg for this sweet humiliation before anybody suggests it. Is Japan, then, afraid of America? When a question of national honor is before us, we would not hesitate a moment to take up arms against all the gods and the devils; let alone an earthly power. This is no rhetoric. When we declared war against China everybody thought, ourselves included, and even the most enlightened press of that torch-bearer of civilization called the United States, all thought that the Middle Kingdom had a rather light before-the-breakfast job; and today, we of Nippon certainly do not think that America is anything as serious a foe as Russia seemed to us in 1904.

Some wise people, gentlemen in the Foreign Office at Tokyo and some of your Washington officials, take you for innocent babies, and seriously tell you that it is the national policy of Japan to keep her working people at home, in Korea, and in Manchuria—in just that portion of the globe, in short, where she is more likely to be called upon to take serious measures. But reflect, for a moment, on this: We are supporting well-nigh fifty millions of people on 190,534 square miles (I have counted in everything, Formosa, Sakhalin, Pescadores), 60 per cent. of which are volcanic rocks unavailable for cultivation; while California supports not very much more than two millions on her 158,360 square miles; we are increasing at the rate of about 700,000 a year, our Californians at about 28,000. Don't you think that our country may spare a few hundred thousand laboring class to come over to this paradise of laboring people and share in its blessings? If you cannot give me a ready answer to this, reflect, for one more moment, on another point: Did not the Japanese Government allow, and is it not allowing all the laboring class of our country to cross over to the Hawaiian Islands without telling anybody of the precious policy of keeping our people in the theater of future play of our ambitions? Moreover the Tokyo Government has been and is now not at all averse to sending all the laboring class who wish into Australia, in which we have a rather distant chance of being called upon take vital measures. Certainly you can convince the servants of the Foreign Office of Japan of the sincere desire of the Nippon Government to keep the laborers away from the United States with the above argument, but it is meant largely for the marines and diplomatists. What, then, is the reason? Here is the answer: At pres-

ent Japan is stalking a big game—nothing less modest than a triple understanding between America, England and herself, not in American affairs or in matters European, but simply and solely over the Far Eastern situation. America—you will say before hearing me thru—would never hitch herself to Japan or to any other country as did England, in white and black. That is immaterial as far as Nippon is concerned; it makes no difference to her whether it be written or tacit, so long as the people of the United States would open their eyes wide enough to see that the slightest disturbance of the peace of the Far East is deadly for their interests—so fatal, indeed, that America would never, for one moment, countenance any move that may tend to that mischievous end, whatever be the source from which it might emanate. That is all that Nippon wishes.

Within ten years Japan will have worked her financial salvation in Korea; within ten years to come she will have defined her position in the development of the Chinese resources and also of Manchuria; within that period she is conceited enough to think to reap no small amount of profits from the Asian continental markets. At the end of ten years she will be a fairly rich nation. But the ten years' unbroken peace—ah, that is the *sine qua non* of her financial salvation. More—it is with her a matter of life and death, quite as serious as the cause which drove her into the bloody storm of 1904-5. To secure this uninterrupted stretch of peace is the prime end toward which the best efforts of Japan are tending today.

Japan, in her wisdom, does not make it a custom to sacrifice a point of supreme importance for one of secondary magnitude. The peace for ten years is the prime end. In the judgment of the Tokyo statesmen, the triple understanding is the means absolutely effective to bring about the end; America, Great Britain and Nippon together can impose peace on the Far East whether anybody else wishes it or not; and without kotowing every day to the pleasure of the Kaiser or to the whims of St. Petersburg. This creation of the supreme arbiter of the Far Eastern peace, then, is the star which glitters thru all the dreamings of Nippon statesmen of the day.

If the exclusion of Nippon laborers from the United States would please our American friends and help to bring about the supreme end in view, why—so say the Tokyo people—by all means let us send a few hundred thousand laboring class and their material interests to whatever place they please and smile with the best grace we can command at our petty humiliation; it is none too big a price to pay.

NEW YORK CITY.

The Last Stand

BY GRACE DUFFIELD GOODWIN

WHAT is all the fame you strove for
  Now you come to die?
All that walked within the sunshine
  'Neath the shadows lie.

All that climbed the steeps of power,
  Dizzy, nigh to fall,
Loosed their hand-grip in that peril
  That confronts us all.

Nothing counts you, nothing helps you
  When you leave the sun,
But the love that you have given,
  And the love you've won.

Death, I meet thee fearless fronted;
  This my bribe to thee:
All my living was in loving—
  Deal thou tenderly!

PAWTUCKET, R. I.

The Summer Show

BY FREDERICK A. THOMPSON

CREATOR, OWNER AND MANAGER OF LUNA PARK, CONEY ISLAND.

RUDYARD KIPLING, in "Captains Courageous," pictures the skipper of a fishing smack, searching for codfish, and says, that, in order to guess their whereabouts, he was thinking, not like a man, but like a wise old cod. He put himself in the fish's place, and therefore could find cod when all other skippers failed.

Now that is what the successful showman must do. He must understand the people who are to patronize him and must think from their standpoint.

When people come down to the seaside for an afternoon or evening of enjoyment they are not in a serious mood, and do not want to encounter seriousness. They have enough seriousness in their every-day lives, and the keynote of the thing they do demand is change. Everything must be different from or-

THE CHUTES, LUNA PARK.

TRAINED ELEPHANTS.

dinary experience. What is presented to them must have life, action, motion, sensation, surprise, shock, swiftness or else comedy. Twenty years ago the cyclorama, showing the Gettysburg battlefield with the dead, the wounded, the fighters and the clouds, all still, was very well, and attracted great numbers of spectators, but it would not do now. Now the clouds must move, the men must be living, the whole scene must be full of action, and so we have the diorama, which is a segment of a circle where the cyclorama was a full circle. The diorama is on the stage, with the spectators sitting in front, and the showman who gets the greatest amount of action into his scenes is the one who stands most chance of pleasing the crowds. The man who fails in action fails in everything.

When a stranger arrives at Coney Island, the great headquarters of summer shows, the first thing that impresses him is change—difference. His eyes tell him that he is in a different world—a dream world, perhaps a nightmare world—where all is bizarre and fantastic—crazier than the craziest part of Paris—gayer and more different from the everyday world.

This spirit pervading the whole place, strangeness and irresponsible gaiety captures the visitor and leads him along, and he is prepared to accept all sorts of extravagances—things that elsewhere would be impossible—in perfect good faith for the time being.

The summer outdoor public wants to be amused. At the Island we are not dealing with New Yorkers as they are in New York, but with big children who have come to fairyland and want the fairies to make them laugh and show them strange things.

Hence the trip to the moon and to Mars, the journey to the center of the earth, the descent into the coal mine, the floods and earthquakes and fires and battles are all real to the spectators while the experience lasts.

But in spite of this complaisant mood of the visitors, poor imitations of things represented will not do. To succeed,

whatever is shown or given must be the product of the highest art of its kind. The day of roughness and crudity has gone by, and no expense or pains is spared in making the spectacles, the illusions, the performances as perfect as they can be made.

The showmen have educated Coney Island's visitors till they are very discriminating, and the visitors have also educated the showmen. They have taught for one thing that the fun must

THE LILLIPUTIANS, IN "THE TRIP TO THE MOON."

be innocent—that it must be such as women and children can enjoy. It must be respectable. Coney Island is frisky, but it knows where to draw the line, and this knowledge is largely the result of the lessons given by the crowds themselves. The clean show pays; the other goes to the wall.

Coney Island as it stands today is the result of many years of evolution. No man planned it, no man foresaw it all. Like Topsy, it "just growed." It cannot be duplicated elsewhere, because of the immense cost that that would entail, as any one can see who considers the single item of transportation, involving all the railroads running to the beach. Our investment alone is about five million dollars. What other place on earth would dare to invest in electric lighting to the extent that makes Coney Island at night so notable and so beautiful? It has now four to one more lights than any other place of its size on earth.

And as Coney Island amusement enterprises have grown in size they have also improved in every way. The Isl- and is cleaner and straighter than it was. The tin-horn gambler has gone, the short-change artist has retired to the background, the gamblers, the swindlers, the pickpockets and the thugs no longer have their own way. At times we have 300,000 people visiting the beach in one day, with nothing worse happening than a few cases of intoxication.

Sometimes I am asked whether Coney Island makes any contribution at all to morality, and I say that decidedly it does. It makes the same contribution to the people who use it that the recreation centers in the public schools make to the

people who use them. Innocent play is a moral antiseptic, and innocent play has certainly won the victory at Coney Island. Whatever of the other may still be there has had to take to the caves.

Perhaps a few figures would be instructive to the reader, who may be able to gain from them a general idea of the extent of the summer amusement business. Our park embraces over thirty-eight acres, and employs 2,000 people, while the season's attendance totals up to 5,000,000 people. In order to get the place ready for the opening this year we had to employ 1,200 men building, reconstructing, renovating and beautifying.

A score or more of individual shows are on our ground, all new, and some of them costing as much as $60,000 each. These represent the very cream of all the ideas of amusement experts gathered within the year. Amusement suggestions come to us from all over the world, and are weighed, considered, sifted and tested, and at length, if they stand all tests, are proceeded with and so come into being, and yet, with all precautions, we may make here and there a failure, and in that case our work is to be done over again. The box-office receipts are the ultimate test, and the show which does not succeed there and succeed quickly must go quickly. No matter how much it cost the summer showman must instantly accept the fiat of his patrons, and "scrap" a show that does not draw well.

I have been all over and seen what Europe has in our line, and the nearest thing that I find to Coney Island is Blackpool, near Liverpool; but it is a long way behind. It is stiff and solemn, and its buildings lack the other-world suggestiveness of our Coney Island erections. Coney is frankly devoted to fun, the fantastic, the gay, the grotesque.

I believe that Coney Island in the past has been not quite well treated by the press. The papers give our police news far too much prominence. There is more space given to an arrest at Coney Island than would be the case had it occurred in any other portion of the city. I say that that is not fair, and I have been petitioning the editors to treat Coney Island police news as mere police news.

The Island deserves well of the people. It gives them bright days.

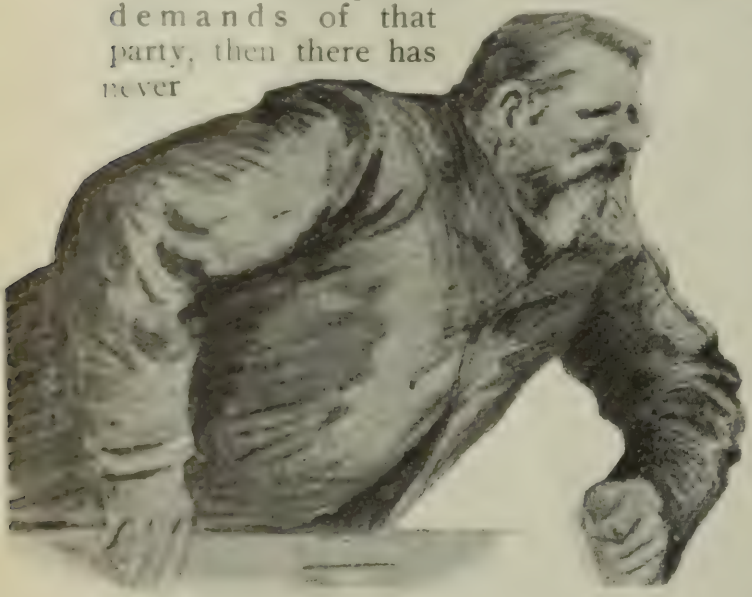
CONEY ISLAND, NEW YORK.

To Japan

BY SOMA GYOFU

TRANSLATED BY ARTHUR LLOYD.

THOU youthful keeper of the flower-beds,
Time was, when in thy small domains there stood
Not many flowers, but these of costly hue,
Which thou didst tend with single-hearted love.
But now thy borders are enlarged, and lo!
The beds are full with many an ill-matched flower,
And rare exotics from beyond the seas
Stand cheek by jowl with plants of native growth,
With cherry, plum, and tall chrysanthemum.
Distraction haunts thee in thy very dreams,
Thou know'st not which to choose, or this or that,
And naught is trim and neat as heretofore.
Ah! youthful keeper of the flower-beds!



TOKYO, JAPAN.

Socialist Ministers' Legislation in France

BY JEAN JAURÉS

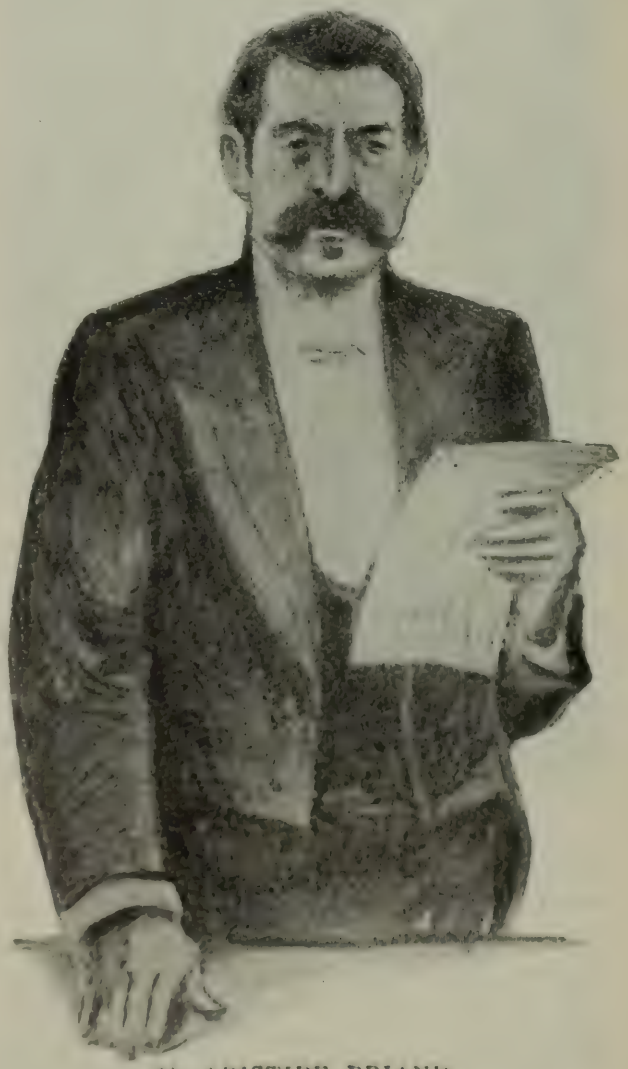
[The author of this article is the well-known orator and Socialist leader of the French Chamber of Deputies. The subject was suggested by us and the article has been written specially for our readers.—EDITOR.]

IF we understand by Socialist cabinet minister, a man put in office by the Socialist party itself and who agrees to conform his political conduct to the demands of that party, then there has never been a Socialist minister in France. We have had only cabinet ministers who belong to or who have belonged to Socialist organizations, and who have accepted a portfolio in their own individual name without any explicit authority of their party and sometimes even against the wish of the party.

M. JEAN JAURÉS,
Speaking in the tribune of the Chamber of Deputies.

The first cabinet minister of this kind in France was M. Millerand, who entered the Waldeck-Rousseau ministry in 1899. At that time the French Socialist party was not well organized, was not "unified," as it is, or nearly is, today, but was broken up into five distinct groups, which were often antagonistic. It is true that their representatives in the Chamber of Deputies formed one "parliamentary group," but they were not bound together by any authoritative compact. There were even some Socialist Deputies —M. Millerand himself, for example— who were not enrolled in any group and who, considering themselves "Independents," were responsible only to their own "Electoral Committee." Consequently, it was impossible for the Socialist party to have any authority as a body concerning the entrance of a Socialist into a "bourgeois cabinet." So when M. Millerand decided to associate himself with M. Waldeck-Rousseau, it was a mere act of courtesy on his part to inform the Socialist parliamentary group of his determination.

At this moment France was in the midst of the Dreyfus affair. The crisis was grave, the public mind was in a most confused state and the uneasiness of the friends of liberty was very poignant. So the idea of grouping together all the true republican forces, not excluding the Socialists, for common defense and for the general welfare, appeared very natural to the vast majority of the working classes of France. Even the most strict-constructionist Socialists showed only a theoretical objection to M. Millerand's act, and wished simply not to render their party, as a party, in any way responsible for what might be the outcome of this act. They would not have departed from this line of policy if M. Waldeck-Rousseau had not had the unfortunate idea of calling into his cabinet, as Minister of War, General de Gallifet, whose past was associated with the bloody suppression of the Paris Commune of 1871, with all the ill-feeling that this action awakened in the minds of the French laboring classes. This appointment did not tend to smooth the path of the new cabinet.



Yet, in spite of these various disturbing elements, a large majority of the French working classes wished well for M. Millerand in his new field, and the result was that he has contributed useful lessons to our recent political history.

He entered upon his work with several strong forces behind him. In the first place, he was laborious and methodical, and, in the second place, he was a "modern socialist," a reformer who was more interested in bringing about immediate changes than in poring over general formulas. He had never advocated violent measures and always said that he expected the social transformation to be brought about thru the influences of republican equality and universal suffrage. So there was no very startling difference between Millerand as a Deputy of the republican opposition and Millerand as a Minister in a cabinet of "republican concentration."

Besides his diligence and tenacity, the circumstances of the hour also added further strength to Millerand in his new rôle. The furious assaults which the monarchial and clerical forces were then making on the French Republic made welcome in the republican camp the support of the working classes, and thus enabled Millerand to obtain from republicans in general, and even from conservative republicans certain reforms and the passage of bills which would have been promptly voted down under ordinary conditions. In this way he carried thru three excellent measures.

M. Millerand got both houses of the French Parliament to pass a law making ten hours a legal workday for children and women, and for men who worked in factories where women and children also worked. Two-thirds of the laboring classes of France are benefited by this measure. The important feature of this legislation is the fact that then for the first time Frenchmen were cared for in laws of this nature, for heretofore only women and children were protected in this matter of the duration of the working day. Until then those whom the French civil code looks upon as minors—women and children—had alone awakened the compassion of our legislators. Extending protection to adult males was an absolutely new departure in our labor legislation, and the honor of this innovation belongs to M. Millerand, who had to make a hard fight to get the Senate to accept the reform. This was the thin edge of the wedge which is now making a still wider opening in this same field, for the Chamber of Deputies is going to discuss a bill which will apply this ten-hour law to all factories even where the hands are only men. This new measure will not only extend the scope of the reform, but it will prevent dishonest employers from evading the Millerand law, by separating by a partition or simply a curtain, the male from the female hands in the same factory.

A second successful piece of labor legislation due to M. Millerand's presence in the Waldeck-Rousseau Cabinet was his development of and his encouragement given to the labor "syndicates" or unions. He enlarged their influence in several ways. Thus, he instructed the official labor inspectors to keep in constant touch with these syndicates and to communicate to them, within a reasonable delay, the result of the inquiries undertaken at their request. Having decided that a normal scale of prices should be established for all work done for the

M. ARISTIDE BRIAND.

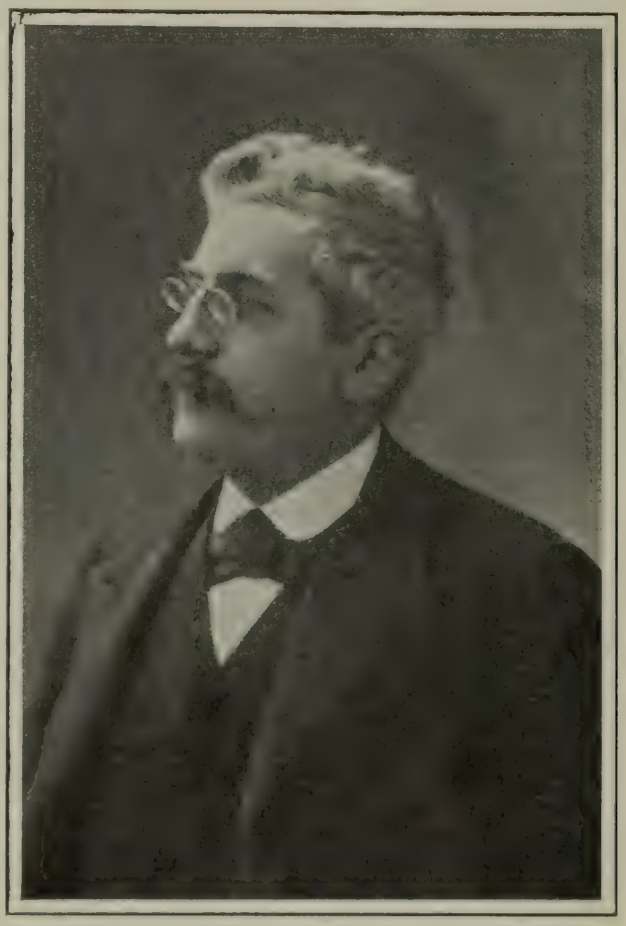
central, departmental or communal governments, he turned to the labor unions for the data necessary to decide what these prices should be. This gave an importance and an official recognition to these bodies which they had never enjoyed up to that time.

Another good move on the part of Millerand, in the interest of organized labor, was the nomination of a Standing Committee on Labor, whose duties it was to advise the Minister and aid in preparing legislative measures bearing on social questions. The membership of this committee was composed of representatives of both the employer and working classes, and, a fact which has its im-

M. JEAN JAURES.

portance, the latter were chosen, not by the suffrages of the whole labor element, not by the unorganized masses of the French proletariat, but by the syndicates, which was another recognition on the part of the French Government of the representative character of these bodies, which may now be considered as the official and legal mandatories of the working population of France, and which were greatly strengthened by these various acts of M. Millerand.

This innovating Minister builded even better than he knew. Thus, in several of the public services under his orders, and especially in the postal, telegraphic and telephonic services, which, in France, are all under Government control, he encouraged among the employees the formation of friendly societies, which differed only in name from the unions of the workingmen. Thus did the moderate Socialist, Millerand, prepare the way, without probably being aware of what he was doing, for the advent of the formidable syndical movement among French state functionaries which is at this moment perplexing the Clemenceau cabinet and which cannot be met, as is now being attempted, by stern laws pervaded by a spirit of mistrust nor by childish and reprehensible repressive measures; for in the near future no distinction can be made between the interests of employees, whether they be those of private enterprises and those of the state. Here, again, M. Millerand's advent to power was far-reaching in its consequences; and the end has not come yet.



And, finally, M. Millerand succeeded in getting the cabinet of which he was a member to bring in a bill concerning old-age pensions, the first in France worthy of serious consideration, and to get it discussed by the Chamber of Deputies. The salient feature of this measure was the way the pension fund was to be produced: a certain portion of the workman's wages was to be paid into the fund, the employer was to contribute an equal amount and the state the rest. Tho this bill was not past by the French Parliament, it was taken up again and bettered in a subsequent session and finally voted by the Chamber of Deputies last year, thanks to the vigorous efforts of the committee of which M. Millerand was the very energetic chairman.

From what has just been said, it will be seen that M. Millerand's presence in the Waldeck-Rousseau cabinet was not useless. Notwithstanding the mistrust which Socialists have of any good coming out of a "Bourgeois Government," a majority of our laboring classes are ready to admit that Millerand "did things." In fact, he did better in office than out of

office. If, on the fall of the cabinet, M. Millerand had taken his old place in the ranks of the Socialist Party; if he had not allowed personal ambition, however good was the ground for entertaining it, to outweigh the behests of his party; if, instead of trying to become prime minister, he had worked modestly to develop the strength, to complete the organization and increase the wisdom of the French proletariat, he would enjoy today a very strong, moral influence among the Socialists of France. If he had acted in this wise, he would certainly have hastened the hour when the French working classes will be strong enough, sure enough of themselves, and properly disciplined, to form and make live cabinets bent on social evolution. But unfortunately, he preferred to take "the solitary way" by which the daring climb to the hights of power, and the consequence is that he is still vainly waiting for the favorable moment to attain his ambitious end. I sincerely regret that his ambition is not elevated enough to surpass ambition itself. I regret this for his own sake, for he would then have been greater; and I regret it also for the sake of the working classes and for Socialism, which so sorely needs method, coolness, patience and persistent labor, qualities which M. Millerand possesses to such a high degree.

I have much less to say about the Socialist work of the two Socialist ministers in power at this moment. M. Briand has been at his post for about a year, since the formation of the Sarrien-Clemenceau cabinet, and M. Viviani came in a little later, when M. Sarrien withdrew, leaving M. Clemenceau as Prime Minister. At first blush, one might be led to believe that these two men would develop a bolder and more fruitful Socialist policy than did M. Millerand. At least, this might have been expected from M. Briand, who belonged to the most advanced and revolutionary wing of the Socialist Party. In fact, the Clemenceau cabinet as a whole appears more radical than the Waldeck-Rousseau government. M. Clemenceau's own act of creating a Minister of Labor, a portfolio so long demanded by the Socialists, and then putting at the head of the new department a deputy who was of Socialist origin, seemed to spread the Government sails to the Socialist breeze. But it is quite safe to say now, tho they have been in power so short a time, that Messrs. Briand and Viviani will not do so much for our party as did M. Millerand.

Tho it is true that M. Millerand did not enter office *with* his party, he did not enter office with his party against him. This fact has been pointed out above. But this is not the case with Messrs. Briand and Viviani. The Socialists are now "unified," and these two ministers took their portfolios in direct opposition to the formal prohibition of organized Socialism. This situation has greatly weakened their moral authority. They cannot bring much influence to bear on the cabinet nor on the Parliamentary majority when they themselves are disavowed by their own party. In fact, M. Briand came to power not because he was a Socialist, but for reasons that affect us only indirectly, because of his able and eloquent championing, as chairman of committee in the Chamber of Deputies,

M. MILLERAND.

of the law for the separation of Church and State. His past career as a revolutionary Socialist might have given new force and fresh stimulant to a man of a higher intellectual and moral fiber, but it has been a dead weight to this clever but mediocre and cynical intriguer who is now seeking to get into the good graces of conservatives by squarely repudiating his faith of yesterday and by furiously attacking his former party and his whilom political friends.

In further explanation of this backsliding tendency, it should be pointed out that the French Republic does not today so much need the support of the French proletariat as it did eight years ago at the time of the formation of the Waldeck-Rousseau cabinet, and the advent to power of M. Millerand. Now the majority of the Radicals, or rather the pseudo-Radicals, is so big in the French Chamber of Deputies that they do not fear the attacks of the Anti-Republicans or Conservative Republicans, and they cannot conceal their anger and hatred of growing Socialism. Even M. Clemenceau is too democratic in their eyes, and consequently the Minister of Labor, M. Viviani, in spite of his good intentions, has, up to the present time, been able to act only on the defensive. In a fine speech he supported the bill for Sunday rest, but finally had to let all the backbone be taken out of the measure. He managed to kill the proposed law hatched secretly in the cabinet which would have strangled the General Labor Union, but he did not oppose the scandalous prosecution of the syndicates state office-holders, whose syndicates met with his approval before he assumed office. How, then, could a vigorous and fruitful Socialist work spring from a cabinet where one of the Socialist ministers is a turncoat and the other forced into acts of weakness?

But what a strange pass our bourgeois republic has come to at this present day when cabinets cannot live without calling in Socialists even when the Socialists as a party deliberately decline to take office; when the republican majority not only turns to our model Socialists to bring about needed reforms, but even has recourse to the renegades of revolutionary Socialism to carry out expressive measures against the advancing hosts! The Third Republic utilizes our men of energy and even our traitors!

PARIS, FRANCE.

Pretty Kitty

BY HENRY AUSTIN

AROUND the world I've wandered twice,
But in its fairest city
I never found a girl more nice
Than merry little Kitty.

Her face is like a tropic night;
Her form is more than pretty;
Her eyes o'erflow with gypsy light;
A magic maid is Kitty!

Her lips look soft and sweet and bright;
They say bright things and witty;
They make me wish that it were right
To steal a kiss from Kitty.

For I'm a staid, old, married man,
Just fifty—more's the pity!
So, only in my fancy, can
Explore the lips of Kitty.

And she, no doubt, has got a beau—
Some youngster stout and gritty—
Who'd give my classic nose a blow,
If I should kiss fair Kitty.

Yet all men, sure, who see her charms,
Would like to turn banditti
And steal with fond, embracing arms,
Not a mere kiss, but Kitty.

But I, since years have rendered wise,
A youth once wild and witty,
Now strive to stifle all my sighs
With just a song on Kitty.

Tho had I the musician's art,
I'd set my song in some key,
That would unlock to me, the heart
Of pretty Kitty Kumpke.

PASSAIC, N. J.

Literature

Victor Hugo's Confession of Faith

In *Victor Hugo's Intellectual Autobiography,** Mr. Lorenzo O'Rourke has given us a graceful and scholarly translation of what will hereafter be regarded as Victor Hugo's ultimate Confession of Faith. The volume dates from the period of the great romanticist's exile in the English island of Guernsey, to which he fled when Napoleon III usurped the throne of France. It is composed of a group of rhapsodies on such themes as "Genius," "Life and Death," "Reveries on God," in which the most versatile of nineteenth century men-of-letters sets down his final convictions on art, on religion and on life. No great poet of modern times has so succinctly expounded the ideas that are fundamental to the whole of his work as Hugo does here. The only satisfactory analogy that occurs to us is the group of prefaces that Whitman published as the "Collect" in the definitive edition of his prose writings. It is of very little consequence whether one regards Hugo with George Moore as a gaudy "cross between an Italian improvisatore and a metaphysical German student," or with Swinburne as the genius from whom, in future generations, our epoch will take its name; in any case his work is seriously to be reckoned with, and the student of the "Leaves of Grass" could as wisely ignore the "Collect" as the student of Hugo's genius this postscript to his life.

It is, indeed, as a vade mecum for the student of Victor Hugo's genius that one is inclined to regard the book the moment after he lays it down; and yet it will make a far wider appeal. A few excerpts will indicate the drift of the Intellectual Autobiography. Hugo writes:

"Art, like flame, has a power of sublimation. Throw into art, as into fire, poison, ordure, rust, oxide, arsenic, verdigris; pass the incandescent matter thru the prism of poetry and you will have a splendid spectrum, in which the ugly will become the grand, and the evil become beautiful. . . . For the beautiful is nothing else than the holy light of goodness."

"Art is to man what nature is to God."

Of religion he declares that

"Just as the rays of the moon lose the figure of the sun and bring to us, instead of its image, a certain aspect of the medium thru which they pass, so the idea of God, reflected by religions and proceeding from them, loses, so to speak, the form of God and takes on all the more or less miserable configurations of the human brain. . . . In religion, I put God above dogma. If I were sure that this grave statement would be heard and understood seriously I would say that I am of all religions. I believe in the God of all men, I believe in the love of all hearts, I believe in the truth of all souls."

And his philosophy of a good life he summarizes in a noble passage which reminds one strongly of some of the more cherished utterances of Stevenson:

"Since it is given to no one whatsoever to escape the dream, let us accept it. Only let us try to have the right one. Men hate, are brutes, fight, lie; leave their dream unto the shadows. But share you your bread with little children, see that no one goes about you with naked feet, look kindly upon mothers nursing their children on the doorstep of humble cottages, walk thru the world without malevolence, do not knowingly crush the humblest flower, respect the needs of birds, bow to the purple from afar and to the poor at close range. Rise to labor, go to rest with prayer, go to sleep in the unknown, having for your pillow the infinite; love, believe, hope, live; be like him who has a watering pot in his hand, only let your watering pot be filled with good deeds and good words; never be discouraged, be magi and be father, and if you have lands cultivate them, and if you have sons rear them, and if you have enemies bless them—and with that sweet and unobtrusive authority that comes to the soul in patient expectation of the eternal dawn."

* Victor Hugo's Intellectual Autobiography (*Post Scriptum de Ma Vie.*) Being the last of the unpublished works and embodying the author's ideas on literature, philosophy and religion. Translated, with a study of the last phase of Hugo's genius, by *Lorenzo O'Rourke*. 12mo, cloth, 400 pages. New York: Funk & Wagnalls Co. $1.20

Twenty Years of the Republic

The need for contemporary annals is one that the careful historian cannot adequately meet, and yet it is one that must be met in one fashion or another. Professor Harry Thurston Peck has attempted, in his bulky *Twenty Years of*

the Republic,[1] to do such a work as that essayed a few years ago by Chancellor Andrews in his "Last Quarter Century," and that more recently accomplished by Miss Tarbell in her "Standard Oil Company." Professor Peck rarely reaches the standard set by Miss Tarbell, but his problem is vastly more difficult than hers, since he must take a near-view of all the complex activities of modern life.

As we contemplate the books which profess to tell the history of our own times we are forced to admit a preference for the reminiscence of the partisan rather than for the pseudo-history. There is a vigor about the personal narrative of the participator, or the political tract that has an end to prove, that is lacking in the non-partisan contemporary history. The times are too recent for us to know motive and working as we may after a generation of publication of correspondence, and the effort to be honest squeezes the life out of the narrative. The better the contemporary judgment the less its literary color.

Mr. Peck has tried to substitute anecdote and gossip for ascertained motive. He seems to realize the impossibility of proving from their own lips the inner motives of men now living, so he gives instead gossip, like an historical Boswell. He has a considerable degree of success in this. Mr. Roosevelt appears in his pages as a real man; whether as *the* real man it is too soon to say.

The author is so upright in his judgments that he sometimes leans backward. The wisest of us cannot tell what is the present historical truth, as an historical method, to soften harsh opinions and to weaken all high praise, as Mr. Peck constantly does, fails to leave the desired impression of mature and unbiased judgment. It makes us feel, as it is, that it is often careful trimming rather than actual knowledge. And so we personally prefer the work of the avowed partisan.

As for the course of the narrative in describing the external events of the years 1885-1905, there is little need for comment. The Cleveland, Harrison, McKinley and first Roosevelt administrations are all discussed in some detail. The war with Spain is subdued to something like its proper space—50 pages in 750—and some of the greater mistakes in current popular opinion are corrected. The author is happy in his accounts of and comments upon "yellow journalism" and its effects. He is less successful in portraying the influence of the great corporations in recent years. He is still orthodox, in the popular sense, upon the Monroe Doctrine, in spite of the views of his colleague, Professor Burgess, of whom he ventures to speak as one of the three great historians of our time.

Professor Peck's annals are as good as we can hope for today. We find no intentional bias in them and some excellent portrayals. We cannot hope, for the present, to have our immediate needs better met.

[1] TWENTY YEARS OF THE REPUBLIC 1885-1905. *By Harry Thurston Peck.* New York: Dodd, Mead & Co. $2.40.

Two Histories of the Reformation

THAT after the lapse of three and thirty years a revised edition of Professor Fisher's *History of the Reformation*[1] has been brought out, is a sign both of the enduring quality of the work, and of the vitality of its octogenarian author. The book has been reset in clearer type; the notes and especially the excellent bibliography show keen interest in the publications of the past ten years; tho it must be confessed that the literature of the previous twenty find a scantier recognition. The text shows many minor changes, but as the title-page states, it is simply a revision.

Principal Lindsay's two volumes[2] are a notable product of Scotch scholarship. In the twelve hundred pages at his disposal the author has not tried to pack all that might be said of the religious revolution of the sixteenth century; he has selected the outstanding aspects of the great movement. After sketching the mediæval papacy in its somber grandeur, the first volume considers the political,

[1] THE REFORMATION. *By George Park Fisher, D.D., LL.D.* Emeritus Professor of Ecclesiastical History in Yale University. New and revised edition. New York: Chas. Scribner's Sons. $2.50.

[2] A HISTORY OF THE REFORMATION. *By Thomas M. Lindsay, M.A., D.D.* Principal, The United Free Church College, Glasgow. *I. The Reformation in Germany. II. The Reformation in the Lands Beyond Germany.* International Theological Library. New York: Chas. Scribner's Sons. $5.00.

social and intellectual organization of the Roman Obedience, and enters sympathetically into the family and popular religious life before the Reformation. Luther, representative of "the simple evangelical piety which had never disappeared in the mediæval Church," we see in the cloister, we hear at Worms, and we follow him to his grave. The author avoids hero-worship, however, and does substantial justice to the other theologians and organizers of the Lutheran Churches in Germany, Denmark and Scandinavia. The second volume treats the Reformation outside Germany, from its beginnings under Zwingli to its classic development under Calvin and his disciples. Then follow the Anglican Reform, Anabaptism and Socinianism, and the Counter-Reformation. A large folder map and a chronological summary complete the work.

Dr. Lindsay has laid under tribute the wealth yielded by the formerly sealed archives of the Continent, and in his search has gone beyond State papers and theological tracts to the popular literature of the time; thru the folk-songs and hymns he makes us feel the pulse-beat of the people. The author is instinctively concrete; he sees too clearly to pine for paradox or itch for epigram. He holds the attention not by trenchant rhetoric as did Macaulay; his strength lies rather in spontaneous sympathy, tempered by Glasgow Presbyterianism. He cannot help glowing for Calvin, Knox, the Huguenots and the dyke-cutting Dutch; he enters reverently into the religious life of the plain people in undivided, Catholic days; but his appreciation of the *Spiritual Exercises* of Loyola is less ardent than canny. Apart from about a dozen errors of detail the chief defects of the work are the occasional outcropping of an instinctive dislike for "Romanism," and a certain depreciation of the importance of the Socinian movement.

The book is good reading; in parts, absorbing. Rarely has the enthusiasm of the writer led him into overmuch detail, as in the description of the ramifications of Genevan politics before Calvin; seldom does he repeat himself, and then chiefly in regard to the variant theories of the Eucharist, a subject so abstruse as to bear reiteration. In dealing with doctrine he shows the resourceful expository power of the expert, and his pages provoke thought. Dr. Lindsay's history deserves to be widely read by ministers and theological students, who will find it full of ethical and religious suggestions; and the swing of its style and its subordination of the technical to the vital will make it for the general reader the standard English work on the subject.

A History of Tapestry

THERE have been valuable books upon tapestry written by French and German students, but they have touched lightly upon the history of English tapestries. Müntz, in his "Short History of Tapestry from the Earliest Times to the End of the Eighteenth Century," a translation of which was published in England more than twenty years ago, gives some instances of early English work of the tenth century, and he hints at pictorial weavings brought or sent to England; but, with the exception of the Mortlake industry, he gives small credit to English weavers for high-loom work. It was well for Mr. Thomson to make his extensive study of tapestry* and to enlarge specially upon the treasures of the loom that once adorned English castles and palaces. Ancient inventories of princely collections prove how rich the country once was in these works of art. They were carried to England from conquered towns or castles as spoils in the French wars; they were sent as gifts from Continental rulers to English princes or church dignitaries; they were ordered from noted weavers in the Low Countries with designs to commemorate English history; and tapestry workshops under native direction with native and with foreign weavers were established by English nobles.

Four colored plates represent tapestries of the fifteenth and sixteenth centuries. The two of the earlier date, preserved in Hardwicke Hall, are owned by the Duke of Devonshire. They are hunting scenes of great interest, crowded

* A HISTORY OF TAPESTRY FROM THE EARLIEST TIMES TO THE PRESENT DAY. *By W. G. Thomson*, Examiner in Art. With four plates in color and numerous illustrations in black and white. New York: G. P. Putnam's Sons. $12.00.

with figures, rich in color, and are said to be the best examples of their period in England. Fragments of four hunting pieces were collated some years ago under the supervision of the present director of the Metropolitan Museum, Sir Purdon Clarke, and have been successfully restored, the original colors having been copied from the tangled web at the back of the fabric. The two remaining colored plates represent Flemish work, rich in decoration and sparkling with gold and silver threads. One of these tapestries, "The Adoration of the Eternal Father," is the property of Mr. J. Pierpont Morgan; the other, "The Adoration of the Infant Jesus," belongs to the Victoria and Albert Museum. These plates are reproduced from water-color drawings, three of which were made by the author himself. The fourth is by Ada and Blanche Hunter. They are remarkably well executed and give with rare fidelity the superb quality of the tapestry they represent. Mr. Thomson has founded his work on documents in national archives, in the British Museum and in private possession, and the result of his investigations has been the discovery of English manufactories never before chronicled in books of tapestry.

Because of its size and historical interest the "Bayeux Tapestry," so called, always finds recognition in histories of this art, tho it is wrought with a needle, and can only claim to be embroidery. If these writers would but go a step farther and devote some pages to the noted *opus anglicanum,* which acquired widespread fame thruout Europe during the thirteenth and fourteenth centuries, it would benefit many students who have small opportunity to see early English embroidery. An interesting collection of this work was shown at the Burlington Fine Arts Club, in London, a year or two ago, but pictorial illustrations of early English embroidery are rare in books.

The history of tapestry, beginning in the Far East, comes down thru the Greeks and Romans to Gaul or thru the Saracens by way of the Crusaders to Europe. It was preserved by the monasteries until tapestry became the handmaid of religion and of literature. It kept before the eyes and in the mind of the ruling class of kings and nobles, who had small clerkly lore, Greek and Roman myths, Bible stories, lives of the saints and tales of romance. In the course of centuries the art centered in one country of Europe after another, now in France, now in the Low Countries, now Italy, now England, moving here and there over the map as the shuttles of its weavers moved among the warped threads of their looms When the power of the Church weakened this art and craft, like other industries, slipped out of the monastery's grasp, and high-loom weavers became independent workmen, only binding themselves together in corporations under self-imposed rules, for bettering the craft.

In the fifteenth century a tapestry weaver packed up his looms and materials, went with his journeymen to the town where his client lived and remained, for months or years, as the case might be, to do the work under his patron's eye. We may read here, to the minutest detail, how the work was begun and carried on. A priest versed in the legends of saints wrote a series of incidents to illustrate the life of a saint. A painter translated the story into a series of small pictures; the seamstress and the chambermaid sewed sheets together to form the requisite size and shape, and the painter, with the aid of the illuminator, painted upon their surface the cartoons. These cartoons became the property of the weaver, who used them again and again, but varied the fineness of the work, the costliness of the woof and often the design, to suit the price.

The history of tapestry is full of interest, full of surprises and always spiced with romance, and Mr. Thomson has not spoiled the story in its telling. Nevertheless, he does not disguise the fact that painters who counted themselves the best friends of the art have sometimes proved its direst foes. He leaves us to question whether the divine Raphael himself did not set the craftsman's feet upon the downward road when he tempted him, by the beauty of his cartoons, to imitate brushwork with its subtle gradations of color instead of boldly translating the painter's pigments into the less flexible but more decorative terms of woolen, silk and gold and silver threads.

International Law and Diplomacy of the Russo-Japanese War. By Prof. A. S. Hershey. New York: The Macmillan Co. $3.00.

This is a scholarly and authoritative volume, altogether unlike the popular books on this over-written war. Yet it is one that even those who are not students of international law may read with interest. The only books to compare with it in comprehensiveness and accuracy are Lawrence's "War and Neutrality in the Far East" and Asakawa's "Russo-Japanese Conflict." Upon reading the first few chapters of the volume before us one can see, however, that even Professor Asakawa's concise digest of the causes of the war can be redigested with profit. The work is, as its title shows, a serious attempt at reading the history of the war in the light of the law of the nations. As for the fairness of it, one can hardly see how either Russia or Japan can complain. There is only one point in the entire range of the author's review of the war in which he does not uphold the action of the Japanese Government as stoutly as any Japanese could. That point is the "Ryeshitelni" case, "an undoubted violation of Chinese neutrality and of the law of nations on the part of Japan." The author defends the action of the Japanese Navy in the Chemulpo affair of February 9th: "The complaints of Russia on this score, altho theoretically sound, were, therefore, practically absurd." The contention of Japan is that the two incidents are identical so far as the law of neutrality is concerned. Does the author justify the Chemulpo affair on the ground that "the maintenance and the independence of territorial integrity of Korea is one of the objects of the war"? The territorial integrity of China was not a whit less an object of the war to compel Russia to withdraw from Manchuria, a Chinese province. Does the author hold that Japan promised to respect the neutrality of Chinese territory outside the area of immediate hostile operations in Manchuria, and therefore was guilty? But, as the author himself points out, the consent of Japan to the famous Hay Note was conditioned altogether upon the action of Russia; as long as Russia respected the neutrality of Chefu, and, in fact, even after she established a wireless telegraph station and converted Chefu into a base of communication, Japan was patient and inactive until the extreme case of "Ryeshitelni" arose.

The Tariff and the Trusts. By Franklin Pierce. New York: The Macmillan Co. Pp. ix, 387. $1.50.

The publication of this book furnishes an excellent campaign document for a non-protectionist political party. What are commonly considered the leading economic and political fallacies underlying the protectionist policy are intelligently exhibited by a plentiful citation of facts and figures and thru direct and separate appeals to the interests of manufacturers, laborers and farmers. The book is not, as the title seems to indicate, limited to a discussion of the relations of the tariff and the trusts. The broader aspects of protectionism are treated with a view to ascribing to the present tariff the existence of all the evils known to industry and government. The writer ignores the fact that trusts exist in industries that have not been directly affected by the tariff, and that many of the evils ascribed to protectionism prevail in free trade England. Moreover, Great Britain, with absolute free trade, suffers from what appears to have become a chronic state of unemployment, whereas protectionist Germany is experiencing an era of industrial prosperity. The most effective arguments of the writer against protectionism are found in the chapter relating to the effects of the tariff on American shipping. That protectionism is a potent cause of the backward condition of our shipping can hardly be denied by even the stanchest advocates of the present tariff system. High duties on imports not only increase the cost of shipbuilding materials, but also hinder the expansion of commerce by shutting out imports and thereby shutting in exports. But despite the fact that a system of free trade would undoubtedly extend our foreign commerce, economic progress or depression cannot be gauged solely by the volume of imports and exports, inasmuch as imports and exports are affected by home consumption as well as by foreign demand for our products. The author's arguments based upon the comparison of the volume of exports and

imports at different periods and of different countries should accordingly not be accepted as conclusive of the economic evils of a protective system.

Literary Notes

ANY of the books reviewed in THE INDEPENDENT will be sent by us on receipt of price. It is sometimes a convenience to readers in renewing subscription to include the money for some book wanted.

....Mr. W. H. Mallock's attack on socialism now running in the *North American Review* has received replies by two prominent socialists, Mr. Morris Hillquit, in a pamphlet published by the Socialist Literature Company, New York, and Mr. Gaylord Wilshire in one published by the Wilshire Book Company, New York.

....A small volume of comely and attractive form is Dr. Lyman Abbott's plea for optimism and good cheer entitled *Christ's Secret of Happiness,* which, Dr. Abbott urges, "is character. Each quality or attribute of character has its own peculiar blessedness. To interpret this truth as it is affirmed by Jesus Christ in the Beatitudes is the object of this little volume." (Crowell & Co. 75 cents.)

....*Tent and Testament* is the story of a camping tour in Palestine made by Mr. Herbert Rix. (Imported by Charles Scribner's Sons. $2.50.) Mr. Rix made a number of excursions off the beaten tourist track, observed carefully and compared his observations with the remarks of the best students, and was skilful and fortunate with his camera, a large number of lifelike photographs adding value to his story.

....In *A Practical Guide for Authors,* William Stone Booth has amplified his earlier volume, *Notes for the Guidance of Authors,* issued thru the Macmillan Company, in 1900, and the present book gives all the information needed by one for the publication of a book and the preparation of manuscript. Mr. Booth writes with authority, having full and very helpful knowledge of his subject. A considerable portion of the present book has to do with American and various foreign rules for spelling, punctuation, etc. [Houghton, Mifflin & Co. Boston. 50 cents.]

....We hear the word "poise" from a large number of nice people, who would be unable to tell what they mean by it. Mr. William Anthony Spinney tells us what it is in *Health Through Self-Control,* and asserts that "Health is a habit," and other startling statements, some of them founded upon the experiments of Mr. Horace Fletcher. (Lothrop, Lee & Shepherd Co. $1.20.) Other paragraphs are less sane, altho more amusing. As a rare example of pseudo-science we quote the following: "It is said by . . . an authority in physiology and psychology that a person indulging much in eating red beets grows jealous; eating green peas, joyous; carrots, mild; turnips, despondent, mad. *The chemical ingredients* in these, *complementing the colors* (!) produce these effects." There is much more of such nonsense in the book.

Pebbles

IF a pup would always remain a pup, we would buy one.—*Atchison Globe.*

THE FARE—How dare you use such terrible language to the poor horse!

Cabby—Can't 'elp it, mum, but if you wos a real lady you wouldn't understand it.—*Ladies' Home Journal.*

A PURIST he,
A rustic she.
His nerves were somewhat torn
When she did say
In artless way,
"Yes, Harold, I am yourn."
—*Washington Herald.*

MEN, think this over: Can you remember the first time you wore trousers?
The first time you tried to smoke?
The first girl you were in love with?
The first time you kissed her?
The first pair of long pants you wore?
The first dress suit you had on?
The first dollar you earned?
The first stiff hat you donned?
The first time you proposed to a girl?
The first time you were sent for milk and drank some on the way home?
The last time your daddy tanned your hide.
—*The North American Review.*

AT the annual meeting of the American Philosophical Society, *Science* reports the following papers were read: "The Influence of Imperceptible Shadows on the Judgment of Distance," by Prof. E. B. Titchener; "The Liver as the Seat of the Soul," by Prof. Morris Jastrow, Jr.; "Charts Illustrating the Taxonomic Relations of the Monocotyledonous and Dicotyledonous Plant Families," by Prof. John W. Harstberger, and "The Groups Which Are Generated by Two Operators of Order Two and Four Respectively, Where Commutator Is of Order Two," by Prof. G. A. Miller.

MAYBE I WAS.

WHEN I see a youth with his pants turned up and his beautiful socks on view,
And over one eye perched a little, round hat, with a ribbon of mauve or blue,
And the fourteen rings and the seven pins that he got at his dear prep school,
Why, it strikes a chord, and I say: "Oh Lord, was I ever that big a fool?"

When I see a youth with his gloves turned down and a cigarette stuck in his face,
And a loud check coat and a horse-cloth vest and a half an inch wide shoe lace,
And a bunch of hair that hides his ears, and a line of senseless drool,
Then I paw the sward, as I say: "Oh, Lord, was I ever that big a fool?"
—*The Daily Princetonian.*

Editorials

Bellum Delendum Est

But whether the delegates at The Hague will comprehend the full purpose of their meeting is quite doubtful. It is not that they may decide what property shall be sacred in war, or how war may be made less warlike, but how war may be abolished; and this is the purpose which the people should keep before them, whatever the Governments may have in view. Every ruler declares that he and his country are all for peace, and then they build more ships and stronger forts and drive their young men into the army, as if they were all for war.

When the first Conference met the question of ending war was not presented in the proposals, and the United States had to press the topic on the unwilling delegates. But now the offer to the nations of a plan of arbitration instead of war is the best part of its work; we might almost say the only part which the world cares to remember. So now the program is of the same slender sort. The topics now presented are such as these: The inviolability of private property of belligerents on the ocean; the rights and duties of neutrals; the use of new types of military and naval guns; and the bombardments of seaports in times of war. These proposals have in view the alleviating of horrors and the blunting only a little the Devil's spurs. Certain other proposed points do have a little bearing on the abolition of war, or, rather, limiting its occasions. One will have to do with perfecting a treaty of arbitration, and another will concern the question whether one nation shall collect by force the debts owed by another. The question of reducing armaments is not likely to be seriously considered—or, at least, certain Governments say they will not consider it. Germany, for example, is sure she has not a big enough navy and will not consent to forego its purpose to prepare for a war with a naval power. It is very much to be doubted whether Japan, which feels that she must be ever on guard against Russia and perhaps China, would give her consent to any reduction. Indeed, it is this matter which she has in mind, probably, when she reserves the right to withdraw if at any time a useful result is not probable.

Yet the one end is the absolute abolition of war. It stands behind all other discussions. That it is which is meant when it is proposed that the Conference shall have a permanent home at The Hague, and shall meet automatically and regularly to settle the affairs of nations, and thus to create, in time, an international parliament, a legislature as well as a judicial tribunal for the world. That is the ultimate object in view, not always confessed, but always understood by those prophets and seers who announce what ought to be, and so create the public sentiment which statesmen must in the end obey. *War must be destroyed*, and what must be shall be.

So great is our interest in this subject that we have sent Mr. Hamilton Holt, of our editorial staff, to The Hague to study the work of the Conference on the ground, and meet with its members, that The Independent may be better able to serve its readers in the cause of international peace.

San Francisco's Rascals

Mayor Schmitz has been convicted. Ruef had already confessed his guilt. He will not escape punishment, altho his testimony against other scoundrels will be counted to his credit when the inevitable penalty is exacted. Thus the forces of law and order and righteousness in San Francisco have made a good beginning in the courts. But it is only a beginning. The prosecutors now see before them their greatest task. It is to convict and punish the millionaire givers of bribes who bought the weak Mayor and the clerks and blacksmiths and hackdrivers of the Board of Supervisors.

It was a comparatively unimportant transaction—this one which has brought

Schmitz to the gates of the penitentiary. Five restaurants were compelled to pay $5,000 for a renewal of their liquor licenses. Ruef was the go-between, and he shared with Schmitz the money thus extorted. This indictment and the similar one against Ruef were the first to be tried, because they had been the first reported by the grand jury. But both these men are accused in scores of later indictments of receiving large bribes from the officers of public service corporations, and of bribing the Supervisors in the interest of those officers. When they come to be tried on these indictments, they will stand with the rich bribers, and the prosecutors may find that the influence which will be exerted for these bribe-givers will be used also for Schmitz, if not for the confessing Ruef.

It will be observed that the money was extorted from the restaurant keepers two years and a half ago. It is known that in the same way Schmitz and Ruef sold their protection to vicious resorts of the foulest kind, and in some instances even shared in the profits of them. Thus did Schmitz become qualified to protest against the presence in the public schools of a few innocent and well-behaved Japanese children. With money in his pocket that had been paid for the protection of brothels, by the side of other money corruptly received for public service franchises, he became the virtuous leader of the rascally Supervisors and others who professed to fear that their children would be contaminated and demoralized by association in school with the little Japanese! And this is the man who journeyed to Washington as a kind of ambassador to negotiate with the President an agreement involving, in return for some concession from the bribe-takers and vice-protectors who held office in San Francisco, a restriction that could scarcely fail to be regarded as humiliating by a proud and friendly nation. We understand that in the penitentiary Schmitz will not be exposed to the contaminating influence of Japanese associates.

Because of a statute enacted at the suggestion of Ruef for the protection of certain election commissioners of his own kind who were in danger of prosecution, Schmitz cannot be ousted from the office which he has disgraced until his conviction shall have been confirmed by the court of last resort. For a time, at least, the duties of the office will be performed by some one of the bribe-takers in the Board of Supervisors. At first thought this seems unfortunate, but it should be remembered that all of these Supervisors are under the control of the prosecutors and their associates in the movement for reform. Indictments, based upon their own confessions, hang over the heads of seventeen of them. The Supervisor whom they shall appoint to act as Mayor will do the work honestly. He will not dare to go astray. And it may be that a resignation will make it possible to appoint such a man as ex-Mayor Phelan. Then the city government would be in good hands.

Many and serious indeed have been the blunders and sins of organized labor in San Francisco. We are glad to know that in their action concerning wages, since the great fire, the unions have not been wholly unreasonable. At first they publicly agreed to maintain the old rates. But this agreement was soon broken or abrogated. We understand that the advances were made partly because employers bid against each other for labor, thus raising the rates by their own offers, but mainly for the reason that rents were largely increased by landlords and the prices of food supplies sharply raised by merchants. These advances, affecting the cost of living, were made, we are told, before the demands for higher wages, and were the chief cause of those demands.

We have said that their greatest task is now before the prosecutors. How great it may be no one knows who has not read a remarkable statement given to the public by Francis J. Heney on May 31st, a few days after the finding of indictments against Patrick Calhoun and several other wealthy men was announced. There were several thousand words in this earnest address to the public. The prosecutors, Mr. Heney said, were facing the gravest crisis that had arisen since the beginning of their work. Rich friends or business associates of rich men indicted had sought to prevent the prosecution of them. The influence

of the banks upon borrowers and depositors had been exerted for this purpose. Bank managers were saying that the prosecution of such men as Calhoun would destroy the financial credit of the community. "This method has been adopted and is being diligently and systematically used in San Francisco and thruout the State in behalf of the rich men who have been indicted." Banks in New York, he continued, that were subject to the influence of Mr. Calhoun and his associates had brought pressure to bear upon their bank correspondents in the city, in order that, if possible, the prosecution might be prevented. Before the indictments were reported, "bankers and merchants" had "talked to members of the grand jury along these lines."

He argued at length to show why it had been necessary to procure the confessions of the Supervisors and to defer the prosecution of them, explaining that the indictment of guilty rich men was needed to convince the poor man that no one was above the law. A committee of seven had been appointed to co-operate with Rudolph Spreckels and himself. This, he said, had been a part of the scheme of fraud and hypocrisy. It had been "inspired by the same rich men who are now under indictment and by their friends," and the purpose of the project had been to impair "the efficiency of the prosecuting officers." "We want your support," said he in conclusion; "we denounce as lies the charges that we are prosecuting any man or men with malicious or selfish motives or to gain any personal end."

This appeal, made only three weeks ago by a prosecutor of exceptional ability and courage, indicates the nature of the hostile influences against which he may now have to contend. The credit of a city having an assessed valuation of $400,000,000 and a municipal debt of only $5,000,000 ought to be good. If San Francisco's financial credit has been impaired, the impairment is due to the exposed dishonesty of officials and others who are now, we trust, to be brought to justice. The way to establish its credit on the highest level is to punish every guilty man who has been indicted and to prove that no one of them is above the law.

Employers' Liability

President Roosevelt's fertility in suggestions of economic and social reform was unimpaired when he boarded his car for Oyster Bay and the summer vacation. If he really was or is in need of rest, nothing in his public activity gave intimation of the fact.

It was to be expected that his proposal that "workmen should receive a certain, definite and limited compensation for all accidents in industry, irrespective of negligence," would precipitate the usual volume of infallible journalistic judgments, most of them, of course, condemnatory. But Mr. Roosevelt's battery is such a rapid-fire machine that the editorial pages cannot hold open for the criticism of any one volley for more than two or three days at the longest. For the plain, non-journalistic citizen, however, it is sometimes a useful exercise to turn back to one of the President's propositions after the newspapers have forgotten it, and looking at it dispassionately, try to see what reason the strenuous propounder may have had for his conviction.

This particular suggestion on the subject of employers' liability has seemed especially crude and drastic to most of his critics merely because they are not informed upon the results of such economic-legal experiments in some other parts of the world—for example, in England, where the statute in force with good results for nearly ten years past is substantially that which Mr. Roosevelt proposes for American railroads.

As it stands today, our law on this subject is about as absurd, and in its practical working, unjust, as it could well be made. In no class of cases that come before the courts are the parties to a suit more unequally matched. On the one side a laborer, or even a skilled man like a locomotive engineer, to whom the loss of a month's wages means a close approach to poverty, and to whom a very modest lawyer's fee is almost beyond command; on the other side, a corporation to which a check drawn for a thousand dollars or more for an hour's advice is only an item in the day's accounts—such are the plaintiff and the defendant in most of the accident cases. It is true

that not infrequently juries award large damages to a plaintiff whose injuries are clearly shown to have resulted from gross negligence on the part of the defendant. But even in these cases judgment by the trial court very rarely means ultimate payment of the award. It is the rule of the corporations, very seldom departed from, to appeal from court to court, and long before the court of last resort is reached the plaintiff, dropping out of the unequal struggle, accepts whatever payment is offered him in settlement.

Not only by reason of this inequality is the workingman, who faithfully serves mankind by risking his life in a dangerous occupation, placed at a hopeless disadvantage, but also by the very letter of the law his case is made nearly hopeless. Under the statutes of the State of New York, for example, the slightest contributory negligence on the part of an injured employee is a bar to recovery, however gross may have been not only the negligence of the employer, but even his flagrant violation of specific statutes. Thus, for example, in the case of a young girl maimed for life by unprotected machinery which the law expressly says shall be protected, it was held that no recovery could be made because the child was working in a factory under legal age, altho it was shown that the employer had engaged her in full knowledge that he also was violating the law and that he had expressly commanded her to operate the machine in the face of her fear and protest.

To say, as every right-minded man must say, that such a state of affairs is barbarous and a disgrace to our alleged Christian civilization, is to stop far short of the protest that should be made. President Roosevelt deserves the thanks of the entire American people in having raised the question whether a more adequate protection may not be provided.

It may be true, as many employers allege, that an inflexible rule of payment for all injuries, without suit brought for recovery and irrespective of contributory negligence, would so greatly increase the operating expenses of industry and commerce that the prices for all goods and services would have to be raised to the consumers. The President contemplates this possibility, and says: "Let the prices then be raised." In the long run the general welfare would be promoted.

We seriously question, however, whether any appreciable increase of cost would follow the proposed reform. Enormous sums in lawyers' fees would be saved, and the improved machinery and appliances which railroads and manufacturing establishments would be compelled to resort to would probably be a real economy in the end. We still labor in America under the delusion that, whether or not it is ethically right to hold property more sacred than human life, it is economically expedient to make the assumption. The courts do not make it in set words, but far too often their rulings unconsciously or tacitly involve it. It is probable that every commonwealth annually carries a large sum to the loss column of its profit and loss account because of this erroneous judgment.

Mid-June

THE middle of June is the middle of the year; that is it ought to be, but this year it is so only in the calendar. Spots on the sun, or a misguided Gulf current, may account for the cold summer, but there are compensations. It is a splendid opportunity for prophets. Of course nothing less than a new glacial era will satisfy these, while some of them will have to bring the world to an end. As this has been done so often already nobody cares. Among the Jews a false prophet was stoned to death. It has not yet occurred to Anglo-Saxons to put this check on foreseeing. One may have his pick of the prophets, according to his temperament; the Jeremiah sort predominating.

But all this while the trees and bushes, regardless of prophecy, have gone straight forward. Never was foliage finer; never did the fruit trees so throw their souls into blossom. A big apple tree is about the best symbol of human good-will that the world has, and in early June the Northern orchards were ablaze with bloom. A good deal of May is pushed over the line this year, a little belated; but for that reason or for some other the blossoms hang on twice as long

as usual. The Judas tree was full colored for a month and the orchards for two weeks. The bees have the better of it and so do we. It makes poets of us; and unless a man has some poetry in his life he gets little good of it. Even the cowboy and rough-rider literature puts a new face on Nature for those who cannot understand Thoreau and Long and Roberts and Burroughs. But alas for the cities during these ugly months. The excursion boats make few trips and suicides multiply.

Nature, after all, says very different things to different folk, so that going back to Nature is not the same thing to all who try it. The simple life is to some exceedingly complex. Ten volumes make one man's library, but the next needs ten thousand. And the ten volume man gets out of the fields mostly hay—for his cattle. The orchards have only so many barrels of salable apples for him, and he has never noticed the shades of color in apple blossoms. The odor of the lilac bushes is always stifled with the stale odor of tobacco, and the rose is unable to make an atmosphere for either his soul or his body. These people have the advantage during the ill-timed months, for tho they miss something, they do not lose as much as the man with imagination.

The big thing about June is that it is the fullest expression we ever have of life. It comes nearest to being all growth, expansion, ebullience, joy—in other words, all life. One thing supremely notable is the vast number of creatures and things brought into co-operation, working together, if you please, for the glory of God; or if you prefer so to express it, for the help of man. The bees, while gathering honey, pollenize the apples and plums. There would be little fruit without this by-product of honey making. And what a job they have; what millions of blossoms to visit! At first glance the birds seem working only at their own affairs, but they really need us and we need them nor can we get on alone. Then what diversity of results! What would happen if conformity should get control of Nature? The infinite variety of outlines in the trees and groves reduced to formality; foliage and flowers toned into one fashion; birds all singing just one song, and in the midst of it all men with exactly the same emotions, hopes, purposes, methods and joys. Think of only one game in all the world; croquet, or some such inanity as dominoes. This, after all, is what the world has fought for and prayed for. Conventionalism and conformity have been the ideal of the millions of brakemen (and brakewomen), but the little leaves of June have resisted this tendency successfully.

How can a man be without religion in this sort of world? It seems barely possible during January; but at least twice a year there ought to be a big spontaneity of emotion, looking outward and upward for some One to love; in May and June, when everything is full of beauty and sweetness, when the violets and the roses and all the huge trees that fill the lawns and the orchards are breathing fragrance; and once more in September and October, when the harvests are being gathered in, when the apples cover the ground and the corn lies in golden piles about the fields. The spirit of beauty is abroad in June, the ugly has no place. The valleys are alive with gentle emotions; the hills kiss their hands to each other. Whence came those religions that breathe vengeance? They must have been born in deserts, and in either oppressive cold or oppressive heat; they are the children of terror. Let us have the religion of June. Indeed we do have it if we walk with Jesus in the wheat fields, discuss parables of everyday life, or the lilies that toil not nor spin. Some time we shall find the soul of that religion that was born in the spirit of good-will and everlasting fellowship.

What an insignificant thing is a flower. How can human happiness hang on a fragile bunch of petals and stamens, that blushes and dies? But poetry is the rhyming of Nature, the making all things to sing together. Then science goes farther, for it teaches universal interdependence and counsels infinite respect and tenderness. It shows us all things moving forward together or retrograding in company. If your fields run to thistles so does your soul. A man is never so well photographed as on his farm—that is a complete picture of himself. Then poetry and science strike

hands in teaching us the purpose and the spirit, the soul in all things; and before we are aware of our drift we find the Lord's Prayer and the Parables written between our mathematical axioms and our philosophical categories. The Golden Rule and the Rule of Three are not far apart. For is it not June that repeats, annually and fervidly: There is One, over all, in all, thru all; in whom we live and move and have our being. The blossom of the rose is natural piety. The lily comes up in faith and hope and love. Every day is brimful of promise.

The strawberries are first to fulfil, and the cherries follow close after. But everything says, Believe in something good; in Him who inspires all things. Everything is forward-looking. Who told the farmer that he could put seed into the ground and by and by could get it back again fourfold? His faith has become a sort of instinct, an unconscious trust. He is complicated with an intricacy of purpose and wit and good-will; and instinctively knows it. Science and art and religion are one. To work is to worship; *"Laborare est orare."*

Gen. Robert E. Lee, Jr., as a Historian

At the meeting of the Confederate Veterans at Richmond, General Stephen D. Lee was re-elected Commander-in-Chief, and General Robert E. Lee, Jr., made a speech which, we are told, "thrilled the convention." We are pleased that it made no defense for slavery or secession, but we are interested in some historical statements made by the speaker. He said:

"Her greatest men [of the South] always maintained slavery to be the most dangerous element in the country."

That is good to hear, but it follows that Jefferson Davis and John C. Calhoun were not in the list of her "greatest men." Calhoun, when Secretary of State, in a despatch to the British Minister, April 27th, 1844, declared slavery to be a political institution "essential to the peace, safety and prosperity of those States of the Union in which it exists." That language seems strange now, and is not repeated.

General Lee continues:

"Virginia in October, 1778, and Georgia in 1798 passed acts prohibiting the importation of slaves. Thus, to the everlasting credit of the South, upon whose devoted head the vials of holy wrath have been so unjustly and brutally poured out for propagating, nourishing and harboring slavery, she leads the world in an earnest attempt to prevent the very thing of which she is accused."

Virginia and Georgia past such acts and Maryland also. Massachusetts and other States past such acts some years earlier. But General Lee says:

"Altho the South had at one time no inconsiderable career of maritime adventure, no ship or shipmaster of hers has ever in a single case been implicated in the illicit African slave trade."

Slavery was planted in South Carolina by Governor Sir John Yeamans, who brought his slaves from the Barbadoes, to be sure, not from Africa. But slave ships sailed from Savannah for the coast of Africa, and Georgia became a slave State against the will of James Oglethorpe, who led the first settlers.

As to secession General Lee says:

"Secession was not preached for the first time in the South. It was threatened in the North four times before South Carolina seceded. First, from Col. Timothy Pickering, of Massachusetts, opposing the acquisition of Louisiana; second, from Josiah Quincy, of Massachusetts, over the proposed admission of Louisiana as a State; third, from the Hartford Convention, in which five States were represented, over the dissatisfaction occasioned by the war with Great Britain, and fourth, from the Legislature of Massachusetts, because it was proposed to annex Texas to the Federal Union."

These are extraordinary assertions, and should not be allowed to pass into popular history unquestioned or uncontradicted. It is unfortunate that such declarations should be given wide currency. It is true that Colonel Timothy Pickering opposed the acquisition of Louisiana, altho we find no evidence that he favored or threatened secession. The extreme of Mr. Quincy's secession utterance was made in Congress in 1811, when he said that if the bill for the admission of Louisiana should pass "the bonds of this Union are virtually dissolved, that the States which compose it are free from their moral obligations; and that, as it will be the right of all, so it will be the duty of some, to prepare definitely for a separation, amicably if they can, violent-

ly if they must." But we do not find that when Louisiana was admitted he then actually urged separation.

As to the Hartford Convention there is no doubt that its members were charged with favoring secession, but this was mainly calumny. Massachusetts and Rhode Island and Connecticut sent delegates, but with the distinct provision that whatever was done must be "not repugnant to their obligation as members of the Union." That forbade secession. The conclusions were in the form of recommendations for amendments to the Constitution, such as that representation and taxation should be based on the population of free persons, and that a two-thirds vote should be necessary to admit a State or to declare war, and that no President should be chosen for two successive terms from the same State. There was no secession there. Amendment precludes secession.

Finally General Lee declares that the Legislature of Massachusetts took action in favor of secession because of the proposed action to annex Texas. This statement is a figment of a disordered imagination. No such action was taken, not even in the public meetings of protest presided over by Charles Francis Adams and Henry Wilson. Indeed it was elsewhere that secession was proposed. The cry was: "Texas or Disunion!" A meeting in the Barnstable District of South Carolina called for "annexing Texas to the Union, if the Union will accept it; or, if the Union will not accept it, of annexing Texas to the Southern States." At the Williamsburg District of the same State a meeting declared that "it was better to be out of the Union with Texas than in it without her"; and in Beaufort another meeting announced that they would dissolve the Union "sooner than abandon Texas." Senator Benton, of Missouri, believed that under the pretext of getting Texas into the Union, the scheme was to get the South out of the Union.

We offer these corrections, not because of General Lee's authority as a historian, but because his address has been published all over the South, and will be assumed there to tell the accepted truth. But it is not the truth, and it is just such misstatements as these which mislead public judgment, and even foster sectional prejudice and distrust.

Our Battleship Show

THE business of the Atlantic fleet, now including sixteen battleships, is during the summer months to practise battle tactics. Battle tactics are simply rehearsals in which the conditions of actual engagements are reproduced as nearly as possible; squadrons or fleets acting against one another or against targets disposed in some special way. It is just as idle to imagine that a company of actors could satisfactorily perform a play without rehearsals as to think that a group of battleships could efficiently act together without them. In this way not only are possible evolutions tried out, but the capacities of the vessels themselves under crucial conditions are determined; and as every one aboard them is, or ought to be, compelled to take the exact station he would assume in battle and work in that environment, such practise is exceedingly valuable in determining whether or not obstacles to his best endeavors exist.

This is especially true with regard to admirals and captains. Just where an admiral is to go during an action is today a much discussed question in the navy; and another one of equal importance is whether or not captains should be shut up in conning towers, where their field of vision is very limited, and if not how they are to be protected. Then there are many serious questions relative to conveying orders or information from ship to ship, for it is recognized that wireless telegraphy cannot be used in battle, and these involve the trying out of signal systems or of practising maneuvers without any signals at all. All of these matters are of great moment, and their settlement is entirely apart from attaining proficiency in hitting targets.

There has not been any such team work—certainly none worthy of the name—and it is high time the fleet got at it and stopped drifting around to summer watering places or making a show of itself at Jamestown. Nobody disputes that the people ought to be given chances to see their ships, and that it is a good

thing, now and then, to send them into the Hudson River or to other places where large numbers of their owners can inspect them; but not at the expense of their efficiency. In that Jamestown fleet there are half a dozen battleships which are not even "shaken down"—that is, their new crews neither know their vessels nor their places on them so as to be able to handle them, even during ordinary cruising, with certainty and skill. To imagine that they are now ready for action is absurd; and a war vessel that is not so ready, instantly and at any moment, and whether in peace-time or war-time, is of little use as a national safeguard or peace promoter. There has been plenty of criticism directed to the contribution already made in money by the nation to the Jamestown Exhibition, but the amount given will look small if the battleships are to be kept there for any length of time. The expense of them is about $44,000 a day, not counting loss by deterioration, and their lifetime is very short. This is easily enough borne if coupled with the knowledge that they are being kept up to the highest working mark; but when they are not and it is all devoted solely to furnishing another attraction to a privately owned show, it looks altogether too much to take from the taxpayers' pockets. Besides, six officers and seven seamen of the navy have so far lost their lives at Jamestown —and that is more than the Spanish war cost us.

The Japanese Flurry

We do not believe that there is the slightest chance of war with Japan, and it is reckless madness to make a noise about it. But no thanks to San Francisco. That city needs a change of heart, and there is evidence that it is experiencing a change of heart. Its Mayor is in prison and a new Mayor will act in his place. We trust that the new control will yield less to noisy and blatant demagogs, and that decent treatment will be accorded to yellow men as well as white.

The United States, as a nation, has good will toward Japan and the Japanese. Equally, Japan has good will toward our country. The feeling in San Francisco is not general. There may be in any country sections that do not represent the people as a whole. San Francisco is peculiar. It has been ruled by a class of people that represent not its best, but its worst element. Now the city will try again to put its best to the front.

The occasion of the present difficulty is not of the sort that has any serious import. Such cases have occurred not a few times in the past and no war threatened. We had one such case in New Orleans, when not merely was a shop sacked, but when several Italians were killed, and our country paid the damages, for it could not overstep State authority and punish the guilty. The Japanese themselves had a bad mob in Tokio on the announcement of the Peace of Portsmouth, and destroyed American property, and we never thought of it as an occasion for irritation and war. We knew it did not represent the Japanese Government or the Japanese people as a whole, nor even those men who composed the mob when in their sober senses. The occasion was peculiar, and the feelings of the populace were stirred by their disappointment. They were in a passion because, under the earnest advice of President Roosevelt, their negotiators had yielded and received no tribute of money from Russia. But there was also occasion for the outbreak which led to the destruction of the Japanese shop in San Francisco. The feeling was not against the Japanese as such, but against them as giving shelter and provision to white scabs. It happened to be Japanese that suffered incidentally to most miserable and shocking conditions in a great labor war. To be sure, it made the case no easier that the shop belonged to a Japanese, but it would be ridiculous to make this a *casus belli*, and that the responsible Japanese statesmen know full well.

And yet this is otherwise a matter for serious concern, for it is such incidents as this and as the public school difficulty which create that public feeling which might lead in the end to war. The Japanese are as proud a people as are we, possibly as arrogant. When we use the latter word we refer, not to the attitude of our Government, but to that of individuals. We have a vast number of citi-

zens who imagine that those of another race are essentially so inferior that we can scarcely do injustice to them, so long as we merely wipe our feet on them. Such people make us enemies in Cuba, in the Philippines, in China and in Japan. They are the men who are responsible for the Chinese boycott against American goods, and it is just such Britishers who are responsible for the growing ill will and the restiveness in India under the English control. Englishmen are now seriously concerned as to what the outcome will be in India, and these conceited Americans are preparing the way for another outbreak in the Philippines. In order to be loved we must ourselves first love. When California declares that she does not love and does not want the Chinese or the Japanese, it arouses reciprocal hatred in those countries. The men who assert racial inferiority for the Japanese are doing their best to create war, and such a war would be one of the worst which the world has ever seen, and the result would be very doubtful. At present Japan has far the larger and better trained army and equally the larger and heavier navy, and could destroy ours piecemeal before our entire fleet could be concentrated, and Hawaii and San Francisco would suffer most in a war of the two Powers.

But, as we have said, a war is preposterous. We have so little fear of it that we have not yet taken pains to protect Honolulu with any sort of a fortress. A late visitor regards this as a most amazing case of reckless confidence and bravado. It is not that; we are anticipating by a little while the condition of universal peace which the Conference of The Hague is anxious to hasten. The time will come when war will be inconceivable.

Send Us Your Animal Observations

It is no insignificant question that has been raised by Mr. Burroughs, Mr. Long and the other writers on animal nature. It is something more than a quarrel or a joke. The question is whether animals act purely from inherited instinct, or whether they can use their reason when unusual circumstances require it. This is a matter partly for definition, and much more for facts of observation. And such facts well attested are to be desired. We should be pleased if our readers would send us, in brief compass, unusual and peculiar examples of such acts of reason. They should be only such as the writer has himself seen and would be willing to make affidavit for. We want no fakes, only genuine facts, related in not more than four or five hundred words. And we want them not merely because they will be interesting, but also because they will have a real scientific and psychologic value. It will be the duty of the student of the mind to analyze and co-ordinate them and decide how far they accredit the claim which the popular nature writers have made that the animal mind is only an inferior human mind.

Is It Tainted Money?

The Hon. John Bigelow, veteran diplomatist and scholar, has published a booklet in which he argues that the peace prize given to President Roosevelt in honor of his services in securing peace between Russia and Japan was wrongly given, and that the peace then created against the wish of both parties was a great wrong to the world and particularly a disaster to Russia. If the war could have continued, he says, and the Russian army have been finally beaten, the people would have overthrown the Government. The blood shed was very likely more than would have been expended by the continuance of the war. For this reason the Nobel Prize given to Mr. Roosevelt would be in a way tainted money. We are not convinced by this argument. To end the war was a humanitarian object in itself, and it is by no means clear that a prolongation of the war would have destroyed the power of the Government to repress revolution. As it is, the advance is very great already, even with the Duma dissolved. The Russian army was held back, and the Czar did not dare to bring it home for a long time. Meanwhile the revolution was quelled, and the Government tried to pacify the people by reforms and a show of self-government. It is not easy always to say what would have happened if things had been done otherwise. For one thing Japan might have been utterly exhausted in the attempt to complete its

conquest. It must be remembered that the Nobel Prize was not for improvement in Russia, but for services in the direction of peace.

Senator Morgan

The two Nestors of the Senate have been the two Senators from Alabama, Morgan and Pettus, both long past eighty years. Of these Senator Morgan was the leader—indeed, one of the leaders of the Senate who was always to be considered, because he was a conscientious man, who obeyed no party whip but acted according to his own judgment, and who acted with the utmost vigor. He had the endurance of a young man. If a bill of importance was before the Senate to which he objected he did not hesitate to kill it, if necessary, by wearing out the patience and time of the Senate by an interminable speech, and he had the record for long speeches. And his speeches were remarkable for their clearness and fullness of fact, for his memory of details was phenomenal. Of course, he was a Democrat, but he had the distinction of supporting measures proposed by Republicans when he thought they were wise, and he did not fear to vote against nearly all of his party. Few Senators will be more missed. His successor will be Congressman Bankhead, who was defeated at the last election by Hobson, the naval hero, but who has been chosen by the people of the State, at a primary election, to fill the first vacancy.

Why Orchard Confesses

We do not care to discuss the evidence in the Haywood case before the trial ends, extraordinary as that evidence is, and unsuccessful as the attempt has been to discredit it on cross-examination. Of course, the public must wait, before acting as a great popular jury, until the defense has presented its case also. It is very unfortunate that so many had formed their conclusions on both sides, not on the evidence known to them, but purely from antecedent prejudice, some pre-convinced that whatever organized labor has done must be wrong, and others that it can do only right. But of one point we may fairly speak, and that is, the reason Orchard gave for making a full confession. It was that in prison he had come to have a religious experience, had seen the wickedness of his past life, and had resolved to live a right life hereafter, trusting in the mercy of God. Whether in this he was telling the truth, or the truth in any of his testimony, we do not need now to say; only this, that every one allows that this was an adequate explanation, if true, and no one sneers at it, except the counsel for the defense, who sneered professionally thru all his cross-examination. People everywhere believe in religion, in the possible conversion even of the worst, and few can be worse than Orchard, who has been as murderous a man as was Saul of Tarsus.

The Horse and the Man

"And where will you find such men as in Scotland and such horses as in England?" was the comment of the Scotchman on Dr. Johnson's definition of the word *oats* as a grain fed to horses in England and to men in Scotland. It would seem that in Ireland it is his horse that gives glory to the man, if we can judge from the high honors there paid to Mr. Croker, the whilom Tammany boss, on the occasion of his capturing the Derby. His horse was trained at Mr. Croker's Irish stables; and on the return of the horse and the man bonfires were lighted, crowds met them, and the Dublin corporation gave the freedom of Dublin to the winner—that is, to the owner, and not to the horse. The city of Aix did better for the horse when the good news came:

"And no voice but was praising this Roland of mine
As I poured down his throat the last measure of wine,
Which the burgesses voted, by common consent,
Was no more than his due who brought good news from Ghent."

The decision of the New York Court of Appeals upon the law limiting the hours of labor of women in factories is based on very modern views of women's rights. Women are not minors, says the decision. If men have the right to work what hours they please, then women should have the same right. It is a decision in favor of women's rights as against women's interests, and—we believe—the interests of the human race.

Insurance

Hazards of July the Fourth

THE celebration of July 4th, or "Independence Day," is once more close at hand. The day we celebrate will again this year, doubtless, be ushered in according to long-established precedent by the tooting of horns, the ringing of bells, the discharge of cannon, the firing of guns and pistols, the sending skyward of rockets, the ascension of hot air balloons, the burning of red lights, roman candles, pinwheels, chasers and other pyrotechnical devices, as well as by the explosion of various kinds of mines, torpedoes, cannon and other firecrackers. The young American loves noise, and accordingly revels in everything that produces it. He is in his element on the Fourth of July. Toying as he does with the toy pistol and even more dangerous firearms, his patriotism is inspired or reinspired according to his age. He is thus also, it is true, often brought face to face with tetanus. Other casualties, fatal and otherwise, that overtake individual American youth because of the conventional celebration of the day thruout the United States are numbered by hundreds, if not by thousands. The loss of eyes, hands, feet and other members of those who celebrate is sad enough, but in addition to personal injuries suffered, the property loss, because of the Fourth of July hazard, has become a serious annual menace. When the life and property loss arising directly from our present method of the annual celebration of this great country's Declaration of Independence costs the country in sum total more in lives and property than the population and property valuation of the thirteen original States, we may well doubt the safeness and sanity of the old-time celebration. The present seems more than ever a fitting time to call a halt and to follow in the footsteps of Iowa, Wisconsin and Connecticut and interdict the sale and use of giant and other firecrackers, the firing of revolvers, toy guns and the like on July 4th. Mayor Busse, of Chicago, proposes to insure a quiet Fourth if it is possible to do so, and to this end he has already issued a proclamation relative to the enforcement of existing ordinances regarding the sale of fireworks, and has secured the co-operation of the municipal court and the police department in thus preparing for Tetanus Day. "This early warning," to use the Mayor's own words, "plays fair with everybody. The person who is arrested now for violating the ordinances has only himself to blame." The young, it has been well said, are the hope of the country, and it is not meet to take away an innocent heritage from our boys and girls, but if the young people of today are to be "desirable citizens" in the best sense they must be taught not to disregard the rights of others. They must learn that the sick and the nervous, to whom rest and quiet are often as priceless jewels, have certain rights upon which no boy and no girl has any right to trespass. We are frequently loud in our boasts regarding our progress and civilization, but when, for the safe and sane method of celebrating a grand holiday, we substitute the crude methods of savages, who express pleasurable delight only in their wild beatings of tom-toms and noise discordance, we sink rather than rise in the scale. American youth may learn much by taking thought of others and in self-denial when basilar instincts struggle for supremacy during the process of reviving the memories of '76. If they would hark back to a careful study of what the day signifies in its highest and best sense as an anniversary, the academic effect would be far more tremendous than the mere fusilade of firecrackers, the noise of the explosion of which has been greatly amplified, but at the same time made more obnoxious to a sensitive ear, by means of setting them off in an empty barrel. It is not expected that our youth will concur in the thoughts here set forth, but with advancing years they will in all likelihood agree with us in thinking that a new and modified celebration of the glorious Fourth ought to come and will come. Both life and fire insurance companies will surely and immediately concur in so thinking.

Financial

The Wheat Crop

ACCORDING to the Government's report for June 1, issued on the 10th, the indications are that the wheat crop will fall 100,000,000 bushels below last year's, which was 735,000,000 bushels. On the 1st, the condition of the growing plants was much below the average for the last ten years. There was also a decrease of acreage, about 1,500,000 acres for winter wheat, and 1,242,000 for spring. The harvest loss, however, is to be in winter wheat (probably more than 110,000,000 bushels), for a larger spring yield than last year's is indicated. Europe's crop will also be a short one, estimates of the probable reduction ranging from 120,000,000 to 200,000,000 bushels. Therefore, there will be a fair demand abroad for our surplus, but the chances are that we shall not have much to sell. The actual extent of the injury suffered by our wheat has been exaggerated, and speculators took advantage of the exaggeration. Up to May 27th the price for July delivery had risen at Chicago 30 cents, to $1.03½. This was the top. More favorable advices and speculative sales caused a decline after that date. The fall from May 27th to June 15th was 15½ cents, and 9½ cents of this total followed the publication of the Government's report. The yield of oats promises to exceed even the large crop (965,000,000 bushels) of last year.

The Removal of Mr. Fish

THERE was much public interest in the meeting of the Illinois Central's board of directors on November 7th last, when Mr. Stuyvesant Fish was removed from the presidency and Mr. Harahan elected in his place. In the course of some remarks about this meeting we said, in THE INDEPENDENT of November 15th, that the motions in opposition to Mr. Fish were "made by a director who is also a Mutual Life trustee [meaning Mr. Auchincloss], and who was one of the two members of the [Mutual Life] investigating committee who opposed Mr. Fish's desire for a searching inquiry in February last," and were "seconded by Mr. Peabody, who is an Illinois Central director as well as the president of the Mutual Life." This was in accord with the somewhat elaborate reports of the meeting published in the daily press of New York and other cities, which were not afterward, so far as we know, corrected or publicly questioned by the parties interested. We are now informed, however, that the motion which resulted in the election of Mr. Harahan was made by Mr. Auchincloss and seconded, not by Mr. Peabody, but by Mr. Goelet.

Heavy Gross Earnings

THERE was a large increase of railway gross earnings, according to the returns obtained by *Bradstreet's,* in the months of April and May. April's increase was 16 per cent.; May's was 15.1 per cent., or $10,829,677 in a total of $82,728,103. These large gains followed much smaller ones in the first three months of the year, when the rates of increase were as follows: January, 2.4 per cent.; February, 2; March, 8. If we take full calendar years, it appears that the gain was 7 per cent. in 1905 and 12.7 per cent. in 1906. For the eleven months ending with May it was a little more than 9 per cent. May's increase was widely distributed, but the Northwestern roads, with 25.8 per cent., were at the top of the list. Traffic congestion has recently been relieved, and there has been a more abundant supply of cars.

....On the 13th inst., transactions at the New York Stock Exchange amounted to only 189,491 shares, the lightest day's business in two years.

....The Equitable Trust Company, of this city, is to be merged with the Mercantile Trust Company. The latter name will be retained, and the president will be Alvin W. Krech, now president of the Equitable. He will succeed Henry C. Deming, who recently resigned on account of ill health.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

National Politics

Secretary Taft returned to Washington on the 22d from a tour of two weeks in the Middle West. In Omaha he was asked to respond to a toast in which he was named as the next President. Explaining that he could not speak to such a toast, he added: "If the duty comes, I shall not decline it." Mr. Bryan had expressed a wish that the Secretary, while in Kansas, would set forth his views upon the railroad question and other prominent issues of the day. Replying, the Secretary said at Ottawa, on the 20th:

"I beg to remind the distinguished Nebraskan that more than six months ago I had the honor, before a large number of audiences of American citizens, to discuss the Trusts, the regulation of the railroads, and the revision of the tariff, and that this discussion proceeded, as it should proceed from a member of the Administration, from the standpoint of those who are charged with the responsibility of carrying out public policies, and not of making declaratory statements for use in platforms only; that the result of the campaign in which these views were announced on behalf of the Administration, not only by me, but by other representatives of the Republican party, was that a Republican Congress was returned to carry out these policies on the basis of those announcements, and that when the appropriate time shall come to renew the discussion I shall be glad to take my humble part in setting forth those views, which I have not changed up to date."

The Republicans of Kentucky, in their convention, adopted resolutions favoring the nomination for the Presidency, of a candidate in full accord with the President's policies. Some think that their failure to name Secretary Taft was due to the opposition of negroes, who are said to dislike him on account of the dismissal of the negro soldiers at Brownsville. A few days ago the Senate committee's inquiry as to the Brownsville affair was closed. Senator Foraker then published his analysis of the evidence. The testimony had utterly failed to show, he said, that the negro soldiers had had anything to do with the disturbance. Upon the same subject he spoke at length, on the 20th, at the commencement exercises of Wilberforce University, Xenia, Ohio, where thousands of negroes were in his audience. He declared that no soldiers of the dismissed battalion had been connected with the raid. The President and Secretary Taft had acted in good faith, but he believed they had been misled. He had taken an interest in the case because he remembered the attack of white regulars upon the people of Athens, Ohio. Secretary Taft had then said that the enlisted man was a ward of the Government, and that it was the Government's duty to see that he was tried according to law. "The reason that prompted him," said the Senator, "prompted me. I thought that what a white soldier was entitled to at Athens, Ohio, a negro soldier was entitled to at Brownsville, Tex."

"If for what I have done in this behalf I am to be eliminated from public life, as has been proclaimed, then let it be known that I shall at least carry with me into private life the consoling satisfaction of feeling and knowing that I have been rebuked for an action that I shall never regret but always esteem as creditable to my heart as a man and to my sense of justice and duty as a public official."

——Governor Cummins, of Iowa, predicts the nomination of Mr. Roosevelt, who, he says, must heed the call of the people. Ex-Judge Selden P. Spencer, of St. Louis, professes to have been informed by friends of the President in

Washington that the latter has decided that he will not decline a nomination if it shall be tendered unanimously. Thomas W. Lawson is confident that Mr. Roosevelt will be the next President. "If the Republicans do not nominate him, the Democrats will." Ex-Senator Chandler supports the President's policies, but thinks Senator La Follette should be chosen. Henry Watterson remarks that the trend is toward Governor Hughes, whom he regards as the most available man on the Republican side.

Mr. Bryan on Democrats

Accepting an invitation from the New York *World*, Mr. Bryan has undertaken to answer the question "What is a Democrat?" From the party standpoint, he says, "a Democrat is one who considers himself a member of the Democratic organization, who works with that organization, and who expects to vote the Democratic ticket," altho by taking part in the organization he does not bind himself morally or politically to indorse any platform that may be adopted, or to support any candidate who may be selected. Turning to the broader aspect of the question, he says: "I will define a Democrat as one who believes in the rule of the people." Jefferson, he continues, "used the word democrat to distinguish those who have confidence in the people, and the word aristocrat to describe those who fear and distrust the people." The two parties represented by these terms are to be found in every country. From the earliest time we have had them here, but the doctrines of Jefferson, as opposed to those of Hamilton, were never stronger in the United States than they are today. Altho our Senate is more Hamiltonian than the House in its method of election, there is a constant growth of sentiment in favor of the popular election of Senators, and now a man who opposes such election can hardly claim to be democratic in his ideas. "There is, however," Mr. Bryan says, "a question upon which there is at present a division of opinion among Democrats, namely, the initiative and the referendum, or, as the system is sometimes called, direct legislation":

"This reform will not abolish representatives, but it will enable the voters to coerce the representatives into obedience to the popular will. As the subject is better understood, its harmony with democracy will become more and more apparent, and I have no doubt that the time will come when the people will understand the subject of direct legislation as well as they do the popular election of Senators, and then it will be as difficult for a Democrat to oppose the former as it is now to oppose the latter. While the application of the doctrine of direct legislation was naturally made to the city first and to the State afterward, the principle applies just as well to the National Government as to the governments covering smaller areas. The question is, Shall the people rule? And that question is as vital in the government of the nation as in the government of a State, a county, or a city. Of course, in the nation the equal position of the States must be respected, and it is absurd to talk of the small States being overwhelmed by a popular vote, for those who favor the application of the initiative and referendum to national questions favor it with the understanding that the people of a majority of the States, as well as a majority of all the people, must concur."

Local self-government, Mr. Bryan says, is a fundamental Democratic doctrine. The State should have control of State affairs, and the Federal Government should be supreme in its sphere. One who is really aristocratic in sentiment cannot become a democrat until he has a change of heart. It is possible to show a real democrat that he has failed to apply democratic principles to a particular question:

"In 1896 a number of persons left our party who called themselves Democrats. Some of them were aristocratic in sentiment, and their departure was perfectly natural. They have not come back, and they will not come back so long as the Democratic party is democratic, but a far greater number of those who left us in 1896 left from misunderstanding. Most of these have come back, and the rest will come back. A majority of the Republicans are really democratic in their fundamental ideas, and to these we can appeal if the Democratic party convinces them that it can be trusted to carry out democratic principles."

In this statement Mr. Bryan says nothing about Government ownership of railroads.

Pursuit of Land Thieves

Sentence was pronounced, at Omaha, on the 20th, in the cases of several prominent men recently convicted of conspiracy to defraud the Government of public lands. Thomas M. Huntington and Ami Todd, bankers and ranch owners, were sent to jail for three months and fined $1,000 each. Frederick Hoyt was fined

$1,000. These men had been associated with Bartlett Richards, William G. Comstock (both millionaires), Aquilla Triplett and C. C. Jameson, who were convicted some months ago, receiving sentences of from six months to two years in jail. The indictments related to nearly 1,000,000 acres of land controlled by the Nebraska Land and Feeding Company. Old soldiers and the widows of soldiers were induced by the conspirators to file claims upon the lands. They visited their claims once or twice a year and received small sums for their services. Among the results of the Government's investigation of these cases was the removal of a Federal District Attorney and a Federal Marshal. About forty suits remain to be tried. The conspirators realized very large pecuniary profits. ——In Idaho, last week, several prominent men engaged in similar transactions were convicted. W. J. Kettenbach, president of the Lewiston National Bank, and G. H. Kester, cashier of the same institution, were sent to jail for eight months and fined $1,000 each. C. W. Robnett's sentence was for eight months. William Dwyer, who procured the services of fraudulent claimants for the bankers, was sent to the penitentiary for eighteen months, in addition to a jail term of eight months.——As a result of an inquiry by the Government, Frank W. Mondell, member of the House of Representatives from Wyoming, and a prominent member of the Public Lands Committee, has formally relinquished his claim to a homestead tract of 160 acres, near Newcastle, in his State. It was alleged that his affidavit as to residence on the tract was untrue. Mr. Mondell in committee vigorously and successfully opposed the Government's request for a large appropriation, to be used in examining evidence as to land claim proofs. In the Land Convention at Denver, on the 19th inst., he spoke at length against President Roosevelt's land policy, saying that the latter's project for control of the pasture lands of the public domain was "the most tremendous and sweeping grant of arbitrary power and authority ever proposed to be given in time of peace to an executive officer." ——The fruit of the Government's inquiry as to land frauds in Colorado appeared on the 22d in more than sixty indictments returned by a Federal grand jury at Denver. Rich coal and timber lands are involved. At this writing the names of the persons indicted have not been made known, but it is understood that among the accused are wealthy men in Wisconsin and Missouri, as well as others in Colorado, Utah, Wyoming, New Mexico and Nevada.——The Land Convention in Denver appears to have been dominated by Colorado and Wyoming interests. At the beginning the official list showed 396 delegates from Colorado, 145 from Wyoming and about 100 from other States. Senator Carter was the temporary chairman. The Government was represented by Secretary Garfield, Forester Pinchot and Land Commissioner Ballinger. As had been expected, the prevailing sentiment was hostile to the policy of the President and the Interior Department. The resolutions adopted are characterized as in accord with this sentiment. At this writing they have not been telegraphed to the Eastern press.

Combination in Ocean Traffic

Upon the complaint of the agents, in Philadelphia, of the Cosmopolitan Shipping Company, which has three lines of steamships plying between that city and Europe (Rotterdam, Leith and Copenhagen), an inquiry of some importance is to be made by the Government concerning the Hamburg-American Packet Company and other companies said to be in combination with it. Asking for an enforcement of the Anti-Trust law, the complainants allege that the Hamburg-American, by means of combination, rebate contracts and agreements with railroads, unlawfully controls nearly all the trade between this country and German, Dutch and Baltic ports; that it subjects American and European shippers to illegal coercion by means of contracts involving rebates conditioned upon the use of its ships exclusively; that it maintains a pool in New York with the North German Lloyd, Wilson and Scandinavian-American companies, allotting percentages of traffic; that it dictates to American exporters the choice of ports of departure, and extends the influence of its combination methods to interior cities of the United States by means of unjust traffic agreements with the trunk rail-

ways. In these ways, it is charged, the company is guilty of unlawful restraint of trade. The company represented by the complaining agents is said to be owned by Mr. Hecksher, of Copenhagen, and to be suffering by reason of the alleged combination's hostility. Rebates are granted, it is charged, to the Hamburg-American by the State-owned railways of Germany. In reply, representatives of the companies thus attacked make a general denial, the New York manager of the Hamburg-American saying that the charges are absurd. Some persons express the opinion that, even if the assertions of the complaint are true, our Government has no jurisdiction, except with respect to the traffic agreements with railways in this country.——Some months ago, Messrs. Klaw and Erlanger and other persons associated with them in what is called the Theater Trust were indicted in New York for conspiracy in restraint of trade, against a law of the State. On the 19th, Judge Rosalsky, in the Court of General Sessions, dismissed the indictments, saying that the theatrical agents who complained had not been prevented from doing business; that plays and entertainments of the stage were not articles or commodities of common use; that the business of leasing and controlling theaters and producing plays in them was not trade, and that therefore the defendants had not committed acts injurious to trade or commerce.——It is asserted that, in addition to the forthcoming suits recently mentioned, the Government will soon proceed against the American Tobacco Company, commonly called the Tobacco Trust.——In many complaints the Department of Justice has been urged to sue the manufacturers of sewing thread, owing to the recent advance of about 20 per cent. in price. The controlling company says that the increase is due to the higher cost of cotton.

Labor Controversies

Having failed to obtain from the Western Union board any response to their demands, the telegraphers, who had been preparing for a strike, sought the good offices of President Roosevelt, who referred their appeals to Charles P. Neill, Commissioner of Labor. On the 19th, the officers of the telegraphers' union issued an ultimatum, promising a strike if the Western Union and Postal companies should not grant their demands within ten days. These demands were for an eight-hour day, the abolition of the sliding scale, no discrimination against union men, and full payment of the increase of 10 per cent. granted in March. It was alleged that this increase had been paid to only about half the employees. Mr. Neill came to New York. Owing to his labors as an intermediary, an adjustment of differences was speedily reached, and on the 20th an agreement was announced. The Western Union's position was defined in a long letter to Mr. Neill from President Clowry, who said that if any employee had not received the increase it would be paid at once; that the sliding scale would not be adopted; that there had not been and would not be any discrimination against members of the union, and that the company was willing to submit to arbitration the complaint of any employee. This was regarded as satisfactory by the employees, who waived their demand for an eight-hour day. But on the 21st the employees of both companies at San Francisco and Oakland, who had demanded a wage increase of 25 per cent., went on strike with the approval of the president of the union, who had accepted settlement in New York. Employees in some other places joined them, and at the beginning of the present week telegraph service on the Pacific Coast was almost wholly discontinued.——There were pending against the City of New York until a few days ago 5,565 suits brought by employees who claimed additional pay under the law requiring municipalities to pay the prevailing rates of wages. These suits, involving nearly $10,000,000, have been settled for $1,100,000, the city also agreeing that the rates in other boroughs shall be raised to the level of those in the Borough of Manhattan.——The wages of railroad freight handlers in Chicago were increased last week, and an increase of 10 per cent. to the freight clerks of the St. Paul and Northwestern roads will be paid after July 1.

Central America Peace and quiet prevail in Costa Rica, which does not appear to have been affected by intrigues for a consolidation of the Central American republics. It is said in Washington that President Zelaya has been warned by our Government that he must not attempt to involve Costa Rica in his projects, because that country adjoins Panama. The Government of Salvador says it is admitted by prisoners captured near Acajutla at the time of the recent raid that the expedition against that port was organized and equipped at the capital of Nicaragua. Conflicting reports concerning Guatemala have been published. Dispatches from the Guatemalan capital say that Cabrera is fortifying his ports and the Honduran frontier, in expectation of an attack from Zelaya. From Mexico comes a story that Cabrera has bought a German steamship, now at San José, in which he intends to leave the country for Hamburg, in company with General Lima and Colonel Onefre Bone (accused of causing the assassination of General Barillas), who are said to have purchased large estates near that German port. It is also said that Cabrera has instituted proceedings for the confiscation of the property, about $15,000,000, of the ten Guatemalans now under sentence of death for attempting to assassinate him.

Cuba The cigar makers on strike were advised, on the 21st, by the Mayor of Havana, to accept arbitration, which was offered by the manufacturers. They declined to do so. This strike, which began in the Trust factories in February, and on account of which the independent factories were closed a few weeks later, has very seriously affected a leading Cuban industry. In opposing the demand for a wage increase of about 10 per cent., the manufacturers assert that the cost of the raw material is higher by from 25 to 50 per cent. than it was a year ago, and has doubled since three years ago. This advance is said to be due to higher wages for farm labor and to short crops.——Representative Govin, editor of one of the Havana papers, has sent to Secretary Taft a protest against the purchase of the church property which the Government has occupied for six years, urging that the Government should erect new buildings and thus give employment to labor. There is much interest in this matter. The price is about $2,000,000, and the Government's option, obtained six years ago with the lease, will expire on the 30th. When it became known that the Government intended to buy, vigorous opposition caused delay and further consideration of all the questions involved.

The Outbreak in the Midi The outbreak among the wine growers of the Midi, in Southern France, has been met with a strong hand by M. Clemenceau. He was asked in the Chamber of Deputies what measures were decided upon and he refused to answer until Friday, in order that action might be taken positively. He replied vigorously to an attack by the Socialist leader, M. Jaures, and this brought M. Ribot and the Center to his support. M. Clemenceau said that as long as the manifestants confined their protests within lawful lines the Government had let them alone to prove its sympathy with their desires, but when law was defied, tolerance could no longer be allowed. He said, with much feeling, that if another Cabinet were to succeed it, it would find enormous difficulties, such as some of the Deputies knew and others did not know were most grave. The Chamber, by a vote of 412 to 158, approved the postponement. M. Clemenceau did not hint what graver crisis he referred to, but the monarchical and clerical journals have made the most of the disturbance, attacking the Government and showing how much better off the people were under a monarchy. M. Sarraut resigned as Sub-Secretary of the Interior, but declaring himself heartily in sympathy with the Government, and saying that he resigned to go home and show the people how they ought to yield, but when he returned the mob hooted him back to Paris. Not all the mayors have resigned. Thus one mayor writes that he believes to desert would be *les republique* and cowardly, and adds that behind the movement there is the most miserable and shameful reaction. In some villages an attempt was made to erect barricades, but one of the two leaders, M. Ferroul, ordered their demolition.

Indeed, both he and the chief leader, M. Albert, warned the people not to attack the soldiers. The full facts were not immediately given to the public, but many regiments of soldiers were sent South, as M. Clemenceau was determined on the most vigorous measures. There was really much fear of a rebellious outbreak, but this decisive movement has been successful. There was said to be 10,000 soldiers at Narbonne, but they were not met with much hostility. There were cries of "Long live the army." Only four of the official leaders of the revolution were arrested and others were allowed to escape. The leader Ferroul was arrested without difficulty, but Albert was not found. The orators addressed the troops as they came, telling them, "We love you as you love your friends, and wish you no harm, but we hunger and you will not fire on us." They also provided the soldiers with food. It is an interesting fact that it was possibly due to the effect of the bill past against fraudulent wines that there has been a sharp rise in the price of wine; but the correspondents in the Midi remark that at the restaurants it is easier to find beer and absinthe than the native wines.

The Revolt Suppressed

It is yet very difficult to judge of the extent of the disturbances in the Midi. All sorts of rumors of collisions and deaths were given out as actual facts, but the general conclusion is that there was a surprising avoidance of actual conflict. Perhaps a dozen of the people have been killed, and one victim of the rioting on Thursday, at Narbonne, the sixth man killed, was buried with great pomp on Sunday, crowds attending and a deputy delivering the principal discourse. The most alarming feature has been the defection of some hundreds of soldiers who refused to take part in the suppression of disorder, but who took no further active part in the disturbance. They were troops which, under the usual rule, were stationed in the department from which they were mustered, and who were in the closest relation of sympathy with their fellow countrymen. This made it necessary to call troops from the north of France to maintain order. Much complaint was made of the rough and even brutal behavior of the cavalry, and the Government was asked to withdraw them and use only the infantry. It was when the excitement over the conflict was at its hight, and it had become known that M. Clemenceau was using the army freely to put down the revolt, that on Friday he reported his doings and asked the support of the Chamber of Deputies. The rioters at Narbonne, he said, had been driven from the streets, altho over a hundred soldiers had been wounded. The Premier then told of the mutiny of a battalion of the 17th Infantry, and said that he had demanded their unconditional surrender, which followed. The Opposition deputies fiercely attacked the Government. Among the speakers was M. Millerand, former member of the Cabinet, but whose address was not well received as it was understood that it was a bid to succeed M. Clemenceau as Premier. After a debate of six hours M. Clemenceau was supported by a vote of 327 to 223. The effect of this strong majority was very favorable, and influenced the more quiet condition in the disturbed region. Indeed, it does not seem to have been the desire of the leaders that there should be any active violence. When barricades had been built in the streets they ordered them removed. The rioters were largely youth whom M. Clemenceau characterized as Apaches and toughs. The journals spoke of these youth as belonging to monarchical and old Catholic families, but Clemenceau was content to speak of them as anti-Republican. A ridiculous but characteristic incident was the appearance of M. Marcellin Albert, the chief leader of the manifestants, for whom the police had been vainly searching for days, at the office of the Premier in Paris, drest in the characteristic countryman's garb of the Midi. He had come apparently without concealment and drove in a cab and presented his card, and was admitted to a private interview of nearly half an hour with M. Clemenceau. Being a visitor he was not arrested, but, the official report says, was soundly rebuked, told to report himself to the proper officers, and to use his influence with his countrymen for peace, which he promised to do. Just how much truth there is in this story we may doubt, but his sensational appearance in Paris is having a good effect in

the Midi. On Sunday all was quiet, altho some journalists claimed to see behind the quiet a resolve to renew the disturbance. The most serious feature has been the defection of certain troops, and the failure of anti-Republican leaders to appear and use the disaffection of the people for the overthrow of the Republic. The district which has been in revolt covers about 10,000 square miles and has a population of 1,500,000. The military are in full control, and have to deal with nothing worse than scattering mobs.

The House of Lords

We have previously mentioned the resolution offered in the House of Commons by Prime Minister Sir Henry Campbell-Bannerman, to the effect that there must be a change in the composition or powers of the House of Lords, so that they cannot finally balk the will of the people. His complaint was formulated in an address at Plymouth, in which he said:

"The Lords have abused their powers within the Constitution. In assigning them their proper place, as it is our purpose to do, we are defining the position of the Lords under the Constitution. Remember we are forced to this struggle by circumstances, and this is the climax of a series of attacks on the rights and liberties of the House of Commons.

"The time for compromising, temporizing and verbal expostulation has gone by; we must give the Lords to understand that while we are perfectly ready to legislate with due deliberation and give every weight to their representations, the British people must be masters of their own house."

But for a while it looked as if Campbell-Bannerman's resolution had been shunted aside by a bill offered in the House of Commons by Lord Robert Cecil, who is of the Conservative Opposition, proposing a measure of reform of the Lords. It is a rule of the House that no resolution shall be considered as to which there is a bill on the docket, and this act of Cecil's was regarded as a clever ruse to sidetrack and annoy the Prime Minister. But later Cecil withdrew his proposed bill. The resolution will now come up for action early this week. The text of the resolution reads:

"That in order to give effect to the will of the people as expressed by their elected representatives it is necessary that the power of the other house to alter or reject bills passed by this house should be so restricted by law as to secure that within the limits of a single Parliament the final decision of the House of Commons shall prevail."

The Hague Conference

Somewhat to the surprise of the Conference, at its second session Gen. Horace Porter, on behalf of the United States, reserved the right to present the question of the limitation of armaments, and also that of the right to collect contractual debts by force. It is now believed that the United States will present the subject of limitation of armaments if no other Power does so. Great Britain reserved the right to present other topics, but without fully specifying them. Germany gave notice that it intends to introduce a proposition for an international prize court, to which appeal could be made in a time of maritime war, and the proposition was seconded by both Great Britain and the United States, a fact which made a good impression. French is recognized as the language of the Conference, but speeches in other languages are to be summarized orally by a secretary, who acts as interpreter. The South American countries did not present the Drago doctrine. Indeed, a Brazilian delegate said the doctrine is not popular in his country, as Brazil much needs foreign money for the development of its industries, and it is not desired to take any action which would discourage investments. The most important act of the second session was the appointment of the four great committees, as follows:

First: Arbitration—President, M. Bourgeois, France; honorary presidents, Merey von Kapos-Mere, Austria; Sir Edward Fry, England; Ruy Barbosa, Brazil; vice-presidents, Dr. Kriege, Germany; Signor Pompili, Italy; Señor Esteva, Mexico.

Second: Land War—Presidents, M. Beernaert, Belgium, and M. Asser, Netherlands; honorary presidents, Baron Marschall von Bieberstein, Germany; Gen. Horace Porter, United States; the Marquis de Soveral, Portugal; vice-presidents, Constantin Brun, Denmark; Dr. Beldiman, Roumania; Dr. Carlin, Switzerland.

Third: Maritime War—President, Count Tornielli, Italy; honorary presidents, Joseph H. Choate, United States; Tseng-Liang, China; Turkhan Bey, Turkey; vice-presidents, Herr Hammarskjold, Sweden; Dr. Drago, Argentina; Baron d'Estournelles de Constant, France.

Fourth: Geneva Convention—President, Professor de Martens, Russia; honorary presidents, Señor Don de Villay Urrutia, Spain; M. Kurachi, Japan; vice presidents, Sir Ernest

Satow, England; Professor Lammasch, Austria; Dr. Hagerup, Norway.

The United States was awarded two honorary presidents in the persons of Gen. Horace Porter and Joseph H. Choate.

Rioting in Lisbon

Notwithstanding the censorship of the Portuguese press the news has leaked out of a serious riot in Lisbon, which almost threatened a revolution against the Crown. Prime Minister Franco, after dismissing the Parliament early in May, instituted a governmental decree, being supported in this by King Carlos. This has caused great irritation, and open hostility against the King and royal family, while Prime Minister Franco is styled the Dictator. He was making a journey to Oporto in the hope of securing a popular endorsement to his policy, but at every station from Lisbon the crowds hooted and hissed as his train past. At Oporto he was howled down when he tried to speak, and the disturbance grew into a riot, in which the troops fired into the mob, and several were killed and wounded. On returning to Lisbon Senhor Franco was met by a furious riot outside of the railway station. The cavalry charged the mob, and the infantry fired into it, and many were killed and wounded. The principal fighting was under the windows of the Hotel d'Angleterre. The flagstones were torn up to supply weapons for the mob, and women carried their aprons full of stones. There were cries of "To the Palace," but the King was not there. There was no little fear that a revolution was at hand, but the vigor of the troops and the numerous arrests seem to have controlled the situation.

The International Socialist Congress

A great international congress of Socialists is to meet at Stuttgart in the second week in August, and a conference was held the other day in Brussels to prepare for it. In the Congress France, Germany, Russia and England will have each 20 votes; the United States, 14; Italy, Belgium and Austria-Bohemia, 12 each; Poland, Switzerland, Denmark and Holland, 10 each; Sweden, 8; Hungary and Norway, 6 each; Spain, Japan and Servia, 4 votes each; and Luxemburg, 2 votes. It will be observed how large is the proportion of Socialist strength allowed to the United States.

After the Duma

The three advanced parties in the late Duma — the Social Democrats, the Social Revolutionists and the Group of Toil, will issue one common appeal to the Russian people. In substance this sets forth that the Duma from the first championed the rights of the people against governmental absolutism, and strove, thru its Agrarian Commission, for the compulsory expropriation of the landlords' estates for the benefit of the peasants. This, it is declared, was the real reason for the dissolution. The new so-called Duma, the manifesto says, will be composed of landlords and nobles, who are enemies of the common people. "Let the nation," it says, "defend by force the honest popular representation embodied in the late Duma." In Poland there is the greatest indignation and gloom at the news of its practical disfranchisement by the edict of the Czar. But there is no likelihood at present of serious disorders. Around Warsaw are 35,000 troops, which can be massed at any given spot. The people have no way of defending themselves. A general strike will not be ordered, as the revolutionary groups have voted against one, on the ground that it would play into the hands of the Government. Details have come of the mutiny at Kieff, but it was a disastrous failure. Five hundred men, at a given signal at midnight left their beds, disarmed the sentries, but they were easily overpowered. There have been many arrests and the prisons are overflowing. The Radical papers have been all suppressed and many fines have been inflicted. Three thousand people are reported as having been arrested in Odessa alone, and at Kieff forty-eight mutineers have been condemned and shot. By imperial ukase the governors of eight large provinces have been empowered to suspend newspapers, disperse meetings, banish undesirable persons and take other measures for the maintenance of public security by administrative process without having resort to the courts, and to inflict punishment up to three months' imprisonment and $500 fine.

Governor Hughes as a National Character

BY FRANK H. SIMONDS

[Mr. Simonds is the Albany correspondent of the New York *Evening Post*, and is especially competent to treat this subject.—EDITOR.]

IN a crowded street car, in an up-State city, the other day, a State politician overheard two citizens discussing the State government.

"This man, Hughes," said the first, "he has surprised me; he has made good."

"That's not where the surprise comes in," retorted the second. "What gets me is that he has made good better than he said he would. The President makers will have to reckon with Hughes."

Then, because this sort of *obiter dictum* of the voter in undress interests the politician, the eavesdropper adopted it and repeated it.

A Governor of New York State who "makes good," however, is always entitled to his day in the court of Presidential "booms." When such a Governor makes performance outrun promise and achievement surpass prophecy, then that day may be less fleeting. Such, moreover, is the conceded fact in the case of Governor Charles E. Hughes. Yet, since the States are many and their Governors almost innumerable, such "booms" may be idle in the end, if they have no other basis. Cleveland and Roosevelt, Hughes's most distinguished predecessors at Albany, embodied an idea that was national, quite as obviously as they achieved a success which was local to their State. It is, then, with an eye to the national value of the recent triumphs of Governor Hughes that one may, perhaps, most profitably scan the history of the recent "Siege of Albany," as it is called at the State Capitol.

It is obvious, however, that it is impossible to discuss the national possibilities of the man Hughes until one reviews, in brief, the record of his achievement as Governor. Nor is the record the less impressive because of its wide advertising. In six months this quiet corporation attorney, lacking in political training, destitute of even rudimentary partisan experience, has subjugated a State machine, overthrown a legislative cabal and secured for the people of New York the passage of more important and more progressive legislation than the legislative mills of Albany have ground out in a decade. In his first official act, Governor Hughes foreshadowed his break with the State machine, which had dominated Governors and made its will felt at Washington for a generation. The machine, thru its titular head, the State Chairman, demanded the appointment of an insignificant political lieutenant to an important place of public trust, for which he was obviously unfitted. When the Governor declined, the machine abandoned him; henceforth its authority, its influence, its discipline no longer supplied weapons to his hands. He had declined to purchase personal power at the price of public office; all that followed was, in a sense, the result of this act.

The details of this battle are too recent and too complex to warrant repetition. A Legislature, permeated with the traditions of the methods of Platt and the tactics of Odell, still reeking with the abuses which the Armstrong Committee had exposed rather than destroyed, bade

defiance to an inexperienced Governor, blocked his program, ignored his recommendations and mocked at his methods. Yet it is these same methods which must most interest the student of Governor Hughes. The battle itself is as old as the institutions of Governor and Legislature. Hill, Cleveland, Roosevelt, Black and even Higgins have fought with their legislatures. But they fought in the approved fashion; they fought with the weapons of power rather than principle; appointment, veto, patronage, these were the weapons of other Governors. Moreover, as they fought, they paid: public office was the spoil of personal contest, and however good the Governor, however righteous his cause, he was yet compelled to reward morally bad followers for their support, in the currency of public office. It was the unique contribution of Governor Hughes to such warfare that he declined to follow this course.

"I will appeal to the people," said the new Governor in January. In March he did appeal. But even here there was an unusual circumstance; his "appeals" were calm, unimpassioned legal arguments. "Insurrecting the public mind" had become the accepted method of the reformer, but this Governor sought to convince, not to "insurrect," and as a result aroused criticism, even from his friends. Yet those appeals were amazingly successful. Three weeks after they began an insolent and hostile Legislature was on its knees and a resentful and unsympathetic party was overtaken by a ludicrous panic. More than all else, there was rewritten in the laws of public life that forgotten dead-letter law, that the people were the bosses' bosses.

At precisely this point, moreover, it is important to note the purpose that had underlain all Governor Hughes's course of action. It was neither radical nor destructive; it sought, first, to restore the Republican party, his party, to the confidence of the people of the State, and, secondly, to restore the control of his party to the majority of its membership, who made up a majority of the people of the State. It was natural that the man who campaigned the State against Hearst should see that his opponent's strength lay in Republican weakness. Nor could he fail to recognize that Republican weakness lay in the fact that the control of the party was vested in the Platts, Odells, Woodruffs and their ilk, who had dominated the party and trafficked in its legislators for a generation.

To accomplish this program two things were necessary for Governor Hughes: first, to eliminate the politicians from power, second, to dominate the Legislature, thru the aid of public opinion, in such fashion as to make it respond to public demand and pass reform legislation. Having eliminated the politicians, he turned to the second task. In his Public Utilities Bill, he embodied the most important portion of his reform program. But here again it is necessary to avoid too wide generalization. The bill provided for the regulation of public service corporations, but other laws had already been enacted to accomplish this. Here, then, was no radical departure; it was rather an effort to revitalize than to create. State commissions drew salaries for regulating these corporations, yet every passenger on a street car and every consumer of gas in the metropolis knew that the only function of these commissions was to protect the corporations they were paid to regulate against the righteous demand of the people, whose servants these commissioners were. Because the commissioners were Republican politicians and the corporations contributors to Republican campaign funds, the public had concluded that the party had sold out the people. When Governor Hughes's Public Utilities Bill had become law, the people were satisfied that a Republican Governor and a Republican Legislature had kept the faith.

A further review of the Governor's year is not vital to a discussion of the wider aspects of the Chief Executive. It is, moreover, all of one part. He found public sentiment demanding that the votes cast in the last New York City mayoralty election be recounted. Back of this sentiment lay the conviction that one man had been elected and another seated. Involved in this issue he saw a false strength afforded to an undeserving martyr. In the face of public sentiment, he found the leaders of his own party juggling with the moral issue for the partisan advantage involved. Accord-

ingly he thrust aside the sophistries, annihilated the petty logics and demanded a law that would do equal justice to all concerned. As usual, he had his way. Similarly, he found a Superintendent of Insurance whose unfitness lay open to all men. Yet his best friends advised him to refrain from attacking Otto Kelsey, because such an attack would afford opportunity for the politicians to rally to protect their own and such a rally might defeat his whole program. Governor Hughes refused the compromise, accepted certain defeat, and the event proved that this defeat generated the necessary public sentiment to drive thru all his other projects. To have temporized might have meant to lose all, but the man Hughes does not temporize.

From another danger this singleness of purpose saved Governor Hughes. At the critical moment in his year, President Roosevelt removed a collector of internal revenue in Western New York. At the same time it was announced that the President would replace this man by one chosen by the Governor, and that the whole weight of Federal patronage lay at the Governor's command. Before such artillery his enemies indicated their instant readiness to surrender. Yet, to this day, Governor Hughes has failed to accept the offer. His refusal was almost brusque in its completeness. Nor is the reason far to seek. He had declined to employ patronage at his own disposal to win his fight. He recognized that to accept this proffer was to incur obligations that must be liquidated. A national campaign was at hand and delegates to a national convention were already sought, and a national administration was committed to one candidate. But Governor Hughes was not playing national politics, but seeking solely to restore a State party to State confidence. He chose, therefore, to fight single-handed, that victory might bring no qualified result.

In the end, Governor Hughes has emerged from his battle triumphant. Even against its will, he has placed his party upon a sound public basis. Under his direction the party bosses have gone to the rear, the voice of the voters has become mighty in the counsels of the Republican party. Seeking to restore confidence, he has first stimulated a sense of individual responsibility. In the triumph of his legislative program, moreover, the old corporate-politician domination has been shattered. In the face of public sentiment the politician has not merely surrendered; he has abdicated. Here is the permanent significance to New York State politics and public life of Governor Hughes's administration. Accepting the derisive term of his opponent—"animated feather duster"—Governor Hughes has given his party the good old-fashioned New England "housecleaning."

Yet all this does not make Governor Hughes a member of that Hall of Fame populated by "national figures." Important as his service has been, these accomplishments lack a national appeal. Here are shown courage, insight, executive ability and cool judgment, but these are only the framework of national possibilities. Alone, they would not carry a national boom beyond the Alleghenies nor south of the Delaware. Where, then, shall one find the other phase? The answer comes best, perhaps, in a news item of last week, announcing that the Wisconsin Legislature, after listening to the reading of Governor Hughes's veto message destroying the Two-Cent Fare Bill, adopted its policy and defeated a similar measure. Into this message is written the national side of Governor Hughes, and its significance has already traveled out to the nation.

"In dealing with these questions," Governor Hughes wrote in that message, "democracy must demonstrate its capacity to act upon deliberation and deal justly." The whole spirit of the message is summed up in the concluding paragraph, protesting against the acceptance of the spirit back of such legislation, which meant, so he wrote, that "At a critical time, when the interests of all demand that reason and judgment should control in dealing with such matters, we should have abandoned our true line of action and facilitated still wider departures." Any Wall Street lawyer might have written this, but, coming from the author of the Public Utilities Bill, it had its own startling significance. The plain fact is that circumstance has contributed to confusing a just estimate of the temper of the man Hughes. His investigations and

his legislation have written him down a radical, his temper and his training make him a conservative. He is, in fact, an economic conservative and a moral radical, the composite product of the training of a Wall Street law office and a Baptist parsonage.

It is this peculiar combination of moral radicalism and economic conservatism that must constitute Governor Hughes's real claim to national consideration. It makes him the natural candidate of that party which shall seek to foster reaction from the hysteria of the present phase of public life, and to escape from the consequences of the present tendency toward unreasoning war upon the existing economic system as a totality. As the candidate of such a party, moreover, Governor Hughes will, by his past record of achievement, escape any charge of seeking to protect excesses and shrinking from curbing abuses of existing systems. He will never be open to the suspicion of being "safe and sane" in the sense this phrase was used three years ago. Then it meant safely deaf and sanely blind to corporate evils, which cried out for remedy. With such theories Governor Hughes can have no sympathy. On the bench he would be a "hanging judge," in the civil courts his application of the law would be drastic and remorseless. But in judicial or other official capacity Governor Hughes's activity would end within the law and his actions never become extra-legal.

Glancing back over the record of his year in office, it is possible to apply this theory to Governor Hughes specifically. At the outset his activity was advertised as destructive. No protest of his could shake the conviction that he sought to destroy a corrupt Republican party; that he sought to erase a discredited Legislature; that his whole mission was iconoclastic, in harmony with an iconoclastic era. Yet at the end not destruction, but construction, has been the result. He has revitalized his party, restored some measure of public confidence in the Legislature; above all else has shown himself animated, not by the spirit of the anarchist, but by the instinct of the surgeon. In all this he did but apply to the existing political system the same method and the same philosophy that his veto message indicates that he feels toward the existing economic system. It is as the exponent of the application of the Common Law, as opposed to Lynch Law, to corporations, political institutions and individuals, that Governor Hughes must be a national figure, if at all.

It should be added that no circumstance will ever make Governor Hughes an active candidate for presidential honors. The efforts of designing politicians and enthusiastic friends will not avail to stir him. In their machinations and their scheming he will have no part. The only bid he will make for national preferment is comprehended in a ceaseless, tireless, endless activity in his present office. Nor will any campaign develop in him those qualities which beget affection and arouse familiarity. He has been called a "logic machine" and "a reform lawn-mower" by those who have sought to express the immense impersonality of the man. Enthusiasm and passion are equally remote from his mind and his method; reason and logic are his substitutes. To replace personality by principle is his whole theory of public service and the ideal of his public career. Yet these qualities are only manifestations of the same spirit, which must comprehend his claim to national honors. They only emphasize the conservative that underlies all else in his nature.

Recent history has created by cartoons two exaggerated, yet accepted, factors in American economic and political life, "The Trusts" and "The Common People." It is as the compromise candidate of both, subservient to neither and cognizant of the rights and the wrongs of each, that Charles E. Hughes, at close hand, seems most likely to achieve national importance.

ALBANY, N. Y.

Dogs as Policemen

BY GUSTAVE ABEL

[The author of the following article is editor-in-chief of a well-known progressive Belgian daily, *La Flamande Libérale*, published at Ghent.—EDITOR.]

THE rather startling innovation of utilizing sheep dogs as an auxiliary to the police force of great cities is spreading thruout Europe. It may be interesting, therefore, to give the history of this custom in the place where it first came into existence, and then to tell briefly in what it consists.

The Belgian town of Ghent has a population of 170,000 souls, of whom 80,000 are workmen. Its circumference is about fifteen miles and its surface about 6,400 acres. So, as the population is scattered over a pretty broad surface, the policing of the city became rather a difficult proposition. Complaints were being continually made to the municipal council about the lack of police protection, but as it would have required a great outlay to remedy the evil, the authorities hesitated to vote the necessary funds. One day when the Mayor, Mr. Emile Braun, was examining the question with the chief of police, Mr. Van Wesemael, the latter exclaimed: "If you can't give me men, then give me dogs!" At first the Mayor thought he was joking, but finding that he was quite in earnest, and himself being a man not afraid of trying new things, asked for further explanations of his suggestion. Mr. Van Wesemael, who is recognized as a very able police superintendent, and who unites vigorous action with careful and intelligent study of details, had already examined with attention this matter of dogs as policemen. So he replied:

A GHENT POLICE DOG.

"The weak spot in our organization is the small number of night watchmen in the out-of-the-way parts of the town, and especially along the wharves, where a large number of thefts take place between sunset and sunrise. An officer is exposed to great danger in these deserted spots and his life is in peril when attacked by toughs whom he has surprised in the act of stealing. However strong our force may be, we cannot remove this disagreeable side, nor can we ever hope to prevent crime there. But let me have, as a trial, three dogs, which I shall choose, and I am certain that the results will be wonderful. A dog can follow a fleeing man swifter than a police officer. He is more nimble; he is full of courage, and evildoers are terribly afraid of him. No man has the keen sense of smell and hearing of a dog. Then, again, he can squeeze in anywhere. If he is well trained—and I will see that this is done—his usefulness will be tenfold greater."

Mayor Braun was convinced, and three dogs were forthwith bought. Two months later two more were added to the force, and we now have thirty. And Mr. Van Wesemael kept his promise as regards their training. In fact, it is just here that he has produced the most wonderful results and won the highest praise from all those who have examined his system. Among the foreigners who have thus admired his work are delegations from several French and German cities, and the Chinese Government.

A GHENT POLICE DOG ATTACKING A CYCLIST.

As everybody knows, dogs can be so trained as to be useful in war and for hunting. The problem our chief of police had to solve was to so train them that they would catch tramps and bad characters in general; and this is how he proceeded to bring about this desired result: During the first two weeks the dogs are simply kept in their kennels, where they are taught obedience, and then are slowly initiated into their future work. They are first taken, every evening, to the place where the night watchmen gather before starting out on their beats, where they get acquainted with their future masters, who win their affection by giving them bits of liver to eat. During the early months the dogs stay out of doors only two or three hours every night, but later on this period of work is lengthened to eight hours. They are taught how to search for thieves, how to lead the policeman to some hidden spot where are footpads and the like, how to obey promptly when ordered to pounce on a malefactor, how to return quickly to the policeman on the first signal to this effect, how to swim and how to answer immediately the whistle of a night watchman calling for aid from a neighboring post. Furthermore, they are expected to defend a policeman when he is attacked, to follow anybody who is running or who is carrying a large parcel, and to scent out tramps lurking in hiding. To prevent the dogs from getting too familiar with other people than their masters, they are taught to be distrustful of everybody but the police. This training takes three months. The animals are looked after by an officer in plain clothes, whom the dogs suppose to be foreign to the police force, and who is thus able to get up sham attacks on the men. Each dog always watches the same section, and is associated with the same officer, of whom there are a hundred and eleven, distributed over as many different sections. There are eight lieutenants, one captain and one inspector. These make up the staff of the dog branch of our police force. A night watch begins at 10 o'clock and continues without a break till 6 a. m. This has taken the place of the old system, by which different men came on in turn. The advantage is that the policeman being on the same beat the whole night knows everything that is going on there during this lapse of time.

Now let us consider one of these trained dogs at his work. In the first place a good muzzle had to be found. Mr. Van Wesemael invented one which meets the requirements. It consists of a cup of hard perforated rubber, with a single opening quite at the end, which makes breathing easier and allows the dog to drink. By pressing a spring, the apparatus falls off of the dog's nose and hangs attached to his collar. So now the animal is ready to go out on the beat. He is never set on a person until this person has refused to stop when ordered to do so by the policeman. In this case, the dog springs at his throat, knocks him down and holds him till the policeman can come up. Our force cites many instances when a criminal would have escaped if it had not been for these dogs. In one case the scent crossed a ditch filled with blocks of ice; but the dog brought down his man. On another occasion, one dog kept a whole band of tramps at a standstill until the police came up and captured them. One of these sagacious animals named "Tan" has a reputation at Ghent that any detective might envy. One night on the docks, he saw a fellow hurrying away with a suspicious looking bundle. He followed him barking until the police officer's attention was attracted, when the man was stopped, the contents of the

parcel examined, and it was discovered that the goods had been stolen. The thief proved to be a very dangerous criminal. Several of the dogs have received honorable wounds in their fights with roughs in the suburbs of our city. But as a rule a few well-placed bites generally cause the criminal to surrender, but if he manages to get away, his trail is soon found. It has been remarked, that once caught by the collars of their coats, thieves are so scared by the formidable teeth of their four-footed enemy that they can be taken to the lock-up as easily as if they were sheep. But if they show fight, they quickly see the grave mistake they have made; the dogs don't handle them with gloves. It has been found that drunkards especially have a dread of the canine policemen.

Many of these points and still others were brought out during recent experiments made at Ghent in the presence of the town authorities, representatives of the press and some foreign guests. The chief feature on this occasion were men on bicycles or on foot trying to get away from the police dogs. Suffice it to say that in no case did a man succeed in escaping from the animals. Their manner of stopping a bicycle is to throw themselves fearlessly into the front wheel, which overturns rider, bicycle and the dog, too, and all are tumbled together in a confused mass on the ground.

A peculiar feature of their training is the respect which they are taught for the police officer's uniform. They will always protect a policeman in uniform. But let the same man take off his uniform and begin to act the part of a tramp, and the dog will attack him at once. The intelligence they show in answering the whistle is also very notable. They are not deterred by shots, and will jump savagely at the hand holding the pistol. It will be seen that the life of these animals is very strenuous, and it will not surprise your readers, therefore, to be told that a police dog lasts but from five to eight years, when he is worn out and is honorably discharged from the service.

A governor of one of the neighboring French departments came to Ghent not long ago to study this question of police dogs and went away astonished; and no wonder, for here are some of the things that he saw: At eleven o'clock at night, a man hid himself among the thickly huddled-together tombs of the Ghent cemetery. A muzzled police dog was then let loose upon him, and in a marvelously short time the man was found and brought in amidst the warm applause of the spectators. Next, an experiment was made on men who were supposed to have broken into a house. At a whistle from one of the policemen on the spot, six dogs came running in from neighboring police stations, which in some cases were a thousand yards or more away, and performed their part in the arrest of these pretended robbers. Finally, a group of men acted as if they were drunk and got into a fight with one of the policemen, whereupon the dogs came to his rescue, attacking the aggressors in a most energetic fashion, springing so high as to strike with their muzzled noses the faces of the men. The spectators, official and otherwise, were really astonished at the value of these auxiliaries, and these ex-

A GHENT POLICE DOG BEING ORDERED TO ATTACK A MAN.

periments, tried for the first time in the worst quarters of the town, produced a most salutary effect on the criminal classes thereabouts. The fame of these experiments reached France and the head of the Paris police sent an agent to Ghent to look into the matter. The result was that he carried back with him to the French capital three young sheep-dogs named "Black," "Duke" and "Bob," which were nearly completely trained. A public exhibition of their talents was given one night in an enclosed ground near the Porte Maillot entrance of Paris, and the whole neighborhood was thrown into consternation by the cries of "Thief!" and "Help!" as well as by the continual whistling for the dogs. But when the cause of all this was learned the next day, the peaceful inhabitants were so delighted at the idea of having their police protection increased, that they forgot one sleepless night; and the result is that the Paris police force is also going to try our system.

We have now in our country a Belgium Shepherd-Dog Club, whose aim is to improve and spread the introduction of this dog-police. They award training honors at public trials. Thus—I quote from their printed official list of rules:

"On an order from his master, the dog must walk along with him, behind him, or in front of him. This counts 20 points. He must go and fetch an object pointed out to him. Five points. He must keep watch over an object when the master is absent. Ten points. He must find an object, which has been first shown him and then hidden within a radius determined by the judges. Ten points. He must find a man whom he has seen, but who has hidden himself within a certain radius. Fifteen points. Broad jump, 10 points. High jump, 10 points. Climbing over fences, 10 points. Defending his master, 15 points. Attacking anybody pointed out by his master, 10 points."

The list is considerably longer, but this suffices to give an idea of the whole.

The wonderful intelligence of dogs is well known, and many are the examples of this fact offered by these police dogs. Their highly developed power of scent is especially noticeable in this connection. Let me give one remarkable instance of this, which happened last year. On June 3d a girl of eleven, named Helen Bebenroth, was assassinated on the Hagenhof estate near Koenigslutten, and tho every effort was made to find the murderer, the police made no progress. Four days after the crime the district attorney called in the police inspector of Brunswick and asked him to put his police dogs on the case. So "Harras" and "Cæsar," two German shepherd dogs, were taken in a motor car to the spot and "Harras" was introduced into the room where the child was murdered, and was left there for some twenty minutes. In the mean time, the judge had all the servants lined up in the garden. When the dog came out of the room into the garden he began sniffing around, stared about for a moment, made several turns of the garden, jumped a ditch and entered by a door that had been left open into the house of a certain Dune, where he smelt all the workmen and suddenly stopped in front of the eighth one. Then he backed away from him, returned to him and finally jumped on him. The night was very dark, and it was impossible to distinguish at first who was the man that cried out at this moment. But on inquiry the inspector found that it was Dune. Twice more the dog was locked up in the room, the men changed places, and twice the animal sprang at Dune. During the following night the forlorn man admitted that he was the guilty one!

Let us glance for a moment at the financial aspect of the question. In this connection, I confine my attention to Ghent. We needed twelve more night watchmen, which meant an increase of our police budget by 12,000 francs per year. Now it is admitted that thirty dogs are equal to sixty men in this matter of police. The cost of keeping a dog varies from five to six cents per day, so that those sixty dogs would cost us 3,285 francs, instead of 12,000! Nothing further need be said on this point.

But it is not simply the economical side of the system that recommends it. There is no doubt of the very important fact that there has been much less crime in Ghent since these dogs "came to stay." Nor is this our opinion alone. Some hundred and fifty German towns have examined into what our police are doing on these lines, and they have all concluded that cheaper and more thoro work is done when dogs are added to the police force.

Herr Laufer, chief of the police of Schwelm, was the first of these Germans to adopt our system. He came to Belgium and studied the innovation, not only as it is seen at Ghent, but also at Schaerbeek, a suburb of Brussels, at St. Gilles, Antwerp and other Belgian cities. France, too, has followed the German example, and dogs are now found in the police force of Paris, Pont à Mousson, Verdun, Epinal and Roubaix. From America, also, has come more than one request for information, one of the latest received by Mr. Van Wesemael being from Mr. Perrin, of the South Orange, N. J., police board, who highly praises the system, and says it has been introduced with marked success in his town. In his letter, he states that his board is not yet sure which is the best breed of dog to use for this purpose.

GHENT POLICEMEN AND POLICE DOGS.

I may say in this connection that the breeds finally chosen at Ghent are the tall Belgian sheep dog, with short, stiff hair, or with long hair, like the Brie, and the Groningen dogs, and also the ordinary French shepherd dog, with long, stiff hair. These breeds are distinguished for endurance, courage, audacity, fidelity and their wonderful powers of scent; their powerful jaws also command respect. The question is also sometimes asked, at what age the dog should be used. The police departments of St. Gilles and Schaerbeek hold that it is impossible properly to train the dogs before the age of ten months. But here in Ghent we begin their education at six months.

A few more words about this training may prove interesting. In Ghent, it is absolutely forbidden to let any one caress the dogs that are being trained. Even the policemen must not show them too much affection. They are patted and caressed only when they have done some fine piece of work; it is a reward and an encouragement. As has already been said, prompt obedience is the main lesson inculcated; and to secure this a certain amount of punishment is permitted, tho the culprit must be at first only threatened with punishment and the real thing administered as a last resort. The reason for proceeding in this way is because it has been found that a badly treated dog always becomes a coward. Another rule is not to let the animals pick up bones to crunch. They are fed only in their kennels. Otherwise evil-intentioned persons might give them poisoned food. They are kept muzzled also for this same reason, for then there is no danger of improper food passing

their mouths. If a dog on duty dies suddenly, the police instructions inform the policeman that he must be on the lookout for danger. He is to leave the dog where he has fallen, continue his service alone, and the next morning the animal is carried to the municipal slaughter-house, where the body is examined to see what was the cause of death.

A few details as to how the dogs are cared for may be valuable. Thus, in winter they wear a blanket of tarred sail cloth bordered with leather, which is fastened to the collar and passes under the belly. The kennels, which are very comfortable, are built of bricks and wood, and are placed in the garden of the central police station. They are washed out every week and are disinfected with creolin; twice a year they are whitewashed. The dogs are fed twice a day—at seven in the morning and at seven at night—on "Kneipp," which consists of a mixture of broth, meat, rice and black bread. Each ration weighs about three pounds. During the night each dog receives a large slice of bread. A veterinary surgeon and a drug shop are especially provided for the kennels. The history of each dog is carefully kept on a register *ad hoc*. Thus are noted the day of their birth, when they were bought, whom from, the price, sex, and, if necessary, why they were dismissed from the service.

But there is nothing new under the sun. Far back in the olden times dogs were used to protect cities. Louis XI, who ruled in France before Columbus discovered America, provided that famous spot, Mont Saint Michel, with a dog corps, and St. Malo, hard by, was excellently protected in those stormy times by a canine posse. But Ghent is the first town, past or present, which has established a systematic and regular school for the training of police dogs, which has put in practice the use of the animals when once trained, and has introduced into the police establishments of the world a new and valuable element, which has received the approval of every municipality that has tried it.

GHENT, BELGIUM.

The New Park at Rockaway

BY HERMAN A. METZ

COMPTROLLER OF NEW YORK CITY.

ROCKAWAY PARK, the great four-mile stretch of sea beach on Long Island, only about an hour from the city, is to be for the sick rather than the well. The first idea we had on the subject was that we would use it especially for convalescents, those afflicted with tuberculosis of the bone, for which disease fresh air seems to be the great cure.

But the original idea has been greatly extended and now it seems as tho all the hospitals and fresh air institutions desire to be represented at Rockaway. If this project goes thru the various fresh air institutions which are now established at Coney Island—the seaside homes for children belonging to the different religious denominations—will all move to the Rockaway place and turn over to the city their Coney Island land.

Rockaway is one of the best places in the United States for seaside hospitals; the beach is magnificent, the air as pure as the sea can make it, and there is always a cooling breeze.

But the whole thing is in embryo yet. The only real forward step taken has been that by the Board of Estimate in placing upon the map and authorizing condemnation of certain Rockaway land. This land is situated about four miles from the extreme west end and lies immediately east of the two miles of beach known as the Harriman tract. There is 7,000 feet of beach frontage in the plot we are considering, and it runs thru from the Atlantic Ocean to Jamaica Bay, so that there will be all kinds of water available—the turbulent surf and the quiet bay, for bathing or boating.

I doubt that the people generally will

get much use from the Rockaway Park; the prospect now is that the hospitals will pretty well monopolize it. But the people will get something much better than a park at Rockaway that they could not use because of the high fares. They will get a fine, spacious free beach at Coney Island, where they need it, and where they can use it. We will give the seaside homes that are there now larger space at the new place and a little money for their Coney Island holdings. The hospitals are unanimously in favor of our scheme. They have come together for united action and the general prospect seems favorable.

But the details have yet to be worked out. The next thing to be done is to have the property surveyed under the direction of the Chief Engineer of the Board of Estimate Mr. N. P. Lewis. That is being proceeded with.

NEW YORK CITY.

China's "Divine Discontent"

BY COURTENAY HUGHES FENN

[Mr. Fenn is a missionary of the Presbyterian Board at Peking, and was in the British Legation during the famous siege by the Boxers. He is thoroly qualified to write on Chinese affairs at a time when, next to Russia, China is the most interesting nation in the world owing to its rapid acceptance of Western ideas and methods.—EDITOR.]

IF there has been one thing more than another which the friends of China have sought to arouse and cultivate in her, for many years past, it has been the spirit of discontent. The most sturdy and stubborn enemy to all hope of change and progress has been China's supreme satisfaction with herself and all that pertained to her. Her form of government, her educational system, her merchandise, her modes of transit, her language, her literature, her social customs, her ethics and her religion were, in the eyes of rulers and people, the best in all the world; her civilization the only one worthy of the name. But of late she has been steadily going down the list, opening her eyes, little by little, to the fact that her government is not only corrupt, but antiquated; her educational system not only narrow, but shallow; her merchandise not only crude, but costly; her language not only difficult, even for her own people, but distinctly clumsy; her literature not merely obsolete, but, in the main, paltry; and she is now at the point of realizing that her social system is not only intensely artificial, but exceedingly wasteful; her filial piety a euphonious name, her sexual barriers mere empty and ineffectual prudery, her elaborate etiquet extravagant of time and strength and destructive of manly sincerity. Whether she will go on—and if so how soon—to the perception of other defects in her ethical system, and of the hopeless folly of everything that goes by the name of religion among the beliefs and observances of her people, is a question on which there will hardly be two opinions, if one but looks for a moment at the tendencies of the times. The vast majority of her temples are either being transformed into schools or tumbling to pieces. Those which are so solidly built as to be able to endure many decades of weather-beating are being deserted by their priests, who, no longer supported by the people, are compelled to betake themselves to other occupations, while some are almost starving, even their former rather lucrative employment of begging having ceased to bring in the old return. Many of those which are kept up are ancestral temples, and are maintained more from the sense of family pride than for any other reason. Just across the street from our compound there stands a ruined temple, the land connected with which we greatly need for our Theological Seminary Chapel. As it stands, the ruin and land are not worth $100, but the owner asks about $300, in order that he may be able

elsewhere to erect another smaller family temple, to save the family "face," tho he frankly admits that the idols which he would set up therein are false.

The existing anti-foreign sentiment thruout the empire seems to be, in part, a similar effort to "save face" on a larger scale. China has ceased to be ashamed to confess, to the world and to her own people, this great discontent which has taken possession of her; but, at the same time, she cherishes a rather ugly grudge against the people who brought it about. She will thank them moderately for her awakening; but the sense of having had to be awakened to find herself so far behind has been as irritating as it is to the nodder in sermon time. She would gladly drive far hence her pinchers if she could; but, as she cannot, she will at least convince them that she is now so thoroly awake that she needs no more of their rather impertinent attentions. In this assertion of independence she is now including even Japan, which appeared for a time to be regarded as a near relative rather than an alien. With all nations she is apparently trying to go just as far as the tether will permit; but she realizes better than in former times that the tether still holds. Her efforts to remove it are now rather of the nature of continued rubbing than of snapping, and at the same time she is endeavoring, in manners at least, to prove herself worthy of liberty.

Naturally, one of the events which has drawn closest attention during the past few months has been the return of the Imperial Traveling Commissioners, fairly bursting with the things which they had seen in the various countries visited, gratified by the attentions showed them everywhere, more than ever convinced that revolutionary transformations must be the order of the day in China, and with their observations and recommendations voluminously recorded for the perusal of the Emperor and the Empress Dowager. These matters have been reported so much in detail in the American papers and magazines that I shall not attempt to rehearse them. Three or four stand out in decided prominence, and are worthy of emphasis as forming the basis of most of the interesting developments of the past few months. One of the most suggestive, if not the most important, is the proposed change of costume, the doing away with the queue and the adoption of the European and American style of dress, now so largely prevalent also in Japan. Perhaps the most radical of the commissioners, Duke Tsai Tse, is said to have declared to their Majesties, at a private audience, "hampered as we are in our present style of dress, and with our queues, these things militate against an energetic life, and we will, therefore, never have the enterprise to keep our country on a par with Western countries so long as we keep to our present clothes and hair." The Duke, I think, expressed the increasing conviction of the people, at least those who have come at all into contact with Westerners. I have talked with many on the subject of the queue, and have yet to find one man in favor of its retention. It is pronounced both filthy and embarrassing. Thousands, in various parts of the empire, have not waited for an imperial edict, but have followed the example set by certain grades of soldiers, and cut off their queues. Such progressives are not the object of ridicule and scorn, as they once were but the great majority of the people prefer to await imperial sanction before taking the step. When taken, it is almost always accompanied also by the adoption of Western clothing, the advantages of which may, in some respects, be questionable. But the Government is not ready yet for this change, being strongly dissuaded therefrom by certain high officials on the plea of peril to the dynasty from such a change. The change is bound to come, however, and I shall be surprised if many queues remain by the end of 1910.

Exceedingly important recommendations were made in the direction of education. Their exact nature, as well as those with reference to other matters, is not likely to be known until the reports of the commissioners have been thoroly canvassed by the honorable commission, headed by Prince Chun, and comprising the presidents of the several boards and a number of Viceroys appointed by their Majesties to digest these reports and formulate definite policies for the Imperial consideration. But we know enough to appreciate the influence of the

commissioners in the ever-enlarging scope of the new educational system. Peking streets are witnessing ever-increasing throngs of neatly uniformed schoolboys of all ages, passing to and fro at certain hours, as in America, their costume showing a decided tendency toward the foreign pattern. The city now contains many schools for girls, confined almost exclusively at present to the noble and the wealthy, but bound to expand in their scope. Viceroy Tuan Fang, one of the commissioners, has been spending some time in Peking, has visited these schools, and everywhere most enthusiastically described and commended the women's colleges of America, which he visited. These schools began securing their teachers from Japan, the Chinese girls and women actually learning the Japanese language in order to communicate with their instructors; but the growing inclusion of Japan among "Western nations" has led the projectors of these schools to make diligent search for educated Chinese women, regardless of the fact that practically all of this class available are Christians. The result has been the invitation of one after another of our Christian women to take charge of these schools, the salaries offered being so much higher than any the missions are able to pay, that the wife of a man who earns about eight dollars a month for working all day, may draw twenty to thirty dollars a month for working three hours per day. This naturally introduces one more perplexing problem into missionary, as well as domestic, economy.

But the course of progress in education, like another proverbial course "does not always run smooth." In a small city in Kuangsi province, a school was built in foreign style, and its one hundred students dressed in the semi-foreign white uniforms. Some time ago, rain being badly needed, the country people went to this city to pray for rain. In that region it is thought most unpropitious for such suppliants to encounter any one clad in white, or wearing a hat. This procession passed by the school, and the boys came out in their white suits and straw hats. Angry murmurs culminated in a violent attack on the students and their school. Some were beaten, and all who were caught had their white suits torn from their backs. The magistrate who interfered was also roughly handled, and the trouble was only quieted on the arrival of a considerable number of soldiers. Ancient superstition does not readily assimilate new customs.

Whatever may be the advantages, China is certainly doing herself great injury by her attempt to make all these great changes, and inaugurate a complete new system of education, almost without foreign assistance. The rejection and dismissal of that assistance have come altogether too soon, for the number of Chinese thoroly qualified, by education in China, in Japan, or in Europe or America, for the charge of this new kind of schools, even in the lower grades, is totally inadequate. Men are being put in charge who know little of the text books and still less of modern methods of teaching, with the result that many of the schools are an utter farce. The desire to accomplish everything at once, in the way of modernizing methods, has now taken stronger hold on the Government and people than it had on the Emperor and a few of his advisers in the summer of 1898; and, having coupled with it the general demand that it shall all be done by the Chinese, the consequences are likely to be still more discontent—not so "divine," perhaps. Foreign organizers, and a considerable number of foreign teachers, with the establishment of thoro-going normal schools in each province, would do more in the next ten years to prepare the Chinese for self-government, and for the conduct of their own educational institutions than they are likely to accomplish with the present plans in forty years. But in this respect the Chinese do not seem to have the shrewdness and foresight of the Japanese; or, perhaps, they may be said to have had their heads turned by the sight of what the Japanese are now able to do, and are trying to leap at a bound to the position to which Japan has climbed by the aid of cleverly assimilated foreign assistance.

In this connection, and enforcing the necessity of making haste slowly, that it may be wisely, we may note the most startling, interesting and important of all the suggestions of the Traveling Com-

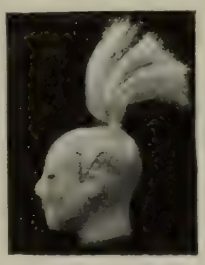
missioners, that looking to the adoption of a constitution, and the establishment of a Parliament, for the Empire. To the surprise of every one, their Majesties took to the idea most kindly, and immediately issued the decree which has attracted the attention of the world, a decree far more radical than any of those for promulgating which the Emperor was turned down eight years ago. First declaring the active interest of the throne in everything likely to prove advantageous to the people, and recalling the purpose of the despatch of commissioners to study the nations of the world in their interrelations, their Majesties report the unanimous opinion of these commissioners that the main cause of the backward condition of China is due to the lack of confidence between the highest and lowest, between the Throne and Ministers and the masses. "Foreign countries really become wealthy and powerful by granting a Constitution to the masses and allowing universal suffrage. Thus Sovereign and people are interlaced as to their common interests, and what affects the one will surely also affect the other. As for ourselves, it is necessary at present to make a careful investigation into the matter, and prepare ourselves to imitate this government by constitution, in which the supreme control must be in the hands of the Throne, while the interests of the masses shall be entrusted to the elect, advanced to such position by the suffrages of the masses. This, it is to be hoped, will be the means of strengthening the foundations of an everlasting Empire. But at this time of the day no method of procedure has as yet been drawn up, whilst the understanding of the masses is very limited. Any impetuosity shown in introducing these reforms will, at the end, be so much labor lost. How can we then face our subjects under such circumstances, and how regain their confidence and faith in us? It is incumbent upon us as a beginning, therefore, to reform the official system, next to revise carefully the laws in their minutest details, promote and encourage universal education, regulate the finances and sources of revenues, reorganize the army and establish a strong gendarmerie thruout the Empire. The gentry and people will then understand the kind of Government needed for the country, and be prepared to start the foundations of a Constitutional Government, whilst the officials, high and low, in Peking and elsewhere, will use their best endeavors to bring our desires to a triumphant completion. In a few years' time, when it be found that there is a rough outline of what is needed, then will the time come for appointing a day for the inauguration *de facto* of a Constitutional Government. The whole Empire will then be notified of the fact. We would, therefore, earnestly exhort our Viceroys and Governors of Provinces to issue proclamations to their people, to show an enthusiastic desire for education, to be loyal and patriotic, to sacrifice for the good of all, and to refrain from destroying a grand structure thru petty strife and private quarrels. Let all observe law and order, and prepare themselves to enjoy the solid advantages of a Constitutional Government. This is our sincere hope and desire. Let this be made known to the whole Empire."

As is well known, it was not many days before the Imperial Government so modified its promises in the direction of a Constitution as to caution the people against hoping for any immediate establishment of such an innovation, while not modifying in the least its declaration of the new principle as one to the soundness of which their Majesties had given full allegiance. Many have expressed great disappointment at this, and have declared the original edict a mere sop to the people, with no sincerity in its promulgation and no probability of its fulfilment. It is, on the other hand, to be noted that the nation most nearly akin to the Chinese has not had its enthusiastic reception of the edict, or its sanguine expectations of its fulfilment, wet-blanketed by the later cautionary statements. The style of Constitution suggested by the Commissioners was that of Japan; and Japan still believes that China is in earnest in her determination to make the change at the earliest feasible date, in order to place herself in line with all the progressive nations of the world. Moreover, the Chinese people, who understand the tortuosity of their own Government perhaps better than any outsiders, have heralded the original decree with the utmost de-

gree of enthusiasm, and are accepting the later modifications in the spirit in which I incline to think they were issued. In all parts of the empire great celebrations of the event have taken place, and on all hands it is becoming evident that no other event of recent years has done so much in so short a time to cement the national unity, and at the same time stimulate every sort of reform and progress. It will be noted that the modifications of the original edict were simply declarations that the establishment of a Constitutional Government must await the more general education of the people. This is nothing more than the emphasizing of the last sentences of the edict itself, the necessity for which is evident to any one at all intimately acquainted with the masses of the Chinese people. While it may be said that universal suffrage is, in itself, educative, yet even democratic America would hesitate to put the ballot into the hands of hundreds of millions of people who not only neither read nor write, but who know absolutely nothing of the world outside of their own country. A Constitution and a Parliament, with a distinct educational qualification to the suffrage, might answer at the present time; but it is a question whether the stimulus to education thus afforded would be as powerful as that now provided in the promise of these privileges after a good beginning is made in this direction. The stimulus is now to every man, learned or unlearned, rich or poor, to secure as soon as possible a general system of education available for all; whereas the selfishness of the privileged educated classes might, in the other case, lead them to postpone as long as possible the qualifying of the present illiterate classes for the suffrage. In connection with the celebrations in various parts of the country, many speeches have been made exhorting those who can read to press the study of international and constitutional law, and urging the illiterate to seek an education, that, at the earliest possible moment, the people may demonstrate to their gracious rulers their worthiness of the great privilege just promised them. Their Excellencies Yuan Shih Kai, Tuan Fang and Chang Chih Tung, Viceroys of Chihli, Hukuang and Liangchiang, respectively, have decided conjointly to memorialize the Throne to issue an Imperial decree making the education of children in the Empire compulsory, on the lines pursued in the United States, the power of enforcement to be in the hands of the newly created Commissioners of Education in each province. As a further preparation of the people for the great changes proposed, the first two of the above Viceroys have given instruction for the compiling of a number of the reports of the Traveling Commissioners, with reference to Constitutional Governments in Europe and America, for distribution to the people of all the provinces, that they may understand what Constitutional Government means. A million copies are to be printed, and, in addition, all Chinese newspapers are invited to print these reports, so as to give them as wide a circulation as possible.

It is needless to say that the changes in officialdom proposed by the Commissioners and by their Majesties are greatly needed; but it is hoped that they will go much farther than the mere readjustment of ranks and titles. One very important proposal is the elevation of the rank of military officials to a par with that of civil officials of the same grades. Until this is done the old contempt for the military class, once so well deserved, but now—at least in some provinces—so well lived down, will continue to some extent. It is greatly to be hoped also that this elevation of rank will be accompanied by an increase of pay, both for officials and men, as the latter particularly, in spite of their vastly improved appearance in their new uniforms, find it almost as difficult as in the olden days to make both ends meet—perhaps more difficult, as they have now less opportunity to obtain money in illegitimate ways. But other changes are even more pressing. Their Majesties have recently received a most earnest memorial from Duke Tsai-Tse, strongly condemning the indolence, indifference and selfishness of most of the high officials of the Empire. He says that the people are ready and eager for reform, but so long as their officials manifest their usual selfish indifference there is no one to encourage the people to seek to better themselves. Consequently China stands on the edge of a precipice.

The Duke particularly denounces the anti-reform clique, who are opposing the Constitution and Parliament, pronouncing them traitors working for the destruction of their country. It is reported that the Emperor in particular was much moved by this eloquent and patriotic appeal.



Many a time have the advocates of one of the most pressing reforms shaken their heads in sadness at the apparently small results of their efforts. Those who have longed to free China from the fearful curse of opium have had to contend not only with the vested interests of this empire, but also with the still more powerful and still more pitiless interests of a mightier empire on which the sun never sets. Great Britain, reluctant to lose the millions of revenue for the sake of millions of human souls, constantly threw the burden of responsibility for the continued traffic on China, while China retorted her inability to move without the consent of Great Britain. But the evil has assumed such frightful proportions within the past few years, and such strenuous representations have been made in England that that great Christian land has at length been shamed into a proof of her Christianity, and has declared herself ready to do her part toward killing the monster. Just at this, the "psychical moment," Viceroy Chou Fu, then of Minchê, offered to the Rev. Dr. Dubose, of Suchow, to present to the Throne a memorial on the subject, to be prepared by the missionaries in China. The memorial was prepared; 1,200 signatures, from seventeen provinces, were promptly secured, and the great petition was sent up to their Majesties. With almost startling promptness, on the 20th of September, there came forth from the Palace an edict, framed almost in the language of the memorial, saying: "Since the Imperial prohibition of opium (many years ago) almost the whole of China has been flooded with the poison. Smokers of opium have wasted their time, neglected their employment, spoiled their constitutions and ruined their households; and thus, for some decades, China has presented a picture of ever-increasing poverty and weakness. It rouses our deep indignation even to speak of the matter. The Court is now ardently determined to make China powerful, and it is incumbent upon us to urge the people on to reformation in this respect, that they may realize the evil, pluck out this deep-seated cancer, and follow the ways of health and harmony. We therefore decree that, within the limit of ten years, this harmful 'foreign muck' be fully and entirely cleansed away. And we further command the Council of State Affairs to consider means for the strict prohibition both of opium smoking and of poppy growing, and report their deliberations to us for approval." Of course the time limit is to avoid undue hardship, first, to the users of the drug, who could not break off suddenly, and, second, to those who have capital invested in the business. But the enforcement of this edict will mean simply untold blessing to this land and hasten her transformation in other ways immeasurably.

We were somewhat alarmed, the other day, by the report that all the newspaper reading-rooms in the city had been closed, and that one of the chief vernacular papers had been suspended and its editor taken to prison. At first it bore the appearance of a reactionary movement but it soon transpired that it was a Government movement in self-defense. There have been rumors for some days that Sun Yat Sen, the revolutionary leader from South China, was in the city; and it became evident to the Government that the paper mentioned, and many of the supporters of these reading-rooms, were making use of their opportunities to disseminate seditious ideas among the people; hence the sudden stroke. The editors of the paper have since been banished, and the police are very much on the alert to guard against any anarchistic or anti-dynastic movements. Native secret societies have been greatly on the increase in some of the provinces, but are being rigidly suppressed by the provincial authorities.

There has been a slight recrudescence of Boxerism in Shansi, quickly nipped in bud by a German officer, who offered his services to the frightened magistrates. Leading a little company of Chinese soldiers to the Boxer temple, and surrender being refused, he killed eleven of the

Boxers, wounded many, and took forty-two prisoners. Everything is now peaceful.

Even the language is not proof against the spirit of reform in these days. A cry has bone up from all over the Empire for the unifying of the spoken language by the dropping of the local dialects in favor of the mandarin, even the various forms of that language to be reduced to one; and the students in the new schools as well as many others, are pleading for the abolition of the literary language, the Wenli, altogether, even in text-books and essays, leaving it only in the classics and the books and records of the past, as a monument to the old principle that the finest scholar is he who can most successfully conceal his thought in his words. Even the old monosyllable characters seem doomed. The new alphabet of sixty-two signs has received Imperial sanction, and is being widely taught.

As Dr. W. A. P. Martin has recently pointed out, in an article on "Some Unmentioned Reforms," in the *North China Daily News,* there are some things yet to be desired; but when once a "divine discontent" secures such a start as it has already secured here, even these other things are bound to come. With the rolling away of the clouds of superstition, the evil customs which have thriven in the damp and the dark, are sure to pass with them; and the emissaries of the Gospel, and their friends in the home lands, may well be encouraged by such success as that attained in the anti-opium crusade, to hope that China is yet to become a Christian land.

PEKING, CHINA.

The Difficulty of Understanding the Old Testament

BY THE REV. JOHN M. THOMAS

[This subject is of particular interest now that our Sunday Schools are studying the Old Testament. Mr. Thomas is a ripe scholar and pastor of a Presbyterian Church.—EDITOR.]

AN unconventional brother once enlivened our Church prayer meeting with the truthful observation that if an ordinary Christian found himself in a comfortable Pullman stalled on a Western prairie, with reading facilities limited to a last year's almanac, a Hoboken directory, and a copy of the Bible, he would first exhaust the almanac, next extract all possible interest from the directory, and lastly, if the delay were long enough, turn to the Bible. It is on record that a certain African had persistence enough to read the Scriptures in a jolting chariot on the wretched highway from Jerusalem to Gaza, but from the attention the matter attracted it is evident that such conduct was as unusual in antiquity as manifestation of like zeal would be today. The Ethiopian, however, found the book somewhat hard to understand, and in that respect his experience is duplicated all too often in our own times. With something like 300,000 sermons on biblical texts preached every week in the churches of the United States, with over a million people teaching Sunday school classes, with books and pamphlets by the thousand on all phases of Bible study, it remains a fact that only the few have more than the most general knowledge of the Bible, while the great majority even of well-informed people feel that their knowledge of Scripture is sadly deficient. No subject is taught so much and understood so little. If a tithe of the pains which is now expended in endeavors to imbue American youth with a knowledge of Scripture were taken to obsess their minds with the dramas of Shakespeare, ignorance of the trap in which Shylock was caught would be hard to find. Yet who does not know

that references to like prominent events in biblical story are met with looks of questioning wonder, even on the faces of educated persons?

All interesting and intelligible books are perused today with great avidity. If the Bible is not read, and if large numbers are ignorant concerning it, the reason must be that it is not found interesting, and it is safe to add that the reason the book does not incite interest is because it is not understood. I received a confession the other day, deponent witnessing about as follows: "I made up my mind I was neglecting the study of the Bible, and I resolved to study it seriously; I happened to open up the book to Jeremiah, and feeling that there was unexplored territory, which might offer something new and agreeable, I began to read; but I was disappointed greatly; I could not see what it was all about, and I soon gave up the effort."

This confession declares the situation of many persons, especially in relation to the Old Testament. They do not read because they are not interested, and they are not interested because they do not understand.

Now why should it be difficult for any person of ordinary intelligence to understand the Old Testament? Certainly not for the same reason that it is hard to follow Kant's "Critique of the Pure Reason" or Mr. Balfour's "Foundations of Belief." The Old Testament is not philosophical; its thought is not abstruse, its conceptions are not abstract, its style is not involved. There is not a sentence in Jeremiah which is beyond the grasp of an ordinary mind because of the depth or difficulty of the idea which it contains. If any verse of the book is unintelligible, it is not because what the prophet would say is beyond ordinary comprehension, but because the reader does not comprehend what the prophet is trying to say.

For example, one reads that Jeremiah said: "I see a boiling caldron, and the face thereof is from the north." Every one can picture to himself a seething pot with spout pointing away from the north, and the image is readily called forth by the prophet's language, but what he means by it is not clear, and is not made clear by his explanation, "out of the north shall evil break forth upon all the inhabitants of the land." Why this evil? Why from the north? Why such uncanny imagery? It is not very easy even for the studious reader to find an answer. Yet until one enters by sympathy into the life of Jeremiah's day, and feels with him the terrible army of the Babylonians and their resistless march southward toward Jerusalem, it is as idle to think to understand his words as it would be to endeavor to extract meaning from Lincoln's second inaugural if one did not know that America was ever engaged in a civil war.

Doubtless the dedicatory address at Gettysburg to one as far away from the events of 1861-65 as the men of today are removed from the equally portentous times of Jeremiah would be as sounding brass or a tinkling cymbal. But given like knowledge of the Hebrew patriot, and his words will be not less eloquent, not less pathetic, not less inspired, than the words of the modern martyr. Indeed when you know them there is a strange likeness between these two—lonely men, pathetic men, sensitive men appointed unto marked publicity, tenderhearted men obligated to awful deeds.

The obscurity of Jeremiah, owing to the difficulty of arriving at a clear understanding of the situation to which he addressed himself, is a fair example of the obstacles one meets on almost every page of the Old Testament. There are gems of utterance, like the Gettysburg address, but no explanation of the occasion on which they were delivered. There are orations on public policy, whose elevation one cannot mistake, and from whose moral fervor the soul catches fire, yet their full force is missed because sometimes their parts are disconnected, while irrelevant and neutralizing sections are thrown in, and the orderly thought of the whole and the goal the speaker had in mind are not brought into the clear. The mighty men of the Old Testament were prophets, and they were the makers of Israel's religion, but their works have come down to us in such fragmentary manner, with such frequent breaches of chronological sequence, that the ordinary reader is bewildered and confused, and no clear conception of the prophet's work results. The consequence is that the only popular use of the most

essential books of the Old Testament is to furnish a few texts by which it is thought to establish the fulfilment of prediction, an argument for faith which is weak in itself, and becomes weaker the more one studies it, and which has the disastrous consequence of blinding its devotees to the true historical meaning of the texts which it thus perverts.

If the statement that the prophetical writings are fragmentary, interpolated and without chronological sequence smacks too much of subjective criticism, the difficulty of deriving from them any idea of the orderly growth of Israel's piety may be substantiated as forcibly from the order in which book follows book. Taking the minor prophets, one goes from Hosea, a teacher in the great days of Jeroboam II of Israel, to Joel, who was one of the last of the prophets, and who quotes from many of them; thence back to Amos, who was the first of all, preceding even Isaiah; thence to Obadiah, who had somewhat to say concerning Edom in the days of the exile; thence to Jonah, who was not a prophet at all, but a literary artist of the first magnitude and a teacher of toleration and of the equal Father of all men in the late times of Israel's bigotry; thence to Micah, a younger contemporary of Isaiah; and thus from Isaiah to Malachi the reader is snatched hither and yon, dragged forward and backward over centuries, and confronted with situations the most diverse. It is instructive to note the dates of the several prophets, major and minor, as their books stand in the Bible, taking in each case the earliest probable date of the predominant portion of the prophecy. Beginning with Isaiah, the years before Christ are as follows: 740, 626, 592, 168, 745, 400, 760, 450, 450, 700, 650, 600, 630, 520, 520, 540. It is patent that from a book thus put together it is impossible for the general reader to derive anything like a consistent picture of the relation of mind to mind and of the development of religious truth and practice.

The suggestion is near at hand that since many of the prophetical writings are equipped with a brief introduction relating them to times of particular kings, one has but to turn to the historical books and secure from thence the necessary background for the knowledge of the prophets. It might seem providential that the Old Testament offers both the original documents of its growing truth in the form of prophetic discourses, and also historical summaries of the problems and events of each corresponding period. One has not to proceed far on this theory before discovering that the books of Kings and Chronicles are utterly disappointing if one seeks to gain from them any real knowledge of the situations to which the makers of Israel's faith applied themselves. To be sure, the historians have preserved a large number of important facts without which our knowledge would be far smaller than it is, but as guide-posts on the way to correct appreciation of the means and the steps by which Israel traveled her long road upward toward her worthiest faith these books of history are altogether misleading. It is not too much to say that Israel's historians have prevented true understanding of their nation's greatness in the case of countless thousands. With their monotonous comment on the "sin of Jeroboam, the son of Nebat, wherewith he made Israel to sin," they have estimated each generation for over 200 years according to its devotion to one particular sanctuary, condemning each king who did not worship at the prescribed altar and according to the proper ritual. Such a history no more gives a faithful account of the real condition of things in Israel than would a similar account of the history of New York City since the days of Peter Stuyvesant, which made chiefly prominent the sort of ritual practiced in Trinity Church, and the measure of adherence to it on the part of the various Mayors. The hopelessness of deriving a sufficient conception of the character of Israel's kings, the true nature of their piety, and the progress of their people toward nobler life and worthier ideas of God, from a history of this character must be evident to all.

The Old Testament as it stands today is dominated by the priestly notions which prevailed in the time of Israel's decay, two centuries after the ages of its strongest life and its clearest vision of the things of God. In the year 458 B. C. Ezra the scribe came from Babylonia to

Palestine, and brought with him the law of God. A reformation was enacted in Jerusalem, in accordance with its terms, and from the character of this reformation and the dependence of the law upon Ezekiel, it can be shown that the code for which Ezra the scribe was so zealous had been composed not long before in Babylon. This is the code which shows least the influence of the prophets, which is monotonously tiresome in ritualistic prescriptions, which makes religion a matter of altar measurements and curtain hangings, and which teaches by certain implication that to sacrifice is better than to obey, and that the sacrifices of God are not a broken and a contrite heart, but the blood of bulls and of goats. Leviticus is simply the priestcraft against which Amos and Isaiah hurled invective, transformed into law, and entitled with the name of Moses.

Yet it is precisely this legal and priestly portion of the Old Testament which constitutes its framework, which has fixt its chronology, which has thrust its general scheme of the history of the Hebrews and the origin and growth of their religion into general acceptance and belief. The popular notion of the Old Testament is the priestly notion, which Amos would have resisted as strenuously as he opposed Amaziah, the priest of Bethel, and which is as far below the noblest piety of Israel as II Peter is below the Gospel of St. John. It is due to the code which Ezra brought from Babylon that we think of Israel in the desert as a great Church on a pilgrimage, with a shrine outrivaling in splendor the tomb of a medieval saint, and a system of worship more complex and costly than the most elaborate Roman ritual. It is this priestly document which has supplied Christian defenders of the faith with the hopeless task of finding moral justification for the slaughter of the Canaanites, for only in the later writings are they exterminated; in the earlier accounts Hebrews and Canaanites live on together in the same land many years. After the teaching of the priests of Israel we conceive that sacrifices and offerings were the most important matters God had to convey to his children for well nigh two thousand years, and we naïvely suppose that this elaborate system of ritual and ceremony, with the entire moral law, sprang into existence almost in a day at the beginning of the national life. Thus it has been impossible to conceive of any development of Old Testament religion, since according to the theory the whole was present at the beginning, and succeeding generations had no need to struggle their way up into the truth, but merely to obey a law which had come down from Heaven.

Herein lies the chief difficulty of understanding the Old Testament. It is not the largeness of the book, nor the remoteness of its life, nor the oriental character of its imagery, nor the obscurity of its ideas. It is unintelligible, and therefore uninteresting, because one can not follow the development of its thought and its religious conceptions. Its first rude beginnings of belief in God and crude endeavors to do His will are hidden in fragmentary narratives in Judges and Samuel and in portions of the Pentateuch. Its early days of strength and its magnificent rise to spiritual religion are covered up in the obscure and difficult orations of the prophets. But in the times of its decay, when the prophet had given way to the priest, the records of its rise were taken in hand by small-minded men who judged all things by the petty ritualistic standards of their time, and thus the priestly stamp was impressed upon the whole.

The way to an understanding of the Old Testament lies thru criticism. The Old Testament will ever remain an enigma and a riddle until it is understood as a growth. It will hold men back from their best estate in piety and morals so long as they yield it homage as alike the word of God in every part. The common man must be taught to discern between the diverse sorts of religious documents, which vary in historical trustworthiness, and mislead often as to their origin and their true position in the growth of piety. The criticism which is now the exercise of the schools must become the practice of the private student, who turns to the Bible for moral encouragement and religious illumination. The Church must teach the Old Testament as the critics interpret it, if her more progressive members are to preserve their regard for Scripture. The modern man

understands only that in which he can trace cause and effect, and knows history and biography only as progress and development. Without criticism no history of Old Testament faith is possible, and wide-spread, popular interest in the Scriptures, which above others were written for our learning, waits for fearless and earnest presentation, from the pulpit as well as from the lecturer's chair, of the methods and principles by which knowledge of the growth of Israel's faith has been attained. Critical use of the Old Testament alone makes it intelligible, spares one the harm which results from promiscuous adoption of its precepts, and renders possible the benefit which is theirs who work their way close to the creators of the world's highest religious truths.

EAST ORANGE, N. J

The Obedience of the Peoples

(The Second Peace Conference)

BY GEORGE BENSON HEWETSON

LORD of Hosts, the undivided,
Of all men the living Lord,
In the thrall of hate and mammon
Live the peoples by the sword.
On man's cleavage into nations
Let Thy healing be outpoured.

Sick of Moloch's hoary altar.
And the blood to Moloch shed,
Turn they from his monstrous orgies,
Meek of heart, and bowed of head,
Pleading, "Lord of all, have mercy
On the living and the dead.

"From the path of Thy uprightness
Our rebellious feet have strayed;
And we suffer from the idols
Our unruly wills have made;
Grant to us, Thy contrite peoples,
Thy great peace, so long delayed."

Vast with calming benediction,
Thru their hearts there runs a thrill,
Not of earthquake, fire, or whirlwind,
But of voice, which, small and still,
Whispers, "Man's abiding conquest
Is to do God's saving will."

"Peace on earth," so sang Thy angels,
Yet on earth the peoples bleed;
"Not the least of these should perish,"
From of old Thou hast decreed.
Not of Thee the murderous conflict,
But of man's gainsaying deed.

And as war's high-sounding trumpet
Brings the valiant to the field,
So to Thy constraining summons,
Long chastised, the peoples yield,
That the enmity of nations
May forevermore be healed.

For this hour they long have waited,
Struggled on thru smile and frown,
Faced the fierce award of battle,
Laid their lives in conflict down,
Hoping that some future blessing
Would their sacrifices crown.

As before Thee they assemble,
Grant the coming of the time
When the mingling of the peoples,
Gathered in from every clime,
Shall result in one vast nation
To subserve Thy deeds sublime.

Let no word of doubt or anger
Fall from lips supremely blest
With the message of a people,
North, or South, or East, or West,
That would wound the most defenceless,
And estrange from all the rest.

Give to each the prophet vision,
That large heart which can divine,
In the chaos of the ages,
Thy omnipotent design
To produce from earth's confusion
That vast age which shall be Thine.

God of Mercy, on the nations
Let Thy pity be outpoured,
In the hearts of all the peoples
Be that love of Thee restored
Which shall fuse them into oneness,
A great people for the Lord.

SEATOR-DELAVAL, ENGLAND.

The Income Tax in France

BY JULES SIEGFRIED

[The author of the following article is a successful Havre merchant, who has long represented that important city in the French Parliament, either as Senator or Deputy. He was Minister of Commerce at the time of the Chicago exhibition, and did much to have France properly represented on the shores of Lake Michigan. He has several times visited the United States, and has made the personal acquaintance of many of our leading public men. In view of President Roosevelt's desire for an income tax in the United States, and his late speech on the subject, France's experiences are of much contemporaneous interest.—EDITOR.]

OF all the sources that feed the budget of the modern state, a direct tax is assuredly the most justifiable, and its most natural form is unquestionably the income tax. What, in fact, can be more legitimate than to require of each citizen a contribution to the country's expenses in accord with his real financial condition? This so very simple form of taxation, the first that occurs to the mind, was also the first that existed in France under the ancient régime, the chief resource of the treasury in those days being the *taille*, a tax levied in accordance with the supposed income of each taxpayer.

This system was abolished by the Revolution, as it had given rise to many abuses; for, tho nothing is fairer than requiring each citizen to aid the state in proportion to his real wealth, nothing is more difficult than to fix exactly and equitably what this income is. Condorcet said, in 1791, referring to the vexations of all sorts which finally vitiated the collection of the *taille:*

"You all remember, villagers, how you deprived yourselves of the simplest pleasures, knowing that a clean coat, a more commodious piece of furniture, would affect the amount of your tax."

In some parts of the country an effort was made to substitute for the *taille personnelle*, which has just been described, the *taille réelle*, that is to say, a direct tax on things, without trying any longer to find out the total personal resources of each subject of the king. The result of this trial was excellent, and it was on this experience that the legislators of the revolutionary period based their fiscal reforms. The Constituent Assembly, dominated by the idea, which is false, however, that all riches come from land, suppressed all the taxes then existing and established, in 1790, the *contribution foncière*, a direct tax on the average income from all landed property. It was originally intended that this should be the only tax, but the need of more money soon required the establishment of the *contribution mobilière*, or a tax on personal property; and in this same year was created the *patentes*, or license tax. The Assembly considered this tax as replacing the indirect taxes which had been suppressed, but the increasing need of money necessitated the re-establishment of this excise revenue, which has become more and more one of the most important elements of the French system of taxation. Thus, the old idea of the *taille*, that is a tax on revenue, continued to characterize all these new efforts to raise money for the state, and a resolute move was made in the direction of the determination of what a tax should be, based on indications furnished by outward signs. Tho an effort was made to find out what was the real income of the taxpayer, no attempt was made to establish the exact sum. A tax was laid on land, buildings, rents, callings, etc., whose value is closely related with the actual riches of every one. This is the system which still prevails in France, tho it has often been modified in detail. It is at bottom an income tax.

Alongside of the earlier taxes have grown several additional ones, which now affect almost every form of individual riches. Thus "the sumptuary taxes" of the Revolution, which were suppressed by the First Empire, have been revived under the form of a tax on carriages, horses and mules, and a tax on billiard tables, which tendency was nearly still

further accentuated this year by a piano and organ tax, the proposal having passed the Chamber of Deputies, to be thrown out by the Senate. Stock Exchange operations are taxed; contracts and various commercial operations are reached by registration fees and stamp duties, and the list would be a long one that would give all the various ways in which the state secures an increase of its funds in this field.

To obtain an idea of the whole burden which rests on the French taxpayer, we need simply glance for a moment at the budget of the present year, where we will find that the total reaches the respectable sum of 3,832,305,648 francs, of which 3,496,001,731 francs have to be paid directly by the thirty-nine millions of Frenchmen. When a system of taxation brings into the State Treasury, without fail or protest, such a large sum, it

JULES SIEGFRIED.

may be affirmed *a priori* that no source of riches is overlooked and that in its working no grave injustice is done. However, there is a continual and earnest demand in France for a reform of direct taxation and the substitution for it of a tax on income, which would be more simple and more equitable. The criticisms brought against the present system may be classed under two heads. One has to do with the mode of assessment and collection. Thus, the tax based on rental falls heaviest on large families, which must have a larger apartment or house than a small family; so this affects the birth rate of the country, which is already too low. Again, the window and door tax is objectionable for reasons of hygiene; it shuts out light and air from the houses. Nobody denies the truth of these and other defects of the present system, and its defenders reply that nothing is perfect, that a tax on things is always far less objectionable than a personal tax, and that it is not wise to upset an old and well-established system for a new one that the people know nothing about.

The second category of criticisms is of a theoretical nature and springs from the development of socialistic ideas in France. The socialists complain that our taxes are all proportional—that is, whatever may be the importance of the thing taxed, the *fisc* demands of the taxpayer the same fraction of the value of that thing. Thus, the landlord of a house which rents for 10,000 francs a year pays to the state 320 francs, and the owner of a house which rents for 100,000 francs pays 3,200. The advanced parties in France would substitute for the proportional the progressive system, when in the case of the two landlords just mentioned, the *fisc* would claim from the first the same 320 francs as today, but from the second 4,000 francs, and the rate would go on increasing with the increase of the income. The partisans of this system hold that "the superfluous should be taxed more heavily than the necessary." This is not the place to discuss the merits or the demerits of this theory. What is of practical importance is to know not simply whether the tax is to be progressive, but in what manner it is to be so. If the rate increases rapidly and without limit, in the end the wealthy would be despoiled. But if, on the contrary, there is a maximum and a decrease in the rate as the taxable income grows, then the proposed system would lighten the charge that weighs on the poor, which everybody is ready to accept, without being unjust to the rich.

This present bill in favor of an income tax is not the first that has been introduced into the French Parliament. Several projects of this sort have been presented during the present republic. Until recent years it was members who brought forward these measures, the Government not taking the initiative. But since 1892 the custom has changed, and bills due to the initiative of the Government have followed one another in rapid succession. This new departure is to be attributed to the growing strength of the radical party, both in Parliament and in the Cabinet. The establishment of an income tax has become a permanent plank in the radical platform. But as none of the bills just referred to have been passed, it is not necessary to examine them here, and I will now take up briefly the bill that is before Parliament, which is very original in many respects, and which is due to the present Minister of Finance, M. Caillaux. It is the widest attempt to reform our tax system that has so far been proposed, and is, in fact, an effort at a synthesis of what has been previously suggested.

M. Caillaux advocates the suppression of the four kinds of direct assessed taxes which now exist, as well as several other supplementary taxes, and offers in their stead an income tax of two kinds—one resembling the English income tax and a second which would be personal and general. This last is described in the bill as "a redressing tax," whose aim is to secure the progressive character of the tax. Thus, it will affect all of the revenues already reached by the first tax in this bill, provided this revenue is more than five thousand francs. There will be thirty-five categories; that from 5,000 to 5,500 francs will be taxed ten francs, while the tax will reach 3,550 francs for an income between 90,001 and 100,000 francs. When the income is over 100,000 francs, the tax will be uniformly 4 per cent.

This proposed bill is sure to awaken

violent criticism; in fact, such criticism is already awakened, especially as regards the new powers given to the Treasury Department to decide what the taxpayer's financial situation is. This power will be declared vexatious and inquisitorial. There will also be stout opposition to the clauses of the bill affecting the income from certain investments, which, if applied in all their details, will be an obstacle to commercial affairs and business in general. As regards the amount of money which the proposed system will bring into the state treasury, the difference between the new and the old is not great. Under the present system, the total is 690 millions of francs; under the proposed one, the total will rise to 694 millions.

The following table gives the number and amount of the incomes of French taxpayers, and will be found interesting in connection with this subject:

Income categories.	Number of incomes in each category.	Amount of the income in each category.
2,500 francs and under	9,509,800	12,342,000,000
2,501 to 3,000 francs	563,000	1,597,000,000
3,001 to 5,000 "	446,000	1,735,000,000
5,001 to 10,000 "	294,000	2,109,000,000
10,001 to 20,000 "	123,000	1,798,000,000
20,001 to 50,000 "	51,000	1,673,000,000
50,001 to 100,000 "	9,800	974,000,000
100,001 and above	3,400	572,000,000
Totals	11,000,000	22,500,000,000

The above table shows how mistaken is the idea that a heavier taxing of the large fortunes will lessen the burden on the smaller incomes. It reveals also, and I close with this remark, on what a solid basis are established the riches of France, since these riches are composed of a multitude of small, private fortunes, of little importance when taken individually, but remarkable from their number and the high average which they show.

PARIS, FRANCE.

The American Drama Revisited

BY WILLIAM ARCHER, M.A.

[When Mr. Archer was in this country some weeks ago attending the Peace Conference and the meeting of the Simplified Spelling Board, he took a few nights off to see the plays of New York. As he is generally regarded as the foremost dramatic critic of England, the following article, which was written for the London *Tribune* and for THE INDEPENDENT, is of more than ordinary importance.—EDITOR.]

THE friendly rivalry between the United States and England is in nothing keener than in dramatic production. This rivalry is a comparatively new phenomenon. Ten years ago, it could scarcely be said to exist. The English stage was then in the full flush of that "Renaissance" celebrated by Mr. Henry Arthur Jones, which had set in about 1890, and had brought to the front such dramatists as Mr. Pinero, Mr. Jones himself, Mr. Carton and Mr. Haddon Chambers. Meantime the American stage had, in Mr. Bronson Howard, a dramatist of great expertness in French technical methods, and was developing a school of rural or hayseed drama, of which James A. Herne's "Shore Acres" and Denman Thompson's "Old Homestead" were the leading examples. But for the most part the American stage lived upon imported plays, French and English. It could not for a moment rival the English stage in original productivity.

That was ten years ago. Eight years ago, when I was last in America, this state of things was already beginning to alter. Young American playwrights of unmistakable talent, such as Mr. Clyde Fitch and Mr. Augustus Thomas, were coming into the field; and James A. Herne had produced in "Griffith Davenport" an American historical drama of very high quality. (I shall never cease to reproach the American critics and public with their failure to appreciate that truly remarkable work.) But at that time people still shook their heads over the future of the American drama. It was being throttled (so the story went) by the nefarious Syndicate, which looked only to Paris and London, and had no encouragement for rising native talent. That this complaint was in a measure just appears from the fact that in six weeks' assiduous theater-going, I saw no American play of real note save the aforesaid "Griffith Davenport." For the rest, I was chiefly inter-

ested in comparing the American with the English performance of current English plays—such as "Trelawny of the Wells," by Mr. Pinero; "The Liars," by Mr. Jones; "Lord and Lady Algy," by Mr. Carton; "The Idler," by Mr. Chambers. French plays, too, were much in evidence. New York was crowding to the meretricious hysterics of "Zaza," while "Cyrano de Bergerac," in the person of Mr. Richard Mansfield, was making a triumphant round of the other great cities.

So much for 1899. I return in 1907, and what do I find? Well, the first fact that stares me in the face is that the nefarious Syndicate has certainly not succeeded in throttling the American drama. I find eight or ten notable American plays running successfully on the New York stage and (musical pieces apart) no English production holding a prominent or lasting place in the bills. My first evening in New York was devoted to the last performance of Mr. Shaw's "Mrs. Warren's Profession"; and I might also have seen, had time permitted, performances of the same author's "Widower's Houses," and of "The Silver Box," by Mr. John Galsworthy. But none of these plays had been notably successful or had run long. Earlier in the season, indeed, two English plays, "The Hypocrites," by Mr. Jones, and "His House in Order," by Mr. Pinero, had met with considerable success; but neither of them had approached in popularity "The Lion and the Mouse," by Mr. Charles Klein; "The Three of Us," by Miss Rachel Crothers, or several other American productions. French plays, again—and this can scarcely have been a mere chance—were conspicuously absent from the advertisement columns. On the other hand the recent success of Mr. Mansfield in Ibsen's "Peer Gynt," and the remarkable popularity of Madame Nazimova's performances of "Hedda Gabler" and "A Doll's House," seemed to indicate in the New York public an alertness of receptivity which London certainly cannot boast. The vogue of Ibsen recalled the fact that Mr. Bernard Shaw met with appreciation in New York long before London would consent to take him seriously as a playwright.

The interesting situation here outlined I now propose to study in somewhat greater detail.

First, a few words as to material conditions. New York is, on the whole, I take it, a better field than London for theatrical enterprise. The habit of theater-going is more widely diffused. The main body of the theatrical public lives nearer to the region of the theaters, or, at any rate—thanks to the "Elevated," the electric cars and the Subway—can reach it more expeditiously and cheaper. The dearest seats are somewhat cheaper than in London, the cheapest seats somewhat dearer—which is probably, on the whole, an advantage. But the greatest advantage of all lies in the fact that the evening-dress habit is by no means so tyrannical and deterrent in New York as in London. The busy New Yorker does not feel bound to go home and dress before going to the play. If he has time to dress, good and well; if not—no matter. Nor do his womankind hold it necessary to dress (and undress) themselves as tho for a ball before they enjoy an evening's amusement at the theater. From the business point of view the beneficial effect of this common-sense treatment of the dress question is incalculable. How many thousands of people in London are driven to the music halls simply because they have not time or energy to dress for the theater! Yet I know of only one London manager—Mr. George Alexander—who has declared himself hostile to the evening-dress superstition.

That impermanence of American buildings which so distresses Mr. Henry James is clearly illustrated in the case of the New York theaters. Of those which I visited in 1899 few have survived the intervening eight years. Most of them have either vanished entirely or sunk into variety shows; while the constant uptown movement has brought into being a whole cluster of new theaters about the intersection of Broadway and Forty-second street. Eight years ago the theatrical region was fairly well lighted of an evening; but now the blaze of electricity which has earned for these streets the title of "The Great White Way," is, I believe, unparalleled in any other city.

But in one respect New York is distinctly, and rather alarmingly, behind London. We, too, in the past ten years, have built many theaters, and we have

built them with much greater regard to safety than is manifested in New York. I believe I am right in saying that our building regulations require that at least half of the peripheral line of a theater shall stand free from contact with any other building—which practically means that a theater cannot be built except on a corner site. As a matter of fact, many of our recent theaters stand free on three sides, if not on all four. Not so in New York. Here theaters are jammed together or sandwiched between other buildings, with what strikes me as extraordinary recklessness. Many of them have an absurdly narrow frontage, so that in order to reach the street the audience from all parts of the house have to converge in one wholly inadequate corridor or vestibule. This dangerous condition of things may in some cases be mitigated by iron emergency staircases outside the building; but for my part I should have little confidence in these appliances in case of a panic. The authorities seem to put pathetic trust in the system of numbering every doorway in the auditorium, "Exit 1," "Exit 2," and so forth up to "Exit 10" or even "Exit 20," and printing on each program a plan of the theater with these exits marked. But fancy an audience studying a little ill-printed plan with the smoke of a conflagration beginning to roll thru the house! Besides, a doorway is not in any valid sense an "exit" unless there be a corresponding opening, easily reached, in the outer wall of the building. A dozen "exits," all debouching ultimately into one narrow passage, are equivalent to just the width of that passage and no more. I sincerely trust that the measures taken to prevent an outbreak of fire are better than those for securing the safety of the audience should a conflagration, or a groundless panic, occur.

The immunity of America from the evening-dress superstition is much more significant than it might appear at first sight. The swallow-tail dominates the London stage no less than the London auditorium. To the British drama the white choker is a choker indeed. The dramatist cannot escape from the drawing-room, the boudoir and the conservatory. When he needs a breath of fresh air, he must be content to take it at a garden party. Sometimes, indeed, he may visit a country inn, but it must be in the society of an eloping Countess. On rare occasions he may indulge in an excursion to a Scotch moor in order to study its traditional fauna—to wit, dukes, millionaires and flunkies with luncheon baskets. Outside Great Britain only two places exist for him—Paris and Monte Carlo. He is fettered, in a word, to the West End of London. Even when he seems to wander from it, he but drags a lengthening chain. He may go wherever the West End of London goes; but elsewhere—at his peril! At the outset of his career, Mr. Pinero attempted, as he said, "to get the scent of hay across the footlights"; but this he soon abandoned.

The American dramatist suffers from no such petty restriction. The whole wide field of American life is open to him, and he is rapidly learning to make good use of his freedom. As people come to the theater in their workaday clothes, so they are willing to interest themselves in all aspects of the workaday world. There is probably a certain class—perhaps a large class—which still actively prefers the drama of dress coats and Paris gowns, such as our English playwrights turn out. In 1899 the manager of a huge stock company theater in Boston, which gave two performances a day and changed its bill every week, told me that his audiences, among whom women largely preponderated, were devoted admirers of the "shirt front play." No doubt this frame of mind still obtains to a certain extent. It is only too natural that people—and especially women—whose own lives are gray, laborious and sordid, should love to dwell in an imaginary world of light and luxury, purple and fine linen. That is the reason, I take it, why many of our English plays are still in request at cheap stock-company theaters, when their term of life in London or at the Broadway theaters is long over. But the American public, as a whole, has no exclusive affection for dukes and millionaires. It has a keen appreciation of character-study in all walks of life, of domestic sentiment, and of that "ethical" criticism which is at present so much in the air. The astonishing growth of politico-social interest and intelligence which is manifested in the popular 10-cent magazines, finds its reflex, faint, indeed, but unmis-

takable, in the theater. On the whole, then, I find the conditions of theatrical life much more free and healthy in America than in England. In point of individual endowment, our English playwrights have still the advantage. America has as yet no such master craftsman as Mr. Pinero, no such delicate dramatic humorist as Mr. Barrie, no such playwright-sophist as Mr. Bernard Shaw. But were I a young dramatist, ambitious of developing my genius freely, I would shake the dust of Britain from my feet, plunge into American life, and try to depict it for the American people. There are wider opportunities in New York than in London.

The American drama of today may be roughly classified under four heads. In the first place, we have plays of society, of New York and Newport, of gambling and divorce, very much like the drawing-room dramas of the English stage. Then we have what may be rather too pompously entitled sociological plays—plays, I mean, which are more or less directly concerned with economic and political problems. The third class consists of domestic dramas, depicting middle class life in town or country—"shirt sleeves" plays they have been not inaptly called. In the fourth class we may place such pieces as depend largely, and in some cases exclusively, upon external picturesqueness. They are dramas, for the most part, of frontier life in one or another of its phases.

Of the American social plays, one may say, in general terms, that they are written with somewhat less technical ability, and somewhat more intimate knowledge of the facts, than our English plays of the same type. The American playwrights who deal in this style of drama are much more genuinely at home in fashionable New York than are the British playwrights in fashionable London. They do not observe and report from an outside point of view, but are native and to the manner born. Mr. Clyde Fitch, the chief practitioner of the social play, always writes with his eye on the object. He knows intimately the characters and manners he is portraying. Unfortunately there still clings to him a certain artificiality, a fondness for startling scenic devices, which impairs the artistic value of his work. Such plays as "The Climbers" and "The Girl with the Green Eyes" are immensely clever, but they lack the solidity and sobriety of workmanship to which some of our English playwrights have attained. They strike one as brilliant improvisations rather than pieces of careful and conscientious dramatic architecture. One can, however, trace very clearly the growth of an artistic conscience in Mr. Fitch's work; and some day—some day soon, I have no doubt—it will arrive at maturity.

Lower middle-class life is regarded on the English stage as exclusively a subject for farce or melodrama. The domestic drama of the mid-Victorian period has entirely died out. It was poor stuff, sometimes founded on French originals, always, or almost always, inspired by conventional, Dickensish sentiment. But why, when the "renascence" came in the late eighties, should domestic drama, instead of putting on new life, have been suffered to pine away and die? Why should a whole wide and deep stratum of English life have ceased to find any serious interpretation on the stage? Mainly, I think, because the long-run system caused the managers to vie with each other in luxurious mounting; so that richly upholstered scenes, peopled by ladies in gorgeous frocks and frills, came to be regarded as essential to success. The managers' insistence on an upper-class environment led playwrights always to look upward in the social scale; and they soon had no eyes for the life of their own class or of that immediately below them. This has been a double-barrelled misfortune for the English drama. Upper-class life had been portrayed with insufficient knowledge, while middle-class life, and especially lower middle-class life, has not been portrayed at all.

The American stage, very naturally, has always been more democratic. It has never lost touch of rural life, of frontier life, of the low life of the cities. Even in the days of greatest depression, while imported drama from France and England was mainly in the ascendant, there was always an active production of domestic dramas, as a rule very unsophisticated in form, but with touches of genuine observation, and affording an opportunity for excellent character acting. James A. Herne was perhaps the

only laborer in the domestic field whose work had any artistic value; but such plays as "The Old Homestead," "The County Fair," and the Harrigan and Hart farces all exemplified the tendency of which I speak.

Now, as it seems to me, there are indications of the coming of a new school of domestic drama, not less faithful in observation, and a good deal more artistic in form. I have not seen any of the plays of Mr. George Ade, but I understand that they verge in the direction of farce. Nor have I seen Mr. Charles Klein's play, "The Music Master," in which that remarkable actor, Mr. David Warfield, has made such an enduring success. But I was fortunate enough to see in New York "The Three Of Us" and "The Chorus Lady," both dramas of very noteworthy ability and interest.

Perhaps I am perpetrating a libel by classification in placing first among the plays which rely upon picturesqueness for their attraction Mr. William Vaughn Moody's three-act drama, "The Great Divide." Many critics, and some good critics, would say that it ought to have a compartment to itself under the style and title of Psychological Drama. With the best will in the world, I cannot take that view. It is in some ways a remarkable play, but rather by external circumstance than by inherent merit. For a first attempt at drama it is remarkably successful; for a first attempt by a man of letters, with no special knowledge of the stage, it may almost be called unique. Mr. Vaughn Moody is, I understand, a professor of literature, and he is certainly a poet of much distinction. I know enough of his verse to esteem it very highly, and to feel the liveliest desire to know more. When a man of purely academic training, like Mr. Moody, is seized with the itch of dramatic authorship, his prentice piece is apt to be utterly feeble and amateurish, and very often he does not get beyond his prentice piece. Mr. Moody's play, on the other hand, is entirely competent and workmanlike. The instinct of the stage, it is clear, is strongly developed in him. Since "Lady Windermere's Fan," I can remember on the English-speaking stage no first play of so much practical validity. It is precisely in psychological interest, or perhaps I should rather say, in clearness of psychological development, that the drama seems to me somewhat deficient

Perhaps my expectations of "The Great Divide" were a little too high-strung. I had heard of it as the Great American Play, long looked-for, come at last. What I found was a strong sentimental drama, completely but rather heavily handled, written with vigor, but not without an occasional false note of literary "bombast." It is a hard thing to say, but, as I left the theater, vague reminiscences of Mr. Hall Caine floated in my mind. To lay any stress on the analogy would be to do Mr. Moody a grave injustice. I merely note, for what it is worth, the fact that this depressing association forced itself upon me.

In this survey, I have hastily reviewed a number of American plays which happened to come within my ken during a three weeks' stay in New York. But the mere enumeration of this little group of plays conveys but a faint idea of the extent to which, within the past ten years or so, the American stage has become self-supporting. The pieces mentioned have all been acted at leading theaters, by actors of prominence. They all hover on the confines of literature, and one or two of them come well within the boundary-line. But apart from these more or less conspicuous plays, there is a luxuriant undergrowth of native production, in the shape of farces, melodramas, musical extravaganzas, folk-plays of a more or less unsophisticated order, variety "sketches," adaptations of novels (for instance, of the famous "Jungle"), and romantic plays such as the popular "Road to Yesterday," in which two ladies have treated sentimentally the idea which Miss Harriet Jay handled farcically in "When Knights Were Bold." There are even signs of a mild efflorescence of poetic drama. Mr. Percy MacKaye, who has written several plays in verse, has had one of them, "Jeanne d'Arc," produced with success; and poetic plays by Mr. Ridgeley Torrence and Mr. H. W. Boynton are announced for early production.

But while America is more and more determined to write her own plays, and less and less inclined to rely on England or France for the staple of her dramatic fare, she is still much more hospitable than England to all sorts of exotic effort

in the field of drama. This fact is partly due, no doubt, to the great intermixture of races and nationalities in the American public; but I think it may also be traced to the active study of modern dramatic literature at the leading universities, both for young men and young women. This study begets, or helps to beget, a numerous public which is interested, not merely in the drama of commerce, but in almost every manifestation of intellectual activity in dramatic form.

To give a few examples: Maeterlinck's "Monna Vanna" has been played with marked success by Madame Kalisch; both Tolstoy's "Powers of Darkness" and Ostrovsky's famous play, "The Storm," have been acted with considerable acceptance by professional players; Hauptman's "Sunken Bell," and Sudermann's "Johannes," have for years held a prominent place in the repertory of Mr. Sothern and Miss Marlowe; Miss Nance O'Neill has found Sudermann's "Johannisfeuer" an attractive production; Mr. Richard Mansfield has added to his current repertory Molière's 'Misanthrope" and Schiller's "Don Carlos." In short, many plays which in England are either not acted at all, or presented only to special audiences of pronounced literary tastes, are in America received with more or less appreciation by the general public.

This American receptivity is, however, most clearly apparent in the ready acceptance accorded to several of the plays of both Henrik Ibsen and Bernard Shaw. On the very night of my arrival in New York, "Mrs. Warren's Profession" was given for the last time at the Manhattan Theater, after a run of about a month. I saw this last performance, and found it attended by a very fair audience, which received the play, on the whole, quite intelligently. Once or twice they laughed in the wrong place; but really an audience is to be excused which does not quite know what to make of such a play as "Mrs. Warren." Mr. Shaw himself is so apt to laugh in the wrong place that he cannot blame his public for doing so now and then. Simply as a matter of taste, then, I am not very desirous of seeing these plays offered to the miscellaneous audiences of provincial cities, whether American or English. But the fact that it is for a moment possible in America—that it should ever enter anybody's head to send them "on the road"—proves that the American public has a many-sided receptivity unknown in England.

A week or two later I came across Mr. Shaw's "Man and Superman," at Nixon's Theater, Pittsburg—execrably acted (save by Mr. Robert Loraine), but received with evident pleasure by a good audience. Imagine "Man and Superman" in Middlesborough or Hanley!

But the acceptance of Ibsen in America is, after all, the final proof of the point I am making—namely that the American public shows a much livelier curiosity in things theatrical than the English. I say "curiosity," because to say "intelligence" would, perhaps, be to beg a question. To be quite frank, one is not greatly struck by the intelligence with which one commonly hears Ibsen discussed. But the frequency with which he is acted, and the persistency with which he is discussed, show that, if they do not quite understand him, the American public are at any rate eager to get at the heart of his mystery. Their mistake lies, indeed, in their determination to see mysteries and enigmas where none exist, and where plain common-sense, helped out with a little imagination, affords all necessary guidance.

Within a month or so of my arrival in New York, six of Ibsen's plays were performed in that city.

Mr. Richard Mansfield, as all the world knows, has produced with great success a magnificently mounted version of "Peer Gynt"; Miss Grace George has appeared several times in "The Lady from the Sea"; and, finally, Madame Alla Nazimova has made the dramatic sensation of the past winter season in "Hedda Gabler" and "A Doll's House."

This young Russian actress is one of the most interesting figures in American theatrical life. She came to America a couple of years ago with a Russian company, and acted, among other parts, Regina in "Ghosts" and Hilda in "The Master Builder." Her success was such that she determined to learn English and seek her career on the English-speaking stage. I am credibly assured that in July, 1906, she knew not a word of our

language. She set herself to master it with such assiduity and such marvelous quickness of ear and brain that in November she was able to make her first appearance as Hedda Gabler. This performance took New York by storm, and was repeated thruout the winter, more than a hundred times, Nora in "A Doll's House" being thrown in at frequent matinées. Madame Nazimova's English is very refined and charming, the best I ever heard a foreigner speak on the stage, with the possible exception of Madame Modjeska. But she gets over some of the difficulties of our pronunciation by adroitly slurring them in such a way as to render herself inaudible to hearers at a distance. She will have to devote more time to her articulation if she is to do her talent full justice in the American or English theater.

What, now, of her talent itself? She is certainly an artist of very remarkable and delightful gifts. Her beauty of feature, her physical grace, suppleness and adroitness are beyond all question; and her power of expression is quite extraordinary. So is her power of impersonation: her Nora is so clearly differentiated from her Hedda Gabler that she scarcely seems to be the same woman. Her voice, tho high pitched, is very sweet and pleasing; she sings rather than speaks her parts, yet the effect is, in the main, delightful. She possesses, in a word, all the gifts of a very great actress, with a strong and alert intelligence behind them. Is she, then, a very great actress? As yet, I should scarcely say so. She does many admirable and even wonderful things; but her theory of art seems to me radically defective. She is an inveterate effect hunter; she will not let her parts play themselves simply and straightforwardly, but is alway challenging the attention of the audience with strained and studied points, and eking out the author's design with embroideries of her own. The first two acts of her Hedda Gabler seemed to me alarming examples of a vicious method. She was never living; she was acting all the time. She began by enormously exaggerating Hedda's morbid and neurotic physical state. While George Tesman and Aunt Julia kept on telling us how wonderfully well Hedda was looking, Madame Nazimova had the face, gestures and attitudes of a woman sick unto death. Had the excellent Aunt Julia so much as looked at her she would instantly have sent for the doctor, if not for the ambulance. Then the actress was all the while making the most lavish use of her powers of facial expression in order to force upon us the consciousness of her boredom, her malignity and her exasperation. Thea Elvsted (ably played by Miss Florence Kahn) was forced to pour forth her confidences with her head resting on Hedda's bosom in order that Madame Nazimova might make weird clawing motions over and around the luxuriant masses of hair which so vividly excited Hedda's envy. This is only one characteristic instance of the way in which the actress continually insisted on helping the author out with extraneous inventions of her own. This may be called the Beerbohm-Tree method of interpretation; and Madame Nazimova carried it to excess. Meanwhile she flagrantly neglected in her stage arrangement the poet's explicit and always admirable directions, thus sadly impairing the crispness of his character drawing, the clearness of his dramatic effects.

But I must not part from Madame Nazimova on this querulous key. In the later acts of "Hedda Gabler" and thruout "A Doll's House" she often rose to great hights of power and of passion. The second half of the third act of "Hedda Gabler"—from Lövborg's entrance right up to the burning of the manuscript—was memorably fine and even masterly. In her manipulation of the manuscript thruout this scene she departed from Ibsen's intentions, but in such a splendidly imaginative way that I am sure he would readily have forgiven her. In the last act of "Hedda" she was very fine; in the first act of "A Doll's House" she was almost perfect; and in the last acts she needed only a little more dignity and a little less combativeness in her discussion with Helmer to be altogether admirable. If she will but beware of her tendency to make too frequent points and to thrust them home too insistently, Madame Nazimova has every chance of making a great mark in dramatic history.

LONDON, ENGLAND.

Literature

A Trilogy of the Railway

THREE novels of the railway lie before us, and by felicitous chance each deals with one of the three great phases of the subject: construction, operation and piratical manipulation—a chronological sequence.

The Iron Way[1] supplies the romance of construction. It is truly an historical romance, and derives its story from probably the most romantic history in the annals of railway building—that of the Central Pacific, the first "iron way" to thread the mazes and surmount the ramparts of the Rockies, the first to unite the Middle West and the glittering Pacific Coast. The book is doubly modern: it is romance rushing on the heels of history. Thru its pages move personages so lately alive as Leland Stanford, Collis P. Huntington, Mark Hopkins and Charles Crocker; and a niece of Crocker, who, if not fictitious, might well be living today, is the siren that, innocently enough, lures the hero into seeming disloyalty to his own true love. These men were the far-sighted, dauntless "Four" who conceived the great enterprise and stubbornly fought it to triumphant completion against obstacles almost incredible in character and multiplicity. One feels that one is reading authentic history, but such is the art of the writer that the deftly inwoven romance—a capitvating love story—remains the predominant interest. It would appear that the book is Mrs. Carr's début in literature, yet it is written with an ease, a freshness and a power which many a practiced hand would be glad to have acquired. Her exceeding competency for the special task arises from the fact that in early years she lived with the railway as it grew—her father having been one of the builders at "the front."

The Diamond Key[2] unlocks to view some gems of the story-teller's art, very pure in ray. Strictly speaking, it is not a novel, yet the ten stories are so welded together by the rails of the "Western Central," the brotherhood of the characters, and the common atmosphere of the events, that the book possesses a oneness unattained by many a professed unity. It gives us the romance of the operating force face to face with the vast potentialities of disaster resident in mighty Baldwin compounds, in the steep grades of a mountainous region, in miles upon miles of inflammable snow-sheds, in the spring floods which descend from snow-clad peaks, and in the fallibilities and malice of men. It deals, therefore, with large catastrophes, which would be larger but for the signal heroisms which abort them and win from the company the prized guerdon of "the diamond key." They are thrilling, healthful tales, told in crisp, lucid, scintillating English, which makes this book, in point of style, the est of the three.

It is descending from mountain ozone to the air of a "mausoleum"—as the author calls his titular hero's barbaric marble palace—to open now the pages of *Caleb Conover, Railroader.*[3] This is not Mr. Terhune's fault—rather, his merit. He has set out to induct the reader into a densely vitiated atmosphere, and his success is considerable and creditable. Vastly more obscure and poor than the Corsican, and in addition illiterate, Caleb Conover has become by the masterful force of his natural endowment a "Napoleon of Finance." Hence, he owns a railway system, and many who formerly owned parts of it are in plights worse than exiled Bourbons knew. But to be a railway magnate did not satisfy the boundless ambition of the Conover. By means of his railways, the millions they have brought him, and his own genius for practical affairs, he adds to his possessions the Legislature, the newspa-

[1] THE IRON WAY. *By Sarah Pratt Carr.* Chicago: A. C. McClurg & Co. $1.50.

[2] THE DIAMOND KEY. *By Alvah Milton Kerr.* Boston: Lothrop, Lee & Shepard Co. $1.50.

[3] CALEB CONOVER, RAILROADER. *By Albert Payson Terhune.* New York and London: The Authors and Newspapers Association. 50 cents.

pers and the dominant party of his State. And it is with his career as an imperious, despotic and unspeakably corrupt political Boss that Mr. Terhune chiefly concerns himself—tho the militant railway as a basis and bulwark of Conover's empire is kept constantly in sight. This book is one of the strongest studies ever made of the American "Big Boss," and from beginning to end is increasingly clever and interesting.

The Political History of England*

THE reigns of the Lancastrian and Yorkist Kings of England cover the long period of twilight, when the nation had begun to stir uneasily and to awake from the long slumber of the Middle Ages, but before the light of modern day, which began to be shed on English history in the reigns of Henry VII and Henry VIII had yet appeared. And the first sign of this awakening of the nation may well be taken to be the great peasant rising of 1381. A thousand causes of friction between the mass of the people and the owners of the land—between the haves and the have-nots—had existed for a generation previous to 1381. Many of them dated back to the Black Death of 1348—that great calamity which swept off from 25 to 60 per cent. of the population. The rising under Wat Tyler was the first great movement of organized discontent on the part of the people of England. It differed entirely from the civil wars of Stephen and Matilda; of the Yorkists and Lancastrians, or even of King John and his barons, in that it was the people themselves, under their own leaders, who rose in rebellion against the governing classes. All the previous wars in England and some of the later ones were between sections of the aristocracy. At times the people ranged themselves on one side or another; but it was in 1381 that, for the first time, a demand for reform, backed by armed force, was made by the downtrodden workers of town and country.

In the fourth volume of *The Political History of England* Professor Oman treats this period with much thoroness and freshness. It is a period essentially his own, for he has already described it in "The Great Revolt of 1381"; and to it and to the remainder of the troubled reign of Richard II he devotes a somewhat disproportionate amount of his space.

With the battle of Bosworth Field Mr. Fisher takes up the story and devotes five hundred pages to the reigns of the first two Tudor sovereigns, Henry VII and Henry VIII. In several respects Mr. Fisher has great advantages over the authors of the earlier volumes in *The Political History of England.* Instead of having to grope among old, untrustworthy chronicles and scanty records, Mr. Fisher has to hand an abundance of reliable contemporary writings, chief among which are the letters and papers of King Henry VIII, which throw light on every aspect of Henry's reign and character. The second great advantage is that Mr. Fisher is given much more space for the sixty years he covers than was allowed for a similar period to his predecessors. The very modern nature of the problems of England in these Tudor reigns is also an advantage to the historian. Commerce and industry, tariffs reciprocal and retaliatory, shipping restrictions and trading privileges, land, labor and capital, all occupied the attention of King and Parliament in the reign of Henry VII; while in the reign of Henry VIII Parliament began to concern itself with subjects of even wider interest—the relations of Church and State, the religious creed of the nation, and the succession to the throne. This volume of *The Political History* contains what is probably the best account of Henry VIII yet written. It is hardly too much to say that Henry VIII was the last really English King of England before George III. Edward VI died too young to reign. The Stuart Kings were Scotch rather than English, and William III never thoroly naturalized, while the first two Georges were thoroly German. A reading of Mr. Fisher's analysis of Henry VIII goes far to convince one

* THE POLITICAL HISTORY OF ENGLAND. *Edited by William Hunt, D.Litt.,* and *R. L. Poole, M.A.* Vol. IV. FROM THE ACCESSION OF RICHARD II TO THE DEATH OF RICHARD III (1377-1485). *By C. Oman, M.A.* Pp. xvi, 525. Vol. V. FROM THE ACCESSION OF HENRY VII TO THE DEATH OF HENRY VIII (1485-1547). *By H. L. Fischer, M.A.* Pp. xx, 518. New York and London: Longmans, Green & Co. $2.60 per volume.

that Henry VIII is the prototype on which the typical John Bull is modeled. Bluff, hearty and burly; insolent and yet generous and good-humored; with a bulldog tenacity of purpose and with genuine conscientiousness, and yet with a conscience frequently molded to his own desires, Henry VIII was the epitome of the best and worst traits of the English nation.

For a period of English history for which the authorities are abundant, the student may demand much more than is to be found in Mr. Fisher's volume; but for popular reading it offers in perfection, both as regards matter and style, a general view of the events and causes which tore England out of the Roman Catholic communion and brought about the establishment of the Anglican Church and the isolation of England as a self-contained nation.

Madame De Treymes. By Edith Wharton. New York: Charles Scribner's Sons. $1.50

If this book is founded upon any circumstances in the present life of Anna Gould, it is a bad beginning of legalized widowhood for her. Certainly it contains something remotely suggestive of the de Castellane's marital troubles. An American woman who has been divorced from her profligate French husband is about to marry again. Thru the intrigues of her husband's family she is almost in sight of the altar when it is discovered that the child of her first marriage would then revert to her husband's family. The question of honor with the prospective bridegroom is whether he will tell her or not. But that is not what the story is really about. The author's idea evaporated into Henry James subtleties, and so it is merely a little pamphlet of elegant discriminations. It is a novel that will please those leisurely curious persons who take delight in Chinese puzzles, in the artistically carved box, which, being opened, discloses another box equally difficult to penetrate and equally devoid of profitable contents when it is opened. At each chapter of Mrs. Wharton's story the reader flatters himself that he has gained an understanding of the motives of the characters, only to be disappointed at the revelation of a deeper depth. It is a psychological detective story.

Modern Music and Musicians. By R. A. Streatfield. New York: The Macmillan Co. $2.75.

The word "modern" as Mr. Streatfield uses it in this connection is all-embracing. To him "modern music" means about all the music to which modern people care to listen. His nineteen chapters are so many essays on the foremost composers of music from Palestrina (born about 1526) to Richard Strauss—"the men who have most aided the development of modern music." He wrote the book, he tells us, "to trace, in a study of the works of the great composers, the growth of the idea of a poetic basis in music." In some of the essays he seems to have forgotten that purpose entirely, but for the most part he does adhere to his aim "to give as little space as possible to the merely biographical side, save where the incidents of a composer's life affected his music in any salient manner, and to lay stress upon the development of music as a means of personal expression, rather than upon its merely technical history, by tracing the character of a composer in his music rather than by criticising his works in detail." All his chapters are interesting, tho some are marred by rhetorical skyrockets. He has the courage of his convictions and utters some new opinions that are worth considering; but he also publishes some opinions (and even a few misstatements of fact) which prove that his authoritative pose is not wholly justified. Only unreasoning prejudice or sheer thoughtlessness could father the statement that "over all Chopin's music lies the deadly trail of disease." And to say of Tchaikovsky that "he sinks to morbid pessimism, he rises to hysteria" is surely to utter a snap judgment—on ill-considered and insufficient evidence. Again, the poem on which (according to Mr. Streatfield) Strauss's "Death and Transfiguration" is founded, was written *after* that wonderfully beautiful tone-poem and was inspired by the music! But there are many good things in the book. The musical eclectic will agree with the author's characterization of our own "dull, pedantic

era, when everything that has a tinge of novelty in it is hooted and derided by a compact phalanx of Philistines sworn to the extermination of all that ventures beyond the radius of their own bleared eyesight."

The Master Spirit. By Sir William Magnay. Boston: Little, Brown & Co. $1.50.

The *Master-Spirit* is the strongest novel yet written by Sir William Magnay, author of "A Prince of Lovers," a "Mantrap," etc. London society is cleverly presented. Dukes, diplomats, great dames and parvenus are delicately satirized, and those who do not read novels for the plot alone are entertained by epigramatic criticism of life. The hero, Geoffrey Herriard, is first exhibited as the mouthpiece of Paul Gastineau, who was supposed to have been killed in a railway accident. Chained to his couch, a cripple, Gastineau continues his political battles thru his pupil, who blindly obeys him and reaps undreamed of success. After four years his conscience awakes thru love of a noble woman and the result is a break with Gastineau, regardless of possible ruin. Gastineau is a veritable Iago, malicious, vindictive, loving evil for its own sake, sinning with impunity because of his unerring, cool judgment and unscrupulousness. The ensuing complications sustain the interest, and the subsequent reward and punishment of virtue and vice satisfy the ethical demands of the reading public.

The Fool of the World and Other Poems. By Arthur Symons. New York: John Lane Co. $1.50.

In 1902 Mr. Symons gathered the contents of five preceding books of verse into a single collection. Since that time he has been mostly engaged with prose, writing exquisitely impressionistic descriptions of cities, essays of romantic criticism, and other volumes of the sort. Now comes a new vintage of verse, and one naturally examines it first to see what change or progress he has made during the five years of reflection on his art. And some change one discovers, but of progress scarcely any. The chief note of the volumes of 1902 was an acrid personality seeking satisfaction in all the vain and windy ways of the most extravagant impressionism. He was, and is, the best representative of a certain school of French symbolism, the interpreter of the illusion of the flesh. There were indications at the close of the earlier collection that the old moods had begun to weary him, and that his more personal themes were likely to give place to a romantic nature-worship. In part that prophecy is fulfilled in the present volume. There is very little here of that peculiar love poetry of symbolism which tries to disguise a morbid passion in terms of the soul; scarcely a touch of immorality. Nature has become more prominent; but it is still nature seen thru the veil of illusion. There is no sense of stability, no fixt forms, but the vague, indiscriminate motion of one who sees in nature a reflection of his unstable romantic moods. It it thus not accidental that the winds are the phenomenon chiefly described. The tone of the book may be understood from a single example, such as "Wind at Night":

> The night was full of wind that ran
> Like a strong, blind, distracted man
> About the fields in the loud rain;
> The night was full of the wind's pain.
>
> I looked into the naked air,
> Only the crying wind was there,
> In wet invisible torment, tossed
> About the darkness like a ghost.
>
> My thought in me cried out, and sought
> Only, like wind, to fly from thought;
> But like my thought the wind could find
> Nowhere to hide out of the wind.

Katherine. By E. Temple Thurston. New York: Harper Bros. $1.50.

Some years ago Mr. Thurston wrote "The Apple of Eden." It was a novel, but designed to prove that every Man-Adam must eat some Eve's apple whether he was willing or not, and that he was sure to suffer accordingly. It was not a comforting book, but it was well written, and indicated that the author knew how to trace the relation between cause and effect with diabolical accuracy. The story belonged, indeed, to that appalling class of fiction known as powerful. For that reason we are the more surprised at the quality of this new novel, which shows all the subtlety of analysis so noticeable in "The Apple of Eden," but lacks the originality and

strength of that story. And that is not the worst of it. We have been afflicted of late with what may be called the malignant romance. Within the year we have had three notable books of this kind. First Edith Rickert, in her story of "Folly," bases the sequel upon the pathology of a cancer case. Then Mary Wilkins Freeman, of all people!—presents a magnificent woman in her novel, "The Doctor," also afflicted with this malady. Thurston follows suit with *Katherine*. The heroine determines to go to the bad and have a good time, because she thinks she has cancer and has only two years in which to live. There was a time, of course, when the heroine of almost any novel was likely to go into a decline. But that was all the more reason why she spent the time behaving herself and leading the other characters to repentance. Besides, the real pathology of her disorder was never exposed. She simply "faded," but it is characteristic of the horror-minded present that a writer like Mr. Thurston should dramatize the diagnosis of cancer and call it a romance.

Literary Notes

....*The Statesman's Year Book* for 1907, just received from the Macmillan Co., is one of the absolutely indispensable and most compact books of reference that all people interested in public affairs must have. It tells all essential facts about all countries, and has 1,672 pages for only three dollars.

....In an introduction to *The Steps of Life: Further Essays on Happiness*, by Carl Hilty, Professor Peabody aptly characterizes the distinguished Swiss teacher of constitutional law as a "spiritually minded man of the world." This volume is translated by the Rev. Melvin Brandow, and is similar in theme and treatment to the author's "Glück," which has had such wide circulation and influence both abroad and here. (The Macmillan Co. $1.25.)

....A third edition has been reached of the considerable volume of *Addresses on the Gospel of St. John*, delivered at a series of interdenominational conferences at Providence, R. I. The papers are by a large number of theological teachers and clergymen, and are of varying merit and interest. The literary and historical problems presented by the Gospel are not considered. The book is published at Providence by the St. John Conference Committee, Mr. Albert L. Day, chairman. ($1.25.)

....The Marion Press, one of the best of the private presses, and located at Jamaica, Queens Borough, New York, celebrates its tenth year of existence (1896-1906) by issuing a list of books printed by it. The edition is limited to 750 copies. The frontispiece of the list is made notable by the introduction therein of an impression from an original woodcut engraved about 1802 by Dr. Alexander Anderson, the first American wood engraver, after Bewick. It contains 120 numbers and includes some superb examples of the printing art. Frank E. Hopkins is the moving spirit of the press. The list is well worth the attention of all book lovers.

Pebbles

If you would have a thing well done, order the waiter to bring it rare—and give no tips.—*The Philistine.*

CONCERNING FAIRY TALES.

"I say, mamma," asked little Tommy, "do fairy tales always begin with 'Once upon a time,'"

"No, dear, not always," replied mamma; "they sometimes begin with 'My love, I have been detained at the office again tonight.'"—*Glasgow News.*

Two women were strangers to each other at a reception. After a few moments' desultory talk the first said rather querulously:

"I don't know what's the matter with that tall, blond gentleman over there. He was so attentive a while ago, but he won't look at me now."

"Perhaps," said the other, "he saw me come in. He's my husband."—*North American Review.*

THE RETORT HUMOROUS.

"You don't seem to understand," blustered the man who was trying to make his point with a university professor. "I tell you, sir, I ought to know. I'm an alumni of this institution myself." "Are you? That's not singular," was the witty rejoinder, uttered so quietly that the blustering man never knew what had happened.

On another occasion the same professor, having ordered from a music publishing house a copy of a "Valse Impromptu" by a certain French composer, received an "Impromptu Waltz" by another man. The publishers, when called to account for their mistake, replied rather insolently that they had been in the music publishing business a long time, and had yet to discover the difference between a "Valse Impromptu" and an "Impromptu Waltz." Would Dr. Smith kindly state to them that difference?

"Gentlemen," wrote the genial professor, in answer, "I have not, like yourselves, been in the music publishing business, and am therefore not fully qualified to inform you, but since, in your extremity, you have appealed to me, I would venture to suggest that the difference between a 'Valse Impromptu' and an 'Impromptu Waltz' may be similar to the difference between a blind Venetian and a Venetian blind.

"Yours very truly," and so forth.—*Youth's Companion.*

Editorials

Not a Revolution

About this time, if we might judge from previous French history, a revolution may be expected in France, for the Republic has persisted for thirty-five years. That is long enough, to judge from the precedents, for it to endure. We of the United States, with a republic old enough to have a history and a presumed lease of life, and who have not the fickle French reputation, have been rejoiced that what we believe to be the ideal system of government has been able to hold the votes of the French people, and to withhold its arms, for a full generation, and we have been anxious for the future. We remember the previous alternations for over a century; and we have observed with what tolerance the Republic has endured Royalist and Imperialist claimants and parties that made no concealment of their desire to restore a "Legitimist" rule. But a generation has been trained in a republican form of government, and only old men have any memory of that government which brought disaster and the loss of Alsace and Lorraine. The younger generation hardly know of Louis Napoleon except as they see his widow, the Empress, making personal claim to objects of historical value held by the nation.

But this disturbance in the South of France has caused a real anxiety. It has come suddenly, and among an excitable and a religiously conservative people. It is perfectly well known that the ecclesiastics do not love the Republic; they hate it. They have all along wished to restore King or Emperor, under whom they have had their own way. This was reason enough why the Republic has feared the Church, charging it with constant plotting of treason, and with much proof. This outbreak appears to have been encouraged by the Royalist and ecclesiastic leaders, and the story is by no means unlikely that it has been thus financed. It is so probable that evidence would not be waited for before it was asserted. A revolution would afford a grateful way to repay the losses involved in the separation of Church and State and the assumption of ecclesiastical buildings as public property. Thus this property would be restored and the "robberies" atoned for.

But this will not be. It is against the present Government and not against the Republic that the manifestants have acclaimed. They profess their love for the Republic. They may love the Church, but they love the Republic more. They know the vigor and intelligence by which it has revived the power of France since Sedan, and how it has created an Empire in Africa and in Asia such as Napoleon never dreamed of. They only ask the Republic to see their misfortunes and to relieve them.

But yet there was danger in such an excitable body of people suffering greatly from changed industrial conditions. A successful revolt might have given occasion for some new Man on Horseback to seize the reins of power, and draw to him all the malcontents, who are very strong among the officers of the army. We have observed how General Picquart was hooted, the man who best represents in the army the new as against the old régime. But the credit for crushing the revolt belongs to M. Clemenceau, one of the strongest men that France has ever called to the helm. He knows the Meridionaux, for he is himself from the South of France. He has sent thither soldiers enough to overawe and crush all opposition, and he has done it with as gentle a constraint as was consistent with vigor. He would not call them rebels, but misguided citizens. Thus the Republic has been preserved, and, having escaped this crisis, we may hope that its last danger period has been past.

It is a curious freak of fate that this task of forcible suppression of a popular revolt should have come to M. Clemenceau, the most radical, not to say Socialistic, ruler that France has had since 1870. Just so it has been the duty of John Mor-

ley to suppress a threatened uprising in India. This gives us occasion to consider what will be the rôle of Socialism if it should ever come to rule in a State. If we may judge from M. Clemenceau's example it will not hesitate to use steel and lead to keep its own rule. It will not allow anarchy. Its subjects, who are also its lawmakers, will have to obey its laws. Its hand will be as heavy on the people as any other hand. A revolt will be put down just as imperiously as in an Empire. Why not? for in the most Socialistic democracy the people must rule, and rebellion of a minority of the people against the majority must be overcome, that the will of the people may be supreme. We are not at all sure that whips may not be changed to scorpions.

What Is a Democrat?

Mr. Bryan was asked by the New York *World* to answer the question, "What is a Democrat?" He answers it—or fails to answer it—in a letter which it would take half an hour to read, and which at the end has told nothing but a platitude. He thus concludes his screed:

"I do not understand that there is or can be any controversy over the doctrine that one is democratic when he trusts the people, and undemocratic when he distrusts them."

That is all. The answer is empty and disappointing. He goes to the Greek he learned in college and tells us that *democrat* means *the people ruling*. True, but what of that? What was wanted was the definition of the present-day Democrat in politics. He quotes Jefferson and Hamilton, but they were a hundred years ago, and ours are different politics from those in their day. Both our parties declare they trust the people, and certainly the Republican party, especially in the South, trusts the people more than the Democratic party does, for there definitely the attempt has been made to shut out a third of the people—in some States half the people—from the ballot.

Mr. Bryan says that if he were to apply his definition to particular questions he would have to enter the field of controversy. But it is the application of the definition that we want to know about, not that on which "there is no controversy." He does make one application, namely, to the popular election of Senators, nothing more—nothing on tariff protection, or control of corporations, or public ownership of railroads. It is an empty and vapid and tedious explication of the lexically obvious. He says

"an undisputed thing in such a solemn way."

Yet he had no easy task set to him, and could do little more, for what is the difference nowadays between a Democrat and a Republican? Would it be any easier to define the latter word? Perhaps the best definition would be that a Republican is one that follows Roosevelt and a Democrat one who follows Bryan, and they are both after the same thing. At least, Colonel Watterson says so, and Bryan also.

To show how identical are the principles of the two parties on the chief questions before the country at the present time, it is sufficient to take the chief public matters as presented by Justice Gaynor, of the Appellate Division of the Supreme Court of New York at the alumni dinner of Colgate University. He was speaking of the great economic reforms that are in sight: Our railroads are to be "not private roads, but public highways," "to be run for the equal benefit and use of all, and in which there can be no discrimination or favoritism of rates" by which favored persons can secure monopoly; "we are about to stop fraudulent bond watering and swindling; and we are to revise our tariff laws so as to remove the tax on raw material which we cannot produce ourselves." This is all equally good Republican and Democratic doctrine.

The Turn of the Tide

For nearly eight years the prosperity of the United States has been unexampled. For much more than eight years our prosperity has received no serious check. The general level of prices at present is higher than it has been at any time since the Civil War. At no time within the memory of living men has it been so easy for men of fair business sagacity and plenty of enterprise to make moderate fortunes. Never within recorded history has it been so easy for

men of exceptional ability to make enormous fortunes. To a great extent wage-earners have shared in the general advance of income. To one large and important class in the community, however, these times of abundance have been years of increasing hardship. Interest incomes from savings have, on the whole, diminished, and salaries have not increased. Army and navy men, men and women in the Civil Service, college and university professors are in general not more than one-half as well off as they were eight years ago. To the extent that their characters are not altruistic without alloy, they are praying in their secret hearts for hard times and a good long stretch of low prices. In passing, we may remark that the business public is unwise thus to convert the active intellectual element in modern society into an effective corps of the army of the discontented.

More than one great cause has co-operated in producing this exceptional period of affluence. First and most fundamental has been one that has seldom been mentioned since the defeat of Mr. Bryan by Mr. McKinley in the presidential campaign of 1896. Mr. Bryan and his supporters argued that a prolonged period of low prices had been caused by a progressive contraction of the circulating medium consequent upon the demonetization of silver and a relative shrinkage of the world's gold supply. For remedy they proposed the free coinage of silver at the old ratio of sixteen to one. The Republican party and Mr. McKinley, belatedly converted to gold monometalism, argued that it was before all things else necessary to maintain commercial and national credit at the highest level, and that to this end the single gold standard must be definitely adhered to.

By a strange coincidence of events, the causes that Mr. Bryan desired to set in operation, and the causes that the McKinley Republicans desired to give free play, conspired together to create extraordinary results. By pronouncing for the gold standard, the nation strengthened its credit, and at the same moment the world's gold supply began to increase from the Klondike and elsewhere with unparalleled rapidity. Both the metallic basis of circulation and the credit based thereon began to undergo an enormous expansion. Prices, of course, rose.

Co-operating with these causes came year after year phenomenal crops, the concrete basis of all real abundance, as distinguished from mere market values. Big crops means abundant purchases of manufactured goods by farmers, a heavy business for the railroads, and a correspondingly large demand for iron, steel and machinery.

Finally, when business is expanding, the temper of the people is hopeful, enterprise is stimulated and the industrial public creates an over-supply of goods in anticipation of growing needs.

When this stage of anticipatory production, and a corresponding extension of credit, has been reached, a very slight check may suffice to turn the tide. A real and serious check sets it strongly flowing toward the ebb.

It is generally conceded that we have now probably come to the turn of the tide and that we must look forward to a certain shrinking of the general volume of business and a downward course of prices. In financial circles more than one event of the past year has been interpreted as a check in itself sufficient to cause reaction. Chief among these, in the estimation of people who never can think beyond personal to impersonal causes, has been Mr. Roosevelt's determination to bring the railroads under public control. Disturbances in the stock market have been explained as a natural result of the undermining of confidence in railroad properties. The railroads are not pushing vigorously the expansions and improvements which, we are assured by Mr. Hill and Mr. Harriman, must be completed before the railroads can properly handle the country's business.

How much or how little importance may properly be attached to the effect of national legislation upon railroad business, a real cause of shrinkage has at last appeared and its effects cannot be escaped. There seems now to be no doubt that crops this year in the United States and elsewhere will fall somewhat short of past production. Past experience leads us to expect that a series of years of abundant crops will probably be followed by a series of years of somewhat deficient crops. If this shall prove to be

the fact we must accept as best we can the inevitable decrease of business, contraction of credit, fall of prices, increased percentage of business failures and enlarging number of men out of work.

We venture to say that an anticipation of this probably inevitable decrease of business for the next few years is the real reason why the railroad corporations are not now planning and pushing reconstruction and expansion work. Railroad legislation is merely the excuse. Ten years from now the appeal to such an excuse will have passed into the category of childish things. For, as a result of a firm and just public control, the railroads will pass thru a period of hard times with far less loss and disorganization than they could hope for if they had been left to their own throat-cutting devices, and the total amount of disaster to general business interests will probably be much less in proportion to the total extent of business operations than it has been in former periods of depression.

The Suppression of Discussion

ROME has spoken; but is the case ended?

One of the excellent acts of Leo XIV was to appoint a Biblical Commission to study the relation of the Church to the doctrine of Scripture. It was expected, and probably intended, that the decision would somewhat extend the liberty of the faithful in their study of Scripture and make some concession to the critical conclusions now more generally accepted. But Leo died and a "religious" Pope was elected to take the place of a "political" one. By taking the name of Pius he gave notice to the Church that he would follow in the footsteps of Pius IX rather than of Leo XIV. His reconstruction of the Biblical Commission, and its conclusions thus far announced, have shown that the liberty allowed in the Church, so far from being widened, will be seriously narrowed.

The first decision, after the accession of Pius, was to declare to the Church that there is no evidence to show that the Pentateuch was not written by Moses, altho he might have made use of antecedent documents. Now the Commission has gone over to the New Testament and has made remarkable decisions on the Fourth Gospel. The decisions are put in the form of long questions, like the hypothetic questions put to a lunacy expert, to which a categorical answer is expected. Here are three long questions to which the answer Yes or No is simply given, but which we may put in the positive instead of the interrogative form.

It is first stated that it has been proved that the Apostle John, and no other, must be recognized as the author of the Fourth Gospel, and that this has been established by such certain historical proofs that the tradition which has come down to us that John wrote the Gospel is well founded. This is shown by the agreement of the Fathers and by the name of John attached to the Gospel on the canon and in the text of Sacred Books; by the ancient manuscript copies and the translations which attach his name to the Gospel; and by the liturgical usage from the foundation of the Church.

Next the Commission decides that the internal argument, with the testimony of the writer of the Gospel and its relationship to First Epistle of John, indubitably confirms the tradition; and this conclusion is not invalidated by any difficulties in reconciling statements with those made in the other three Gospels. Indeed, these difficulties, it is decided, have been reasonably explained by the Fathers and by Catholic exegetes.

Finally the Commission makes this decision:

> "It is not permissible to say that the facts recorded in the Fourth Gospel have been invented, in whole or in part, in the same way that allegorical and doctrinal symbols have been invented, and that the discourses attributed to our Lord were not really his, but were simply the theological compositions of the writer, altho they were put in the mouth of our Lord."

We may easily conclude that this decision, signed by Mgr. Vigouroux and Mgr. Janssens, secretaries of the Commission, and approved by the Pope, has a definite purpose. It is directed against the Abbé Loisy and his disciples. It is a definite and positive condemnation of their teachings, and is one way of condemning him and forbidding his views to be held or taught. It is an attack on

a Catholic school of theology which is in sympathy with modern criticism, and which has its adherents in this country as well as in France. It will be received with acclamation by those in the Church who deny that anything new can be learnt, and with dismay by other Catholics just as loyal to the Church.

Beyond question the arguments which support the authorship of the Fourth Gospel by John the beloved disciple are very strong, perhaps incontrovertible; but it is much more difficult to prove that the Fourth Gospel is historical in the same sense that the Synoptic Gospels are historical. The phenomena in it are not inconsistent with the view forbidden by this decision, that the Fourth Gospel has much the same relation to the other three that Plato's "Apology of Socrates" has to Xenophon's "Memorabilia." But here the startling phenomenon is that a body of more or less competent scholars propose to tell other scholars what is "permissible" for them to believe. The day of the Inquisition is past, when such decisions had any valid power. It is not an *ipse dixit*, but argument, which we would have. It is humiliating to intelligent scholarship to be told with ecclesiastical authority what we must believe, and no reason given. We are very sorry for those—and such there are—who must now keep silence or veil their belief in ambiguous language.

It is this necessary concealment which we most regret, next after the attempt to stifle discussion. The French priests are writing under *noms de plume*. Progressive Italian priests have published an open letter to His Holiness which attracts much attention, but they do not sign their names. In twenty or more pages is rehearsed the opposition of Rome to every advance in science, politics and knowledge. His Holiness will learn from this pamphlet that irreligion is widespread and growing because the clergy oppose the democratic aspirations of our times. Democracy demands of the Church not only less favor to the privileged classes, but also a complete change and clearing out both in usages and persons—the restoration, as it were, of the Church of the third century; the restoring to bishops their canonical rights in their sees; a larger influx of the lay world; some means to secure for the other nations a greater influence in the direction of the Church.

Next the letter touches upon the relations of the Church to science. A historical foundation for Christian Apologetics is demanded, with the critical study of the Bible and the right to apply the same laws of criticism to the Bible as to profane literature. After rehearsing the vital need of studying critically the New Testament and the Church's growth, the metaphysical aspect of Catholic dogma is touched upon, and the continuous evolution of Revelation is advocated. Lastly, the open letter claims that modern Apologetics and Church History are not opposed to the Fathers.

Finally, this group of Italian priests rehearse the missteps of Pius X in dealing with France, with the modern spirit, with individuals, such as Loisy, Tyrrell and Murri. It attacks bitterly the promotion to the Red Hat of Lorenzelli, who, "as is known to all, is a man of *la nauseante avarizia*," and has a rap at the unfortunate Montagnini.

Thruout the tone of the letter is bad. There seems a lack of courtesy to the Holy Father, whose age and exalted office, even if he blunder, would in an American's eye demand respect. But it indicates what is the conflict between the age of authority and the age of reason within the Church.

Mississippi's Repudiated Bonds

It is not that Mississippi is the only State which has repudiated its public debt that we select it for consideration, but because in Mississippi at the present time some of its most distinguished citizens are trying to persuade the State to remove the stigma on its reputation by redeeming its repudiated debt.

The Planters' Bank of Mississippi was chartered in 1830 by an act amended in 1833. By these two acts bonds of the State of Mississippi were issued to the amount of $2,000,000 to pay for the State's stock in the bank. They bore interest at 6 per cent. The bank flourished and paid interest on the bonds until, after the panic of 1837, which so shook the country, that the Legislature,

in 1830, transferred its stock in the bank to the Mississippi Railroad Company, with the provision that the stock in the company, and all stock of private individuals in it, should be pledged for the payment of the bonds of the Planters' Bank. But in 1844 an act provided to wind up both bank and company and pay the State's debt, and up to 1859 some $200,000 was paid in principal and coupons. In 1852 an act of the Legislature provided that, at the next election, every voter should declare whether he was willing that a direct tax be levied to pay the debt; but the popular vote was in the negative, altho the obligation of the debt was never questioned. The Civil War now intervened, and in the reconstruction period of 1875-6, when the white Democrats took possession, by a popular vote an amendment to the constitution was adopted whereby the payment of these bonds was prohibited. Thus positive repudiation followed a long default.

There is a much similar story of the larger obligation of the faith of the State pledged about the same time for the sum of $5,000,000 for bonds of the Union Bank, only that there was a fierce attempt later to declare the bonds illegal, on the ground that they were issued under a supplementary act of the Legislature, and not under the valid one; but the Supreme Court of Mississippi declared the bonds to be a true obligation. By the amendment to the constitution the payment of the Union Bank bonds, as well as of the Planters' Bank bonds, was prohibited, and that prohibition stands in the constitution of 1890. The total of the repudiated bonds is now about $8,500,000, and a well defined movement has now been inaugurated to secure their payment and cancellation.

Of course, this repudiation destroyed the credit of Mississippi in the money markets of the world. Even yet the injury as well as the sting of it is felt. The industrial regeneration of the State and of other repudiating States requires the settlement of this debt. For honor's sake, and also to bring about a political and industrial alignment between the South and the North, it is important that this debt be again recognized and honorably paid. The Hon. William S. McAllister, of Canton, Miss., is taking an active part in this movement, which will be a chief subject before the next Legislature. The great prosperity of the South of late years, and the many millions that have come to Mississippi from the enhanced price of cotton, make this a hopeful time to push this effort for honesty.

In an important address before the Mississippi Press Association last month, Bishop Galloway discussed the "Ethics of Politics," and made this duty the principal application of his topic. He said:

> "The perpetual humiliation of Mississippi is the fact that the word repudiation was ever attached to her great name. And thru all the years to come, whatever the apology or explanation of that ever-to-be-lamented act, the State cannot escape a measure of disgrace. The statute of limitation can never run against genuine honesty. Tho three generations have passed since the State repudiated obligations on which her great seal had been set, it is not too late to right a wrong, and thereby become a stainless example to every one of her loyal citizens. It weakens an appeal of the State for her own name to be linked with the word repudiation—a word that contains the very exhaustion of disgrace and disgust. Every reading of that mournful history of the Planters and Union Bank bonds and their formal repudiation, after a fierce factional struggle, and over the solemn deliverance of the Supreme Court of the State affirming their validity, stirs within me the hope that some day that whole record may be sponged out by the unanimous and indignant voice of an aroused Commonwealth."

It is to be hoped that this noble utterance will be heeded. It comes from one of the best men the South has raised to defend her honor, and we are not surprised to see that Bishop Galloway added that political ethics requires that "the highest and the humblest, the richest and the poorest, the strongest and the weakest, the whitest and the blackest, must have the same legal and governmental consideration and protection." The whitest and the blackest do not now have it, and the revival of public honor may be expected to cover racial as well as financial justice.

May we not hope that this effort in Mississippi may stir up some other States. Michigan may think of it, and so may Minnesota, and so may a number of Southern States. It is bad company and a bad condition for a State to allow itself to remain in.

Railways and Business

When Mr. James J. Hill predicted, two weeks ago, that the Government would ultimately be forced to help the railroads by a loan of its credit, because their own credit had been impaired and was in danger of being ruined, scarcely any railroad manager or financier could be found who would say that he had any warrant for such pessimistic views. Some allowance must be made for the feelings of a veteran railway captain who has seen, in one year, the market price of the shares of one of his lines fall from $348 to $122, and the price of shares in the other drop from $232 to $123. Such declines tend to make Mr. Hill forget even his sale of 1,000,000,000 tons of iron ore to the Steel Corporation. The discussion which his gloomy remarks provoked disclosed the confidence of many other railroad officers in the ability of their companies to exist and do business profitably without Government aid. "The American people and the national Government," said one of these officers, "can be counted upon to favor nothing that will ruin legitimate business enterprises." All who have faith in American institutions must believe this to be true.

The address, last week, of Mr. Vanderlip, vice-president of the great National City Bank, to an association of bankers at Jamestown, is a notable contribution to what may be called the current literature of railway, financial and commercial problems. On account of his business associations, as well as by reason of his knowledge of his subject, Mr. Vanderlip's infrequent public addresses have had much weight. This one covers so much ground that we can refer only to parts of it. When we speak of his business associations, we have in mind the relation of his bank to the most powerful group of American capitalists, to the Union Pacific system, and to other corporate interests. His bank's president was one of Mr. Harriman's three associates in the Alton syndicate. Mr. Vanderlip's review of financial conditions at home and abroad, and of the railway situation, especially the financial aspect of it, is the work of a competent hand. He does not overlook the unlawful practices and other offenses of railway companies and managers. He criticises fairly the recent arbitrary acts of State Legislatures, to which we think, however, he is inclined to give too much weight in accounting for the distrustful attitude of the investing public toward railway securities.

This reminds us that Mr. Hill should have inspected the record of new issues of stocks, bonds and notes before asserting that railway credit had been impaired. The issues authorized since January 1 amount to $1,106,000,000, against only $882,000,000 in the same months of last year, and about $900,000,000 of the total is for railroads. Their credit is not ruined, although, like other borrowers, they have been obliged to pay increased rates for the money.

While we find much in Mr. Vanderlip's address to admire and commend, it seems to us that he underestimates the influence of certain events and revelations in exciting distrust with respect to railway financial and physical management, and in causing what he calls the timidity of capital in relation to railway securities. This is a matter of some importance, because a fair apportionment of the influence among the several causes of it may hasten that readjustment upon a basis of honest dealing which is so much to be desired.

Two-cent passenger rate laws, usually ill-considered and unwise, have alarmed stockholders. Magazine articles, sometimes inaccurate or not wholly just, have aroused, as he says, the suspicions of the public in regard to the integrity and good faith of men in positions of power. But the confidence of the people in railway officers and railway management has been most profoundly shaken, not by the magazine articles of sensational writers, not by any tendency toward hasty and unwise acts in State legislatures, but by the unquestioned public record of official investigations and of court judgments as to the offenses of railway companies and railway officers of great prominence.

Official proof of rank discrimination that has created and maintained monopolies and crushed independent producers in the oil trade, in the mining of coal and in other industries; the stealing of great tracts of public land, shown by legal evidence and even by confession; rebating, punished in scores of cases by the courts after trial, and sometimes after admis-

sion of guilt; the wholesale corruption of influential officers by gifts of stock designed to procure favors unjustly and at the expense of competitors; the disclosures of the Union Pacific investigation—these, and such as these, have been the main causes of public distrust, of the impairment of public confidence. The people have come to believe, upon the evidence of official investigations and of court decisions in criminal cases, that the men controlling certain great railways have managed them from brokers' offices, with both eyes fixt upon the tape that records the prices of transactions on the Stock Exchange; that they have shaped dividends for purposes of speculation; that, in short, they have been intent upon private gain and the accumulation of great private fortunes by improper methods.

Hundreds of volumes would be required for the records of official investigations concerning railroad offenses, and of successful criminal suits against railroad officers, during the last two years. And where can there be pointed out a convicted or an exposed officer of any prominence whose conviction or exposure has been followed by dismissal? Have they not, as a rule, been retained in the service by boards of directors? This leads the public to believe that the entire management, in each case, is tainted.

We would not have it inferred by those who have not read Mr. Vanderlip's address that he ignores these causes of public distrust. In a general way he touches upon nearly all of them, and we presume he did not intend to omit any. But we do not think he gives to them their actual weight, as compared with the weight of others.

He has been led by the opinions of well-informed business men to think that there is soon to be some recession in trade, altho there is, in the condition of agriculture, industry or finance, no inherent reason that would make necessary such a recession. "The public mind and temper" will determine whether the period of depression shall be brief or protracted. If the intricate problem of railway regulation "is worked out in a spirit of fairness and intelligence," we shall, in his opinion, resume the road toward further prosperity.

In this matter, fairness on one side tends to beget fairness on the other. The American people desire to be fair. They love fair play. They are convinced—by official investigations, court judgments and the like—that in their dealings with the railroads they have not been treated fairly. They have seen too much discrimination that has enriched some at the cost of the suffering or ruin of others. The railroads can best promote fairness and patient consideration on the part of the people and their legislators by showing clearly their own purpose to be absolutely fair. This purpose will be obscured if they fail to get rid of those responsible officers who have deliberately broken just laws or otherwise exhibited their unfitness for the positions they hold.

Cultivating Dreamfulness

While we are not aware that the word *dreamfulness* has ever been used—the Century Dictionary at least does not give it—tho *dreamful* is common enough, there seems no doubt, in our minds, that the word will be needed if the present situation with regard to illustrated papers for children is allowed to develop in the near future as it has in the near past. It seems to be a favorite refuge of the artist, intent upon interesting children now, to betake himself to dreamland and picture odd things that children are supposed to have seen in their dreams. While long ago Tennyson in the "Lotus Eaters" had the lotus victims sing,

> "Give us long rest or death,
> Dark death or dreamful ease,"

there is no one in these later modern times, and least of all the teacher, or the physcian, who has much to do with children who would crave for them dreamful sleep. Every one knows how unrested he rises after a night full of dreams, and if this is true for adults, it is much more true for children. Their highly sensitive nervous organizations require the complete rest that sleep as absolutely dreamless as possible alone will give them, and they will inevitably suffer serious detriment to the development of their nervous organizations if both night and day are to see the active employment of their imaginations.

Almost needless to say the benefit to be derived from the picture supplements of the Sunday papers, to which especially we refer, is more than dubious, while the positive disadvantages seem to be easy to appreciate at once. These crude pictures, badly drawn, luridly colored, with little or no meaning to them at best, and often meanings that are not good for children at worst, cannot help but vitiate taste and deprave intelligence. It does not seem quite the proper thing that children should be shown the humor of playing tricks on anybody and everybody, parents and friends, relatives and servants, sometimes the old, often those who are helpless, and almost be taught to laugh at the predicaments they place them in, as if this were the right thing. This side of the evil, however, we are, in Ciceronian phrase, passing over for the moment simply to emphasize the physically pathological effect of the nervous erethism, which results from the cultivation of the imagination to a high degree, and the suggestion as to the recurrence of the figures thus seen in actual dreams, in such a way as to make them almost sure to appear, whenever the child has gone, as unfortunately the modern child only too often does go, to bed in a highly excited state, because of the notice that it has been allowed to attract from its elders during the evening.

Physicians generally are convinced that there is entirely too much stimulation of the nervous system of children in our present life. They are not allowed to live the simple life enough. Healthy association with those of their own age is replaced too much by stimulating contact with the grown-ups, many of whom are strangers, and the meeting with strangers is apt to take a good deal out of children. Play is not spontaneous enough to make them forget themselves, and their self-consciousness is rather cultivated than rendered as latent as possible. These picture papers, then, are an added factor in this. When they encroach upon the children's hours of sleep, as well as wakefulness, with their ill effects, it seems time to call a halt. Ask any physician and he will tell you that the precocious child, much in contact with its elders, and given to picture-paper absorption, is more subject to "night terrors" than the natural child, who takes its recreation in muscular, not mental, ways. There are specialists in children's diseases who have even suggested that the reason why "night terrors" are a little more frequent on Sunday and Monday nights, as they seemed to be, is not alone because of the greater variety of food likely to be consumed at dinner on Sunday, but also and especially because poring over the colored supplement of the Sunday paper has been one of the absorbing occupations of the day of rest.

We are entering upon the season when children are home from school and the kindergarten and more directly under the eyes of the parents. It is at this season that the unconscious education of the child goes on apace and that the colored supplement means more to it even than before. The unconscious factors of education in our modern life, the newspaper, and the conversations that subjects made much of in the daily press are likely to suggest, and that so readily find their way into the large ears of these little pitchers; the theater, with its connotations, in the same way; the summer books that are read; all these are quite as important as the more formal factors of education. This seems to be an excellent time, then, to call attention to the dangers that lurk behind the apparently harmless, tho it would scarcely be called innocent amusement, that is afforded to children by the vicious colored supplement.

Secretary Taft's Boom

Secretary Taft has returned from the West, and does not seem to have done much to strengthen his claim to the Presidential succession. Indeed he has made no speeches that have any definite marked policy. Perhaps he does not wish to run for the office. If he did we should have expected some speech in which he would forcibly present to the nation the platform which he would stand on. We are not surprised that some people are saying that he would rather graduate into the Supreme Court. And yet he keeps on doing his full work, visiting the country and all its outlying possessions, and proving himself an excellent administrative officer. His "boom," however, is not as pre-eminent as it was. Other candidates are coming

to the front, particularly Governor Hughes, and we may mention Senator Knox, altho the way Senator Knox was selected for the Senate would make it impossible for him to secure the nomination for President. And Mr. Taft's chances have been seriously injured by the Brownsville affair. The negroes declare that they will not vote for Mr. Taft, nor for any one else whom President Roosevelt will favor. It is amazing, as it is unjust, that so deep and so general a feeling has been aroused. And the negro vote will be strong enough to control the result in several States, if the Democrats put up a popular candidate. To be sure the negroes may yet be placated, and we see that some of their leaders, who look far enough ahead, are warning them that they may have to take back their stout words. President Roosevent tried to do right in that case, and so did Mr. Taft, and the negro soldiers are not yet exonerated by the evidence.

We have letters in criticism of the article by W. D. Givens on "The Canada of Today" which we need not print, as we have previously published articles showing the prosperity of Western British America. We are informed by one of the replies that thirty-nine years ago the population in all the Canadian provinces was three and a half millions, while this year it was 6,442,581 and is growing. We are told that the immigration from Canada to the United States has well nigh ceased, as those that would formerly have gone to this country now go West. Lord Strathcona expects Canada to have a population at the end of this century as large as that of the British Isles. Our correspondents admit that the Maritime Provinces hardly hold their own, but he reminds us that this is true of some of the New England States. With the increase of population there is a large increase also in the imports and in exports. In 1901 the imports were $181,257,988, and in 1906 $290,300,807.

One of the most curious discoveries of late is that of a treatise by the famous mathematician Archimedes, of Sicily, found on a palimpsest manuscript in Constantinople, entitled "Concerning Method," and published by Professor Heiberg, of Copenhagen. The treatise is addressed to Eratosthenes, and is remarkable for an ingenious application of mechanics to the solution of geometrical questions, and by a very daring use of a method comparable to the integral calculus. Surfaces are in certain conditions considered as the sums of right lines, and the volumes as the sums of their planes. Thus Archimedes appears to be a sort of precursor of Leibnitz and Newton.

There need be no pity for gamblers when they lose, and no congratulation when they win; but there is occasion to say that when such a sum as a million dollars is said to have been lost and won at a single horse race near this city last week, there is indication of a festering moral evil. Horse races are not run to develop the best horse, but to give opportunity for gambling. They favor an inferior horse and put a heavy weight on a good horse, just to equalize chances, and make a bare chance out of the running. Apart from the saloon, there is no greater school of vice existing.

A testimony to the value of the local option laws wherever they exist was given at the meeting last week in Atlantic City of the Liquor Dealers' Association. It appears that they are frightened at the great growth of temperance sentiment, especially in the South, where county after county shuts out the entire liquor traffic, and the association agreed to put all their force into the effort to fight the reform; for, they said, it looks as if the liquor traffic would soon be wiped out in the larger part of the United States by local option.

The negroes of Georgia expect that when Hoke Smith is Governor of Georgia he will attempt to have a law past to limit negro suffrage, and they are waking up to attempt to defeat it. They are urging every negro who has the legal right to vote to pay his poll tax, get registered and then put in his vote against any new Jim Crow law. That is good policy. It is not manly to submit to injustice. The failure to pay one's tax puts on a man the responsibility for any bad law enacted by his negligence.

Insurance

Darwin P. Kingsley, President of the New York Life.

FOLLOWING a contest tremendous in its severity, and which has lasted more than a year, the New York Life Insurance Company has been reorganized under a new board of directors constituted as follows:

John E. Andrus, Yonkers, N. Y.; John Claflin, Morristown, N. J.; Julius Fleischmann, Cincinnati, Ohio; Thomas P. Fowler, N. Y.; David R. Francis, St. Louis, Mo.; Woodbury Langdon, N. Y.; Robert J. Lowry Atlanta, Ga.; Clarence H. Mackay, Roslyn, L. I.; John G. Milburn, N. Y.; Seth M. Milliken, N. Y.; Geo. Austin Morrison, N. Y.; Henry C. Mortimer, N. Y.; Alexander E. Orr, Brooklyn, N. Y.; Augustus G. Paine, N. Y.; Wm. B. Plunkett, Adams, Mass.; Anton A. Raven, Brooklyn, N. Y.; John Reid, Yonkers, N. Y. Fleming H. Revell, N. Y.; Elbridge G. Snow, N. Y.; Hiram R. Steele, Brooklyn, N. Y., and Louis Wagner, Philadelphia, Pa.

DARWIN PEARL KINGSLEY.
Photographed specially for THE INDEPENDENT on June 19.

They represent the "administration" and were chosen by a majority of over 136,000. The new trustees met on Monday of last week and elected as the successor of Alexander E. Orr in the office of president, Darwin Pearl Kingsley. Mr. Kingsley was born at Alburgh, Vt., on May 5th, 1857. His early education was obtained in the common schools. He worked his way thru the University of Vermont, and has received several degrees. He entered the service of the New York Life in 1889 and has held a variety of posts with the company. His experience has been wide and he has passed triumphantly thru the Armstrong investigation. No charge was made against him and he was concerned in no dubious transactions. He has served on all the company's important committees, including the finance, the executive and the office committees. Following his election as president, in addressing his colleagues, Mr. Kingsley said in part as follows:

"Among the problems that face this board in its conduct of the company's affairs, I see nothing more menacing just now than the tendency to pass unreasonable legislation with regard to life insurance in the various States of the Union. These bills largely relate to taxation and involve a constantly increasing drain upon the premiums paid by the policy-holders. Most of the States charge what may properly be be called an income tax. This tax varies in different States. The tax has always been considered in the nature of a franchise tax, one of the conditions on which the company is permitted to solicit life insurance. The result is not only a very heavy and unjust burden upon the thrifty, but, as the tax varies in different States, the injustice is not evenly distributed.

"Finally, it is worth while to notice that life insurance as an institution and as represented by individual companies has passed thru a period of such trial and stress as rarely comes to any business enterprise, and that even in the very heat and fury of public misunderstanding and indignation, no person whose opinion was worth considering even suggested that this company was anything but abundantly solvent and abundantly able to carry out all its pledges. It is certainly fair to say that this is not the result of an accident, because this condition is not found to exist in other lines of business when put to corresponding tests. Neither is it fair to say that it inheres in the nature of the business itself.

"There is no resisting the conclusion that life insurance, upon the whole, has been soundly and wisely managed. This will inevitably be the conclusion of the general public."

The New York Life from its last statement has assets of $474,567,673.

Financial

Adams Express Profits

WHAT is virtually a dividend of 200 per cent. was declared by the Adams Express Company on the 17th, when announcement was made that the stockholders would receive a bonus of that amount in the form of a distribution of $24,000,000 in new 4 per cent. collateral trust bonds, the company's capital being $12,000,000. These bonds are secured by a deposit of other bonds and stocks bought by the company with its surplus earnings, and the income from the deposited securities is more than enough to pay the 4 per cent. interest. Nine years ago the company made a similar distribution of 100 per cent., and in the meantime it has paid comfortable dividends. This recent cutting of a larger melon appears to have been due to the fact that on and after July 1, under the new Railroad Rate law, express companies will be treated as common carriers and will be required to make detailed statements and to keep accounts as directed by the Interstate Commerce Commission. Such distributions are proof that their profits have been very large. The companies must not be surprised if the public shall insist that their rates are excessive and ought to be reduced, and if new force shall be given to the arguments in favor of the establishment of a domestic parcels post.

Railway Net Earnings

RAILWAY gross earnings have been rising, as we showed last week, and now reports for April point to a large increase of net earnings in that month, the first increase of the year. Net increases dwindled in the last half of 1906 from 17 per cent. in July to only 2 per cent. in December, and in January, February and March there were losses of net, instead of gains, these losses having been, according to *Bradstreet's*, 2.4, 5.9 and .2 per cent. respectively. But in April, altho operating expenses were higher by nearly 23 per cent., a great increase of gross permitted an advance of 25½ per cent. in net. Allowance must be made, however, for the effect of the coal strike in April of last year. But if two-thirds of the increase be crossed off on that account, there remains a gain that is very encouraging when compared with the losses of the first three months of the year.

....Estimates of the probable shortage in Europe's wheat crop have recently been increased. Conservative authorities now think the yield will fall 200,000,000 bushels below last year's.

....The monthly record of immigration into the United States was broken in May, when 184,886 immigrants landed. The monthly average since January 1 has been 117,643.

....Charles H. Stout, vice-president of the Liberty National Bank, has been elected vice-president of the Manhattan Trust Company. He will remain in the directorate of the Liberty National.

....Lower export prices in the German iron and steel trade are expected, owing to a decline of orders for home consumption. The capacity of the German plants has been largely increased in recent years.

....According to the annual report of the Chamber of Commerce, advance sheets of which have been issued, the total foreign commerce of the port of New York in the calendar year 1906 was $1,567,729,735, against $1,374,417,122 in 1905.

....From the earnings of the past year the Fifth Avenue Bank, of which A. S. Frissell is president, declared on the 20th an extra dividend of 100 per cent., in addition to the regular quarterly dividend of 25 per cent. The bank's capital is $100,000.

....A bulletin recently issued by the Canadian Census Bureau shows that Canada's output of manufactures rose to $715,035,965 in 1905, from $481,053,373 in 1900, and $368,696,723 in 1890. Montreal is the leading manufacturing city and Toronto is second.

HAWAIIAN NUMBER

MAY 2 1907

Published at
130 Fulton St — New York
10 Cents a Copy – Two Dollars a Year

A Pure White **"Standard"** Bathroom is the pride of the house-owner and the safeguard of domestic health. Its moderate cost and life-long durability make **"Standard"** Ware the most economical fixtures to instal, whether in a modest or a luxurious home.

Our book, "MODERN BATHROOMS," tells you how to plan, buy and arrange your bathroom, and illustrates many beautiful and inexpensive as well as luxurious rooms, showing the cost of each fixture in detail, together with many hints on decoration, tiling, etc. It is the most complete and beautiful booklet ever issued on the subject, and contains 100 pages. FREE for six cents postage and the name of your plumber and architect (if selected).

CAUTION: Every piece of "Standard" Ware bears our "Standard" "GREEN and GOLD" guarantee label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end. The word "Standard" is stamped on all our nickled brass fittings; specify them and see that you get the genuine trimmings with your bath and lavatory, etc.

United States Supreme Law Decides It

THE Columbia Wins its suits against record makers whose imitations of Columbia Records were declared infringements of the **patented** Columbia Record Making Process by **The U. S. Circuit Court of Appeals.** It is the **Superior Record Making Process** that results in the Superiority of

Columbia Records

Superior in **durability:** they last longer than any other records.

Superior in **tone production:** absolutely free from imperfections and the scratchy sounds that mar the music made by other records.

Superior in perfect reproduction of vocal and instrumental sounds: Every word perfect in **enunciation** — Every note **liquid** and **distinct.**

Superior in every way: No other records are as good **at any price.**

Columbia Records fit all makes of Talking Machines.

Columbia Records sound best on Columbia Graphophones; but if yours is another make, Columbia Records will greatly improve the tone quality of your machine

Your Bath Room equipped with

"Standard" Porcelain Enameled Ware

is an absolute guarantee of perfect sanitation in the home. Wherever **"Standard"** Ware is installed hygienic conditions and immaculate cleanliness follow as a natural consequence. Its one-piece construction, without joints or crevices, insures immunity from the accumulation of impurities. Its snow-white surface prevents the adhesion of dust and dirt. Its iron strength and china smoothness are an assurance of life-long service, and make it the most economical ware to install.

Our Book, "MODERN BATHROOMS," tells you how to plan, buy and arrange your bathroom, and illustrates many beautiful and inexpensive as well as luxurious rooms, showing the cost of each fixture in detail, together with many hints on decoration, tiling, etc. It is the most complete and beautiful booklet ever issued on the subject, and contains 100 pages. FREE for six cents postage and the name of your plumber and architect (if selected).

The ABOVE FIXTURES, Design P-25, can be purchased from any plumber at a cost approximating $175.00—not counting freight, labor or piping—and are described in detail among the others.

CAUTION: Every piece of "Standard" Ware bears our "Standard" "GREEN and GOLD" guarantee label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end. The word "Standard" is stamped on all our nickeled brass fittings; specify them and see that you get the genuine trimmings with your bath and lavatory, etc.

Address **Standard Sanitary Mfg. Co** Dept. **M**, Pittsburgh, U. S. A.

Pittsburgh Showroom, 949 Penn Avenue
Offices and Showrooms in New York: "Standard" Building, 35-37 West 31st Street

Every woman in the home comes under the influence of snowy white

"Standard" Porcelain Enameled Ware

Its absolute sanitation makes it impervious to the accumulation or absorption of dirt and is a constant guarantee of domestic health. The pride of possession and satisfaction of daily usage alone repay the cost of installation, and its indestructibility makes it the most economical bath-room equipment you can install.

Our Book, "MODERN BATHROOMS," tells you how to plan, buy and arrange your bathroom, and illustrates many beautiful and inexpensive as well as luxurious rooms, showing the cost of each fixture in detail, together with many hints on decoration, tiling, etc. It is the most complete and beautiful booklet ever issued on the subject, and contains 100 pages. FREE for six cents postage and the name of your plumber and architect (if selected).

The ABOVE FIXTURES, No. P-26, can be purchased from any plumber at a cost approximating $101.00—not counting freight, labor or piping—is described in detail among the others.

CAUTION: Every piece of "Standard" Ware bears our "Standard" "GREEN and GOLD" guarantee label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end. The word "Standard" is stamped on all our nickeled brass fittings; specify them and see that you get the genuine trimmings with your bath and lavatory, etc.
